

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## JERUSALEM

**JERUSALEM** (Heb., habitation of peace; Sept. *Ἱερουσαλὴμ*; Vulg. *Hierosolyma*; Arab. *El Kuds*, the Holy), a city of Palestine, of which it was anciently the capital, and now the seat of a Turkish pasha. It is the holy city of the Hebrews and Christians, and one of the three holy cities of the Mohammedans, ranking next in sanctity to Mecca and Medina. It is in lat. 31° 46' N., long. 35° 18' E., 128 m. S. S. W. from Damascus, 27 m. E. from the Mediterranean, and 14 m. W. from the Dead sea. Its elevation above the Mediterranean is 2,200 feet, and above the Dead sea 3,708. Population probably about 18,000, of whom 7,000 are Mohammedans, 6,000 Jews, and 5,000 Christians, mostly of the Greek and Latin churches, with a few hundred Armenians, Syrians, Copts, and Protestants. The Mohammedans are mostly of Arab descent, with a few Turks in the employ of the government. The Jews are chiefly of Spanish origin, their ancestors having come from Spain about the beginning of the 16th century. They still speak a corrupt Spanish dialect. There are also some German and Polish Jews. The Jewish community inhabit a particular quarter of the city, and are governed to a great extent by their own rabbinical laws. Their chief rabbi is called in Hebrew "the head in Zion," and his chief interpreter has a seat in the municipal council. The Jews' quarter is badly built and filthy, and the people suffer much from crowded dwellings, scarcity of water, and general poverty. The Greek Christians are Arabs, and speak only the Arabic language, except the superior clergy and the monks, who are Greeks from the Greek islands. The patriarch of Jerusalem is their head. They have 8 convents and 5 nunneries in the city. The Latin Christians or Roman Catholics are principally natives of Syria, seceders from the Greek church, and speak only Arabic. They have a patriarch, who has spiritual oversight of all the Roman Catholic churches in Palestine. The convents, however, are not under his jurisdiction, but are under the superintendence of an abbot or "warder," who is styled "guardian of Mount Zion and keeper of the Holy Land." He is always an Italian, and is appointed by the pope every 3 years. There are

14 convents in Syria subject to him, of which the principal is the convent of St. Salvador at Jerusalem. The Protestant population of the city numbers about 100. An Anglican bishop resides there, with a diocese including Palestine, Syria, Mesopotamia, Chaldea, Egypt, and Abyssinia. This bishopric was established in 1841 by the joint action of the Prussian and British governments. Several Protestant missions are also maintained in the city by churches in Europe and America.—Jerusalem is almost on the summit of a broad, irregular mountain ridge, whose watershed is a little to the westward of the city, so that streams whose sources are but a few miles from its walls flow on the one hand to the Mediterranean, and on the other to the Dead sea. The summit of the mountain ridge is broken into many rugged limestone crowns divided by deep ravines. In the midst of these crowns are two valleys, which at first are only gentle depressions, having between them a stony swell  $\frac{1}{2}$  m. wide, and both of them run E. for a short distance. That on the N. continues E. about 1  $\frac{1}{2}$  m., then sweeps to the S., and soon becomes deep and narrow with precipitous sides. This is the valley of Jehoshaphat, or of the brook Kedron. The other valley, the valley of Hinnom, runs at first about  $\frac{1}{2}$  m. E. by S., turns suddenly S. for  $\frac{1}{2}$  m. and then E., and descending unites with the valley of Jehoshaphat. On the broad high platform between these two valleys stands Jerusalem. The platform itself is divided by another valley, anciently called the Tyropæon, which runs with a slight curve from the N. W. to the S. E., having a high ridge on each side terminating on the S. in abrupt declivities. The city occupies the S. part of these ridges with a portion of the intervening valley; anciently it covered the whole of them. Irregular rounded hills encompass it, rising above the buildings about 200 feet where highest, with openings through which views of the distant country are obtained. On the E. is the Mount of Olives, rising steeply from the valley of Jehoshaphat. On the S. the Hill of Evil Counsel overhangs the valley of Hinnom. On the W. the ground rises gently to the great *wady* or valley of Beït Hanina, whose waters run to the Mediterranean.

On the N. a bend of the ridge, connected with the Mount of Olives, bounds the prospect at the distance of more than a mile. The breadth of the whole site of Jerusalem, from the brow of the valley of Hinnom, near the Jaffa gate, to the brink of the valley of Jehoshaphat, is about 1,020 yards, or  $\frac{1}{4}$  of a mile, of which distance 818 yards are occupied by the area of the great mosque El-Harem esh-Sherif, commonly called the mosque of Omar. The country around Jerusalem is all of limestone formation, and not particularly fertile. The rocks everywhere come out above the surface, which in many parts is also thickly strewed with large stones; and the whole region has a barren and dreary aspect. Yet the olive thrives, and fields of grain are seen in the valleys and level places. Neither vineyards nor fig trees flourish near the city. Jerusalem is surrounded by high walls, built by the Turkish sultan Solymán the Magnificent in 1542. They are 15 feet thick, and vary in height with the inequalities of the ground from 25 to 70 feet. Their total circuit is 4,326 yards, or about  $2\frac{1}{2}$  m. The city is irregular in its outline, but approaches a square whose 4 sides nearly face the cardinal points. It has 5 gates, two on the S. and one near the centre of each of the other sides. On the W. is the Hebron or Jaffa gate, the chief entrance to the city. On the N. is the Damascus gate, on the E. St. Stephen's, and on the S. the Zion gate and an obscure and little used portal called the Dung gate. The streets are narrow, winding, and dirty, and badly paved where paved at all. The houses are well built of limestone, cream-colored and streaked with blood-red, and are for the most part 2 or 3 stories high, with a plain front without windows in the lower stories, and with doors so low that a person must stoop to gain entrance. The roofs are terraced or rise in domes, and the apartments receive their light from interior courts, which in the larger houses form cool and agreeable promenades secluded from public view. The principal apartments are upon the second story, the lower story being occupied by lumber rooms, kitchens, stables, cisterns, and offices.—Ancient Jerusalem, as it existed in the time of Christ, or somewhat later at the time of its conquest by the Roman army under Titus, A. D. 70, is described by Josephus as built upon two hills, between which lay the valley Tyropæon or the valley of the Cheesemakers, to which the buildings on both hills came down. The upper hill was much higher than the other, and was called by King David the Fortress, but Josephus calls it the Upper Market. The other hill, on which was the lower town, was called Akra, and was in the shape of a crescent. Opposite Akra to the S. E. was Moriah, on which stood the temple. Moriah was naturally lower than Akra, from which it was separated by a broad valley; but in the time of Simon Maccabæus Akra was cut down so that the temple rose above it, and at the same time the valley between it and Moriah was filled up. Both the hills on which the upper and

lower towns stood were externally protected by precipices and deep valleys. The ancient city was defended at the time of the Roman siege by three walls, the most ancient of which appears to have enclosed Mt. Zion, part of which is outside of the modern city. The second wall enclosed the whole of Akra excepting that part of its E. side which fronted the temple area on Mt. Moriah, and the S. side toward the valley which separated the lower from the upper city. In the first century of the Christian era, the city having extended northward beyond the second wall, a third wall was built to protect this suburb, which was called Bezetha. The total circumference of the ancient city, according to Josephus, was about  $8\frac{1}{2}$  m. With regard to the details of the ancient topography there is much uncertainty, and great controversy. One of the most recent investigators, the Rev. Dr. Thomson, after nearly 25 years' residence in Palestine, says: "It is my own decided impression that no ingenuity can reconstruct the city as our Saviour saw it, or as Josephus describes it. No man on earth knows the line of the E. and S. E. portions of the first wall, nor where the second began, nor how it ran after it began, nor where the third wall commenced, nor one foot of its circuit afterward; and of necessity the locations of castles, towers, corners, gates, pools, sepulchres, &c., &c., depending upon supposed starting points and directions, are merely hypothetical. One hypothesis may have more probability than another, but all must share the uncertainty which hangs over the data assumed by the theorizers."

—The most striking view of Jerusalem is from the summit of the Mount of Olives, about half a mile E. from the city, which it completely overlooks, every considerable edifice and almost every house being distinctly visible. The city, seen from this point, appears to be a regular inclined plane, sloping gently and uniformly from W. to E. or toward the observer, and indented by a slight depression or shallow vale running nearly through the centre in the same direction. The S. E. corner, that which is nearest to the observer, is occupied by the great mosque and its extensive and beautiful grounds, covering Mt. Moriah, the site of the ancient temple, and comprising about one eighth of the whole of the modern city. It is covered with greensward, and planted sparingly with olive, cypress, and other trees, and is the most beautiful feature of the town. The S. W. quarter, embracing that part of Mt. Zion which is within the modern town, is to a great extent occupied by the Armenian convent, an enormous edifice, which is the only conspicuous object in this neighborhood. The N. W. is largely occupied by the Latin convent, another very extensive establishment. About midway between these two convents is the castle or citadel. The N. E. quarter of Jerusalem is but partially built up, and it has more the aspect of a rambling agricultural village than of a crowded city. The vacant spots here are green with

gardens and olive trees. There is another large vacant tract along the S. wall, and W. of the Harem esh-Sherif, also covered with verdure. Near the centre of the city also appear two or three green spots which are small gardens. The church of the Holy Sepulchre is the only conspicuous edifice in this vicinity, and its domes are striking objects. There are no other buildings which either from their size or beauty are likely to engage the attention. Eight or ten minarets mark the position of as many mosques in different parts of the town, but they are only noticed because of their elevation above the surrounding edifices. For the same reason the eye rests for a moment upon a great number of low domes, which form the roofs of the principal dwellings, and relieve the heavy uniformity of the flat plastered roofs which cover the greater mass of more humble habitations. The Harem esh-Sherif, the "Noble Sanctuary," forms the most conspicuous feature of the city, and is one of the most sacred temples of the Mohammedan world. It is a quadrangle 1,489 feet long by 954 broad. It contains two mosques, the oldest of which, El Aksa, was originally a Christian church built by the emperor Justinian about the middle of the 6th century, and is 272 feet long by 184 wide. The other mosque, Kubbet es-Sukhras, or the "Dome of the Rock," stands on the very summit of Mt. Moriah, and is built over a singular projecting rock, which is supposed to be the "threshing floor of Araunah the Jebusite," where David sacrificed, and afterward the site of the great altar of burnt offering in Solomon's temple. By the Mohammedans it is regarded with the highest veneration, their traditions saying that Mohammed called it one of the rocks of paradise, and they believe that from it he made the ascent into heaven narrated in the Koran. The building is an octagon, each side of which measures 67 feet. It is surmounted by a peculiarly light and graceful dome terminated by a tall gilt crescent. The entire building forms one of the finest and most celebrated specimens of the Saracenic style of architecture. Its erection is commonly ascribed to the caliph Omar about 650, but some of the Arab historians state that it was built by the caliph Abd el Malek in 686. An eminent English writer on architecture, Mr. Fergusson, maintains that it was built by the Roman emperor Constantine in the earlier part of the 4th century over the sepulchre of Christ. This opinion, however, finds few supporters. The people of Jerusalem itself, and the majority of those who have written on the topography of Jerusalem, believe that the sepulchre is in the middle of the N. W. quarter of the city. The church of the Holy Sepulchre, built by Constantine or his mother Helena, is 300 feet long and nearly 200 feet broad, and is supposed to include within these limits the scene of the crucifixion, entombment, and resurrection of Christ. The general plan of the church is a rotunda divided and elongated; that is, the sides of the church are parallel, and the ends semi-circles; the

eastern semi-circle is smaller than the western. The main entrance is in the S. side of the church. On entering, the pilgrim finds immediately at his right hand a chamber, the roof of which is the floor of a chapel. This chamber has on the right and left the tombs of Godfrey and Baldwin, between which the pilgrim passes to the chapel of Adam, a small room ending against the native rock. In this rock is visible a huge fissure, said to have been made by the earthquake at the time of the crucifixion. This rock, ascending through the roof of the chamber, is the supposed site of Calvary. Outside the room, two staircases lead up to the floor of the chapel above it, which is the chapel of Calvary or of the Elevation of the Cross; within this the pilgrim is permitted to approach, on his knees, a hole in the rock usually covered with a silver plate, in which he is told the cross of Christ was set. In front of the great doorway, and within the church, is a large smooth slab of the native stone of the floor of the church, which is called the stone of unction, and is pointed out as the spot where the body of Christ was laid by Joseph to be anointed for burial. This lies between Calvary and the tomb; passing it, the pilgrim enters the great semi-rotunda in the W. end of the church, in the centre of which, under an open unglazed dome, is the holy sepulchre. This is enclosed in a beautiful chapel of various-colored marbles. The first room is the chapel of the Angel; from this the pilgrim enters, by a low passage, a sepulchral chamber 6 feet 2 inches long by 6 feet wide, having an arched roof about 7 feet high; one half of this is occupied by a stone couch, covered with a marble slab. This entire tomb is said to be carved in solid rock, and it is claimed for it that this is the identical tomb in which the body of Christ lay, on the couch now hidden from view by the slab; others deny that the tomb is solid rock, and affirm that it is all a constructed building. In the chapel of the Angel is shown a fragment of stone said to be part of the stone rolled away by the angels. Another and larger fragment is claimed and exhibited by the Armenians in a chapel on Mt. Zion. In galleries around the church, and in small buildings attached to it on the outside, are apartments occupied by a number of monks of various nations, who are devoted to the service of the sepulchre, and in Passion week perform there a variety of ceremonies which annually attract a large crowd of pilgrims. Concerning the authenticity of these sacred places a great deal of controversy has existed and is still kept up. Dr. Robinson, in his "Biblical Researches," arrives at the conclusion "that the genuineness of the present site of the holy sepulchre is supported neither by well authenticated historical facts, nor by prior tradition, nor by archaeological features." His main argument to this effect attempts to show by the topography of Jerusalem that the present locality of the sepulchre was within the walls of the city at the time of the crucifixion, and consequently could not be near

the place where Christ was crucified, which is stated in the Gospel to have been without the gates. Most Protestant and a few Catholic investigators agree substantially with Dr. Robinson; while on the other hand the great majority of Catholics and some Protestant travellers believe in the genuineness of these remains. Among others, Mr. William O. Prime, a recent American traveller, maintains the authenticity of the sepulchre on the following grounds: "It is not credible that this locality was forgotten by Christians within 800 years after the great events of the crucifixion, burial, and resurrection. Critical scholars and learned men, employed in investigating the topography of the Holy Land, had no doubt of its authenticity in the beginning of the 4th century; no one, so far as we know, thought in that age of disputing the fact, but all men acknowledged its truth; it is not doubted by any one that this is the locality in which those learned men placed their confidence, it having been well preserved from that time to this." Some of the convents of Jerusalem are large and well built edifices. The first in size is the Armenian convent, which is the residence of the patriarch of that sect, who lives in a considerable degree of state and luxury. The Latin convent, belonging to the Franciscans, is also very extensive, and resembles a fortress. It accommodates great numbers of pilgrims, and is supported by donations from the Catholic countries of Europe. The hills and valleys around Jerusalem are thickly studded with ancient tombs, among which may be mentioned the tomb of David, now covered by a Mohammedan mosque, the tomb of Absalom, and the tomb of Helena (commonly called the tombs of the kings), a queen of Adiabene, who became a proselyte to Judaism in the 1st century. Many of these tombs are excavated to a considerable depth in the rocky hill sides, and are curious and interesting monuments.—Jerusalem is the seat of little trade, though it is a central point for the caravans between Arabia, Egypt, and Syria. Its only manufactures are of soap, oil of sesame, and beads, crosses, shells, and models of the holy sepulchre, which, after receiving a sort of benediction, are exported in considerable quantities to Greek and Catholic countries. The bazaars are scantily supplied with provisions, tobacco, coarse cottons, and other articles of necessity.—Jerusalem is mentioned very early in Scripture, it being commonly supposed to be the Salem of which Melchisedek was king in the time of Abraham. The mountain of the land of Moriah, to which Abraham went to offer up Isaac as a sacrifice, is supposed to have been the Mt. Moriah afterward occupied by the temple and now by the great Mohammedan sanctuary. The name Jerusalem first occurs in Joshua x. 1, where Adoni-zedek, king of Jerusalem, is mentioned. It was at that time a strong city, inhabited by the Jebusites. The Israelites after the death of Joshua attacked it and took the lower city, but could not drive out the Jebusites from

the fortress on Mt. Zion, which they held for several generations, until it was at length captured by David, who made it his residence and the capital of the Hebrew kingdom. His successor Solomon built the famous temple, and otherwise embellished the city. After his death the importance and splendor of Jerusalem were considerably lessened by the revolt of the 10 tribes, which left it the capital of only the very small state of Judah. Under King Rehoboam, 971 B. C., it was taken by Shishak, king of Egypt, who plundered the temple of its treasures. It was subsequently conquered and pillaged by Jehoash, king of Israel, and was afterward enlarged and beautified by Uzziah, Jotham, Hezekiah, and Manasseh. In 598 B. C., and again in 588, the city was besieged and taken by the Babylonian conqueror Nebuchadnezzar. The second siege lasted 8 years, and on its termination the Babylonians burned the temple and the palaces, razed the walls, and carried away captive Zedekiah, the last king of the house of David, together with many of the people. In 536 Cyrus, king of Persia, having conquered Babylon, permitted the Jews to return to Jerusalem and rebuild the temple. The city, however, remained without walls until 444 B. C., when Nehemiah was appointed governor by the Persian monarch Artaxerxes, and began to restore the fortifications. From this time till the conquest of Syria by Alexander the Great (332) the history of Jerusalem is obscure, though the city seems to have been peaceful and prosperous under the dominion of its Persian masters. According to Josephus, it adhered to the Persians during the Macedonian invasion; and when Alexander advanced against it with hostile intent, his wrath was averted by the high priest Jaddua, whom he recognized as a personage he had seen in a dream. The Greek historians of Alexander, however, make no mention of this movement against Jerusalem. After Alexander's death, Ptolemy, king of Egypt, attacked Jerusalem on the Sabbath when the Jews would not fight, plundered the city, and transported many of its inhabitants to Egypt. It soon regained its prosperity, however, and flourished under the dominion of the Ptolemies as a province of Egypt till 198, when it submitted to Antiochus the Great, king of Syria, by whom it was treated with indulgence and favor. Under one of his successors, Antiochus Epiphanes, the Jews were persecuted and rebelled; and in 169 Antiochus massacred the people of Jerusalem, destroyed the walls, defiled the temple, and, placing a strong garrison in a citadel which he built, prohibited the Jewish worship altogether, and punished severely those who refused to sacrifice to Greek idols. This persecution caused the revolt of the Jews led by the Maccabees, who after a fierce struggle obtained possession of Jerusalem in 168 B. C., though the citadel remained in the hands of the Syrian garrison till 143. The next remarkable event in the history of Jerusalem was its capture by the Romans under Pompey in 63 B. C., when 12,000 of the citizens were slain and

the walls demolished. They were rebuilt in 48 by Antipater, under whose son Herod the Great the city was enlarged and adorned with magnificent structures, the temple being rebuilt on a much more splendid and extensive scale than that of Solomon. Jerusalem at this time seems to have reached the summit of its greatness, and, it is conjectured, may have contained 300,000 inhabitants in its lofty and closely compacted dwellings. This period is marked by the most memorable events in its history, the birth, ministry, and crucifixion of Christ. About 40 years after this latter event the tyranny of the Romans drove the Jews to revolt, and in A. D. 66 Jerusalem was taken by the insurgents, and a Roman army commanded by Cestius Gallus, governor of Syria, was routed in a battle before its walls. Titus, the son of the emperor Vespasian, regained it in 70, after one of the most terrible sieges recorded in history. The temple was burned and the city razed to the ground, the Romans leaving only 3 towers and a part of the wall to show how strong a place their arms had overthrown. In 131 the emperor Hadrian ordered the city to be rebuilt. The Jews, apprehending that pagan idols would be set up in their holy places, broke into rebellion and took Jerusalem, which the Romans regained only after a protracted and sanguinary contest. They then finished the rebuilding of the city, and, calling it *Ælia Capitolina*, made it a Roman colony, and forbade the Jews to approach it on pain of death. It continued to be known by its new name till the time of Constantine, whose mother Helena made a pilgrimage to it in 326. The emperor Julian repealed the edicts which forbade the Jews to enter Jerusalem, and permitted them in 362 to begin to rebuild the temple; but his death soon after put an end to the project, and the edicts against the Jews were renewed, except that once a year they were allowed to enter the city to wail over the desolation of their temple and their holy city. In 451 Jerusalem was made the seat of a patriarch. Justinian, who became emperor in 527, repaired and enriched its churches, founded many convents, and built a church dedicated to the Virgin on Mt. Moriah. The city had now become a place of great resort for pilgrims from all parts of Christendom. In 610 it was stormed and greatly damaged by the Persians, and in 637 it was taken by the Mohammedans under Caliph Omar. It remained in possession of the Arabs till 1073, when it was taken by the Seljookian Turks, whose cruel treatment of the Christian pilgrims created great excitement in Europe, and led to the first crusade for the recovery of the holy sepulchre from the infidels. Shortly before the crusaders under Godfrey reached the city, the Seljooks had been driven out by the Arab sultans of Egypt. The crusaders took the city by storm, July 15, 1099, and made it the seat of a Christian kingdom, which lasted till 1187, when it was conquered by the Egyptian sultan Saladin. In 1229 it was restored to the Christians by a treaty made between the

Mohammedans and the German emperor Frederick II. In 1239 it was again taken by the Mohammedans, who in 1248 again restored it to the Christians. In 1244, however, it was stormed by the Khorasmians, and has ever since been held by Mohammedan masters. For several centuries it declined in importance under the sway of the Mameluke sultans of Egypt, and in 1526 passed with Egypt and Syria into the hands of the Ottoman Turks. From that period till the present time it has remained a part of the Turkish empire, and has been subject to few vicissitudes. In 1832 it submitted to the army of Mehemet Ali, the pasha of Egypt, but was restored to the sultan in 1841. —Almost our only sources of knowledge of ancient Jerusalem are the Bible and the works of Josephus. The Greek and Latin writers scarcely do more than mention the city. Modern Jerusalem has been described by Maundrell, Clarke, Châteaubriand, Richardson, Niebuhr, Wilde, Lamartine, Buckingham, Poujoulat, Olin, Prime, &c. See also Bartlett's "Walks about the City and Environs of Jerusalem" (8vo., London, 1844), Williams's "Holy City" (8vo., London, 1845), and "Robinson's "Biblical Researches" (3 vols. 8vo., Boston, 1856).

JERUSALEM, JOHANN FRIEDRICH WILHELM, a German theologian, born in Osnabrück, Nov. 22, 1709, died Sept. 2, 1789. He was appointed in 1740 preacher to Duke Charles of Brunswick, and in 1742 became tutor of the hereditary prince. In 1752 he was placed in charge of a theological seminary established by the Protestants in the former convent of Ridagshausen. He declined the appointment of chancellor of the university of Göttingen, and became in 1771 vice-president of the consistory at Wolfenbüttel. He still bears the reputation of having been one of the best preachers of Germany. He was the father of the unfortunate Karl Wilhelm Jerusalem, whose suicide suggested to Goethe the catastrophe of the "Sorrows of Werther."

JERVIS, SIR JOHN, earl of St. Vincent, a British admiral, born in Meaford, Staffordshire, Jan. 9, 1734, died March 15, 1823. He entered the navy at the age of 10 years, and became post-captain of the Gosport of 40 guns in 1760, and in 1774 of the Foudroyant. He distinguished himself in several naval engagements, was made C. B. in 1782, and during the same year sailed with Lord Howe to the relief of Gibraltar. He was promoted to the rank of rear admiral in 1787, and was in parliament from 1782 until the beginning of the French revolution, when he sailed to the West Indies and captured Martinique and Gadeloupe. He was appointed admiral of the blue, June 1, 1795, and on Feb. 14, 1797, off Cape St. Vincent, defeated a Spanish fleet which was nearly twice as strong as his own. For this he was raised to the peerage by the title of earl of St. Vincent and Baron Jervis of Meaford, receiving a pension of £3,000. He became first lord of the admiralty in Feb. 1801, but was removed from office by Pitt in May, 1804. He took command of the channel fleet in 1806, holding it

however only for one year. In 1810 he appeared for the last time in parliament, when he spoke strongly in censure of the conduct of the war.

JESI, SAMUELE, an Italian engraver, born in Milan about 1789, died in Florence, Jan. 17, 1858. He was a pupil of Longhi, and first brought himself into notice by engravings of St. John and St. Stephen from Fra Bartolomeo's pictures in the cathedral at Lucca. Subsequently he devoted himself chiefly to the works of Raphael, of whom he is considered one of the most sympathetic copyists. His *chef d'œuvre* are the portraits of Leo X. and Cardinals Rossi and Giulio de' Medici, from the original in the Pitti palace, which is said to have occupied him 5 years. His engraving of Raphael's "Virgin with the Vine" is one of the choicest productions of the graver in modern times. During his later years he gave much attention to the process of engraving in chalk, for instruction in which he formed a school.

JESSAMINE, a central co. of Ky., bounded S. by Kentucky river; area, 160 sq. m.; pop. in 1850, 10,249, of whom 3,825 were slaves. It has a somewhat diversified surface, with a soil of more than ordinary richness. The productions in 1850 were 725,891 bushels of Indian corn, 134,750 of oats, 1,568 tons of hemp, 4,800 lbs. of tobacco, and 87,153 of wool. There were 11 grist mills, 17 saw mills, 16 churches, and 601 pupils attending public schools. The Lexington and Covington railroad passes through the county. Capital, Nicholasville.

JESTER. See FOOL.

JESUITS, or THE SOCIETY OF JESUS (*Societas Jesu*), the most celebrated and influential among the religious orders of the Roman Catholic church, founded by St. Ignatius Loyola. When studying at the university of Paris, Ignatius united himself (1534) with Le Fèvre (Faber), Francis Xavier, Laynez, and 6 other young men, to make a pilgrimage to Palestine, and to labor there for the conversion of the Saracens. Thwarted in this design by a war between the emperor Charles V. and the Turks, Ignatius, Laynez, and Faber went to Rome, threw themselves at the feet of the pope, and asked him to employ them for some other good work. In 1539 Ignatius convoked all his associates, who were scattered in various parts of Italy, and laid before them the plan of a new order, whose members, beside taking upon themselves the three usual vows of poverty, chastity, and obedience, also bound themselves by a fourth vow to go without hesitation wherever the pope might send them in order to labor for the salvation of souls. On Sept. 27, 1540, the order was confirmed by Pope Paul III. The membership was at first limited to 60, which provision was, however, repealed in 1548. Ignatius was elected the first general, and took up his abode in 1541 at Rome, where he died in 1556. In 1545 the order received great privileges, and in 1571 all the rights of the mendicant orders.—The constitution of the Jesuits differs in many points from that of the other re-

ligious orders. The principal share in framing it has been attributed by some to Laynez. It was originally written in Spanish, but soon translated into Latin, and published for the first time in 1558. A very strict examination precedes the reception of new members, and 5 points are designated as absolute impediments to admission, viz.: the commission of murder, apostasy, or other grievous offences, subjection to a degrading sentence, membership in a monastic order, marriage, and insanity or decided weakness of intellect. The novitiate lasts two years, during which the novices are not allowed to study, but devote their entire time to prayer and prolonged meditation. The "Spiritual Exercises," composed by Ignatius in 1522, are their principal guide. Their fitness is tried by many severe tests. After the expiration of the two years the novice may offer himself for reception into the society, takes the vows of poverty, chastity, and obedience, and is admitted among the scholastics. In this second stage of his religious life he generally devotes 15 or 17 years to study and teaching in the colleges of the order, first studying belles lettres, rhetoric, philosophy, the physical and mathematical sciences, then teaching in succession various branches, beginning with the lowest class, and at last pursuing for 4 or 6 years the study of theology and the oriental languages. The course of these studies was regulated by the *Ratio Studiorum*, first published in 1586, revised in 1599, and again in 1832 (*Ratio atque Institutio Studiorum Societatis Jesu*, Rome, 1832). After the completion of his studies, the candidate performs a second novitiate, lasting one year, during which he lives in retirement, in order to receive the last preparation in "the school of the heart" (*in schola affectus*). Only occasional light duties of the ministry interrupt his solitude. He has to make himself thoroughly acquainted with the constitution of his order, and a detailed report on his progress in virtue and science is made by his superior to the general of the order, who in accordance with this report admits him to the rank of either *coadjutor spiritualis* or *professus*. The coadjutors have, on the whole, the same rights as the *professi*, but cannot take part in the provincial and general congregations of the order, and cannot be elected to a higher office than the rectorate of a college. The professed members, in whose hands the supreme government of the order lies, take upon themselves the fourth vow, to go as missionaries wherever the pope may send them. Beside the above classes of members, there are also lay coadjutors, who are received for domestic employments. At the head of the order is a general, who has a more absolute power than the generals of other religious orders. He is elected for life, appoints nearly all the officers of the order, and receives monthly reports from the provincials, and quarterly reports from the superiors of the professed houses, the rectors of the colleges, and the masters of the novices. Every third year the catalogues of every province, with detailed reports on the capacity and

conduct of every member, must be sent to him. The order is divided into provinces. A province is governed by a provincial, a professed house by a *præpositus*, a college by a rector, a residence by a superior. A provincial congregation consists of all the professed members and such coadjutors as are rectors of colleges. A general congregation meets only for the election of a new general or for deliberating on subjects of very great importance, such as the dissolution or transfer of houses or colleges. It consists of all the provincials and two delegates from every provincial congregation. The general congregation which elects a new general elects also a monitor, whose duty it is to observe the conduct and actions of the general, and, if necessary, to admonish him, and a certain number of assistants (originally 4 for Spain, Portugal, Italy, and Germany, afterward 5, one being added for France, and still the same, one being now appointed for Great Britain and her colonies and the United States, and none for Portugal), whose advice the general is bound to seek. The Jesuits wear no monastic habit, but dress in black, nearly like secular priests. Two popes (Paul IV. and Pius V.) and one general (Francis Borgia) wished to assimilate the Jesuits in some points more to the other religious orders, in particular by introducing the observance of the canonical hours; but this was soon given up, and the whole energy of the order directed to laboring in behalf of the church by means of education and missions.—The order spread with unparalleled rapidity, so that it was said to have had no period of youth. At the death of Ignatius there were 1,000 members in 12 provinces; soon after the death of Acquaviva, in 1618, 18,000 members in 32 provinces; in 1749, 24 professed houses, 669 colleges, 176 seminaries, 61 novitiates, 385 residences, 278 missions in Protestant and pagan countries, and about 23,600 members. In Portugal it was introduced as early as 1540 by St. Francis Xavier and Rodriguez, who found a zealous patron in King John III. Rodriguez established a college at Coimbra, which in 1544 counted 60 members. A considerable number of young noblemen prayed for admission, and thus the order soon became influential. In Spain the Jesuits had at first to overcome the opposition of several bishops, but the patronage of Francis Borgia, at that time governor of Barcelona, soon procured for them a favorable reception and a number of houses and colleges, and at the university of Salamanca they received some of the theological chairs. In France, where they likewise appeared as early as 1540, they met with a very decided resistance on the part of the parliament, the university of Paris, and many bishops. They could not secure a legal existence until 1602, when they were recognized as "fathers of the college of Clermont." The parliament at first refused to register the royal patent, but had at length to yield to the order of the king. They were unable, however, to overcome the

opposition of the parliament and the Sorbonne. When Châtel, who had studied in one of their colleges, made an attempt against the life of Henry IV., they were expelled from France by a decree of the parliament in 1594, and Father Guignard, who was accused of having approved the attempt of assassination, was put to death. Henry IV. himself recalled them in 1603, and from that year they remained in the undisturbed possession of their property. They enjoyed the confidence of Louis XIII., Cardinal Richelieu, and Louis XIV., and were the principal combatants against the doctrines of the Jansenists. Their colleges were very numerous, and among their pupils were Descartes, Bossuet, Corneille, and Voltaire. Two Jesuits were sent to Ireland as papal nuncios under the reign of Henry VIII. Elizabeth expelled them from her dominions, and forbade them, upon penalty of death, to return. We find them, nevertheless, again as missionaries under the reign of James I., and after the discovery of the gunpowder plot (1605) Father Garnet, to whom the plot had been communicated in the confessional, was put to death. (See the proceedings of this trial in vol. ii. of "Criminal Trials," published by the society for the diffusion of useful knowledge.) In 1678 Titus Oates charged them with having entered into a conspiracy against Charles II. and the state, in consequence of which 6 Jesuits were put to death. In spite of several decrees against the public exercise of the Roman Catholic religion in England in general and the residence of Jesuits in particular, the society maintained itself there, although it never became very numerous. The Jesuits first appeared in Germany in pursuance of a call of Ferdinand I. of Austria (1551). They received chairs at the Bavarian university of Ingolstadt and colleges at Cologne (1556), Munich (1559), Treves (1561), Augsburg (1563), and several other places. In Italy they spread more rapidly and more extensively than in any other country. They were banished from Venice, however, in 1604, and the popes did not succeed until 1656 in causing their restoration. A war between France and Charles V., during which all Spaniards were ordered to leave France, brought some Jesuits to the Netherlands, soon after the foundation of the order. They gained a firm footing under Philip II., although the bishops showed them less favor than in other countries. In Transylvania they were favored by Prince Christopher Báthori and his son and successor Sigismund, but the assembly of the states compelled the latter prince (Dec. 16, 1588) to sign a decree of banishment. They became very numerous in Poland, which they divided before the end of the 16th century into two provinces, and where they had houses and colleges in 20 towns. In Sweden they made great efforts, under John III. and Sigismund, to restore the sway of the Roman Catholic church, but the dethronement of Sigismund in 1602 destroyed their hopes. In Russia favorable prospects seemed to open for them with the

reign of Pseudo-Demetrius, but the fall of this prince involved that of the Jesuits.—The missionary activity of the Jesuits among the pagans commenced in 1541, the year after the foundation of the order. Francis Xavier sailed in that year to the East Indies, founded a college at Goa, preached in Travancore, Malacca, Macassar, the islands, and Japan, and baptized a vast number of pagans. Other members of the order preached in Madura, Ceylon, and many other places, and the Christian population of their missions in India rose to 100,000. Some members of the order, especially Robert de Nobilibus, appeared as Brahmins, and tried to excel the Hindoo Brahmins as sages and penitents, regarding this as the most efficient means of obtaining the confidence of the Hindoo population. The mission in Japan was commenced by Francis Xavier in 1549; several princes were converted, and some natives were received into the society. In 1613 the Portuguese Jesuits had in Japan 2 colleges, 8 residences, and 3 professed houses; but the persecution which soon after broke out against the Catholics put an end to their establishments. Their last member, a native of Japan, was put to death in 1636. Father Rogerius penetrated into China in 1584, disguised as a merchant. Ricci established a reputation as one of the best Chinese scholars. Others became the teachers and ministers of several emperors. In 1692 they obtained a decree by which Christianity was declared to be a sacred law and the missionaries virtuous men. The number of converts was very large, and amounted in the province of Nankin alone to 100,000. But a controversy with several other orders on the conformity of the Jesuits to the pagan customs in China and India was decided by the pope against the Jesuits, and proved a fatal blow to the prosperity of their missions in these countries. Cochin-China (1614) and Tonquin (1627) became likewise missionary fields for Jesuits; the congregations in Tonquin in 1640 numbered 100,000 members, but they were cruelly persecuted. The most celebrated of the Jesuit missions was that established in Paraguay, where they Christianized and civilized an Indian population of from 100,000 to 200,000 souls. With the consent of the Spanish authorities they retained the civil dominion over the Indians, and their principles of government have been highly extolled by many who in other respects were their opponents, as Montesquieu, Muratori, and Southey, while many of their admirers have represented Paraguay under the sway of the Jesuits as more free from vice and corruption than any other state of modern times. The prosperity of these missions was interrupted in 1750, when Spain ceded 7 parishes to Portugal, and the Indians, with an army of 14,000 men, resisted the execution of this project. After some time, however, the former state of things and the dominion of the Jesuits were restored, both of which continued until the suppression of the order in Spain. In 1866 they were sent to Florida, which in the

following year was formed into a vice-province of the order, and a school for the children of the Florida Indians was commenced in Havana (1568). On the invitation of a Virginian chief, called by the Spaniards Don Luis, Father Segura, the vice-provincial, with 7 members of the order and some Indian youths who had been educated at Havana, undertook to establish a new mission on the banks of the Chesapeake, or St. Mary's bay. But the Indian proved to be a traitor, and Father Segura with all his companions except one lost their lives (1570). This led the Jesuits to abandon Florida for Mexico. The first mission of the Jesuits in California was established by Father Eusebius Kuhn or Kino, in 1683; gradually they founded 16 missionary stations, each of which was generally directed by one missionary. They administered these missions until the suppression of the order in Spain and the Spanish possessions. In 1611 the Jesuits established their first mission in the French possessions in America. This mission was interrupted for a time by the English, who in 1629 took Quebec and carried off the missionaries; but their work was resumed in 1638, and for nearly half a century they wrestled with paganism in the northern wilds. Quebec remained their centre, whence Jesuit missionaries were sent far and wide. The most distant effort made by the Jesuits was a mission in Arkansas. When Louisiana was settled, Jesuits were sent from France to undertake missions on the lower Mississippi, but these missions were not subject to the superior at Quebec, but to another at New Orleans. After the restoration of the order, the Jesuits recommenced their missions among the Indians on the Missouri in 1824, which gradually extended over a number of tribes. In 1840 the mission in Oregon was commenced by Father de Smet, one of the most celebrated missionaries of the order in the present century. Other missions were established among the tribes near the Amazon river in Brazil (1549), Peru (1567), the Antilles (1700), Mexico (1572), Congo and Angola, on the W. coast of Africa (1560), and Turkey (1627), where they effected in particular the submission of many members of the eastern churches to the authority of the pope.—Toward the middle of the 18th century the prime ministers of Portugal (Pombal), Spain (Aranda), and France (Choiseul) resolved nearly at the same time upon the expulsion of the Jesuits from their countries. Pombal was incensed against them, ostensibly because he suspected them of having instigated the Indians in Paraguay to resist the execution of the treaty of cession above mentioned. Soon after an attempt was made to assassinate Joseph I., and several Jesuits, particularly Father Malagrida, were accused of having been privy to the plot. Pombal requested the pope to take measures against the Jesuits; but when Clement XIII. hesitated, a royal edict of Sept. 3, 1759, declared the Jesuits to be traitors, suppressed the order in Portugal, Brazil, and the other Portuguese

colonies, and confiscated its property. All the Jesuits living in Portugal were transported to the Papal States. In France they fell into disfavor at court, when the two fathers who were the confessors of Louis XV. and Mme. de Pompadour refused to admit them to the sacraments, unless the latter was dismissed from court. Mme. de Pompadour and Choiseul united their influence with that of the parliament to suppress the order. At the same time its reputation among the people suffered greatly in consequence of the unfortunate commercial operations of Lavalette, superior of an establishment of the order in Martinique. Lavalette speculated largely in colonial produce, and, when two of his ships were taken by the English, became a bankrupt. A firm in Marseilles brought a suit for indemnification against the whole order, and the inferior courts as well as the parliament of Paris, to which the Jesuits appealed, gave sentence against them, and made them pay 2,000,000 livres to the plaintiff and the costs. Louis XV., who wished to save the society, at first yielded to the urgent calls for its suppression only so far as to demand in Rome that the society be reformed, and that the French Jesuits be placed under a vicar of their own. To this demand the general, Ricci, is reported to have given the famous response: *Sint ut vult, aut non sint*; whereupon the king expelled them from France in 1764. Their expulsion from Spain was effected in 1767 by Aranda, on the charge that treasonable writings had been discovered in one of the colleges, which declared the king a bastard and not entitled to the throne. On April 2 all the Jesuits of Spain and the Spanish colonies were arrested at the same hour, and shipped to the territory of the pope, who, at the request of the general of the order, refused to receive them. At the same time, and in a similar way, the order was suppressed in Naples, Parma, and Malta. On Dec. 10, 1768, all the Bourbon courts (France, Spain, Naples, and Parma) demanded from the pope its entire suppression for the whole church. Shortly after the pope died (1769), and the Bourbon courts succeeded in procuring the election of Clement XIV. (Ganganelli), who had given to the minister of Spain a written declaration that a pope, without acting against the canonical laws, was at liberty to suppress the order. For 4 years Clement XIV. endeavored to put off an event from which he feared the worst consequences for himself; but at length, when also the court of Vienna consented to the suppression of the Jesuits, he issued, July 21, 1773, the famous brief: *Dominus ac Redemptor noster*, by which the suppression of the society of Jesus in all the states of Christendom was declared. The brief was quickly complied with, yet the archives and treasures found in searching their houses did not equal in importance and amount the public anticipation. The ex-Jesuits had the choice either to enter other religious orders or to place themselves under the jurisdiction of the bishops. Everywhere, except in Portugal,

they received an annuity from the proceeds of their confiscated property. In Prussia, although they had to abandon the constitution of the order (1776), the favor of Frederic II., who esteemed them as teachers, permitted them to continue as an organized society, under the name of priests of the royal school institute. But this institute also was abolished by Frederic William II. In Russia, which, with the eastern part of Poland, had received in 1772 several houses of Jesuits, they enjoyed the patronage of the empress Catharine, who appointed an ex-Jesuit coadjutor of the archbishop of Mohilev, and sent him in 1788 as her minister to Rome. Pope Pius VI. in 1786, at his request, granted to the Jesuits of Russia the privilege of electing a vicar-general. The number of Jesuits in Russia amounted at that time to 178, and the total number of ex-Jesuits was estimated at about 2,000. Attempts to restore the order under other names were made in 1794, when the ex-Jesuits De Broglie and De Tournely founded the "Society of the Sacred Heart," and in 1798, when Paccanari founded the "Society of the Faith of Jesus." Neither met with much success. Better prospects for the ecclesiastical restoration of the order seemed to open with the beginning of the pontificate of Pius VII. (1801), who in 1804 confirmed its introduction into the kingdom of the Two Sicilies. On Aug. 7, 1814, Pius issued the bull *Sollicitudo omnium*, by which he restored the order with all the privileges it possessed at the time of its suppression. The vicar-general of Russia, Brzozowski, became thus the first general of the restored order; his successor, Fortis, elected in 1820, again took up his residence in Rome. They opened a novitiate at Rome on Nov. 11, 1814, and received in 1824 the direction of the *collegium Romanum*, and in 1836 that of the propaganda. In Modena, Sardinia, and Naples they were restored in 1815, and reinstated in the possession of a part or the whole of the former property of the order, and several new houses were established. They returned to Lombardy in 1837, to Parma and Venice in 1844, and to Tuscany (for a short time) in 1846. The revolution of 1848 endangered their existence in all Italy; mobs attacked their houses in Genoa and Naples, and they were expelled from nearly every state, even from the dominions of the pope. The general found for some time a refuge in England. They returned after the success of the counter revolution in 1849 to most states, except Sardinia and Tuscany, but were again expelled by the revolution of 1859 from Lombardy, Parma, Modena, and the legations. In Naples the principal organ of the Jesuits, the *Civiltà Cattolica* of Rome, was prohibited in 1855 for having censured the government, but in 1858 they received from the latter new marks of confidence. In Portugal, John VI. protested against their restoration; Dom Miguel admitted them by a decree of 1829, but Dom Pedro exiled them in 1834, since which time they have not returned to Portugal. In Spain, Ferdinand VII. in 1815

put them in possession of all their former rights and property. They were banished again during the revolution of 1820, but restored with Ferdinand in 1828. During the civil war, Queen Christina was compelled to suppress the order in Spain in 1835, and in 1840 its last house, at Loyola in Guipuzcoa, was dissolved by order of the provincial regency; but in 1844 they succeeded in establishing themselves again in the Spanish dominions. In France, during the reigns of Louis XVIII. and Charles X., they obtained only toleration, and 8 of their colleges, with about 3,500 pupils, were closed in 1828 by order of the government. The revolution of July, 1830, banished them again "for ever" from France, notwithstanding which they were able to maintain themselves, although in 1845 the chamber of deputies, with only a few dissenting votes, requested the government to have their houses closed. Since the accession of Napoleon III. the number of the members and establishments of the society has considerably increased. The Catholic almanac (*La France ecclésiastique*) for 1859 mentions 61 establishments in 88 dioceses. In the Netherlands, King William I. permitted them to form establishments, and after the separation of Belgium from Holland they increased largely in the former. The government of Austria admitted them into Galicia, which in 1820 was made a separate province of the order. The revolution of 1848 endangered their existence in Austria for a short time, but since 1849 their establishments have been more numerous and prosperous than before. The government transferred to them the direction of 7 of the state colleges, called a Jesuit from Rome to the university of Vienna, and in 1857 gave all the theological chairs of the university of Innsbruck to the order. The conversion of the duke of Anhalt-Köthen to the Roman Catholic church (1825) was followed by the establishment of a mission of the Jesuits at Köthen, which existed until 1848. In the kingdom of Saxony they were expressly excluded from the country by a provision in the constitution of 1831. The events of 1848, which expelled them from so many countries, opened to them a wide field of action in many of the German states, where they were permitted, for the first time since their restoration, to hold missions for 8 or more days. Many of the larger Protestant cities, as Berlin, heard on this occasion the preaching of the Jesuits for the first time. They were allowed to settle in Prussia, and in Westphalia and the provinces of the Rhine they founded within a short time a considerable number of establishments. In 1858 they had, according to the "Illustrated Catholic Almanac" for 1859, 14 establishments with about 700 members. They were recalled to Switzerland as early as 1814 by the government of Valais, which also put them in possession of the former property of the order. In 1818 they founded a college at Freyburg, which soon became one of the most famous institutions of the order, and had numerous pupils (676 in

1845) from nearly every country of Europe. The decision of the grand council of Lucerne, in 1844, to call Jesuits to the chairs of the theological school and to one of the parish churches of the capital, greatly increased the excitement already existing against them in most of the Protestant cantons. Several incursions were made from other cantons to overthrow the local government in order to expel the Jesuits. They were however unsuccessful, and strengthened the separate alliance (*Sonderbund*) which the government of Lucerne had formed with 6 other cantons for the protection of what they considered their sovereign cantonal rights. In 1847 the federal diet demanded the dissolution of the Sonderbund and the removal of the Jesuits; the 7 cantons refused submission to this decree, but the war of the Sonderbund ended in breaking up the alliance and in the expulsion of the Jesuits, who have ever since been forbidden by the federal constitution to return. In England, a rich Catholic, Thomas Weld of Lulworth castle, in 1799 gave to ex-members of the order Stonyhurst, which is still their largest establishment in that country. They conduct at present 8 of the 10 English Catholic colleges (Stonyhurst, near Whalley, Lancashire; Mount St. Mary's, near Chesterfield; and St. Benno's, at St. Asaph), and have several other houses. They have no establishment in Scotland, but in Ireland they have received since 1825 several houses and schools. In Russia, where their college of Polotzk received in 1812 the rank of a university, they lost the favor of the emperor when several young noblemen, who had been their pupils, were received by them into the Roman Catholic church. An imperial ukase of Jan. 1, 1816, closed their establishments at St. Petersburg and Moscow; and another of March 25, 1820, suppressed the order entirely in all Russia and Poland. The United States and the British possessions in America are among the countries where the order grows most rapidly. They are divided into the province of Maryland, having establishments in the dioceses of Baltimore, Philadelphia, Portland, and Boston; the vice-province of Missouri, having houses in the dioceses of St. Louis, Louisville, Cincinnati, Chicago, and Milwaukee; the mission of Canada and New York, having houses in the dioceses of New York, Albany, Buffalo, Quebec, Montreal, London, C. W., and Hamilton; the mission of Louisiana, with houses in the dioceses of New Orleans and Mobile; and the mission of California. Their colleges in the United States are as follows: college of the Holy Cross, Worcester, Mass.; of St. Francis Xavier, New York; St. John's, Fordham, N. Y.; St. Joseph's, Philadelphia; St. John's, Frederick, Md.; Loyola, Baltimore; Gonzaga, Washington, D. C.; Georgetown, D. C.; Spring Hill, near Mobile, Ala.; St. Louis university, St. Louis, Mo.; college of the Immaculate Conception, New Orleans; St. Charles's, Grand Coteau, La.; St. Joseph's, Bardstown, Ky.; St. Xavier's, Cincinnati; Santa Clara, Cal.; in Canada, St.

Mary's college, diocese of Montreal. The number of Jesuits in the United States at the present time (1860) is 650. In Mexico and the states of Central and South America they have sometimes been admitted, sometimes again expelled, their fate being often dependent on the success or defeat of the several political parties. Jesuits also now labor as missionaries in nearly all the non-Christian countries of the world, especially among the Indians of North America, in Turkey, in India, and China.—The order has had since the foundation the following 22 generals, many of whom belong also to its most celebrated names: 1, Loyola, a Spaniard, 1541-'56; 2, Laynez, a Spaniard, 1558-'65; 3, Borgia, a Spaniard, 1565-'72; 4, Mercurian, a Belgian, 1573-'80; 5, Acquaviva, a Neapolitan, 1581-1615; 6, Vitelleschi, a Roman, 1615-'45; 7, Caraffa, a Neapolitan, 1646-'9; 8, Piccolomini, a Florentine, 1649-'51; 9, Gottofredi, a Roman, Jan. 21 to March 12, 1652; 10, Nickel, a German, 1652-'64; 11, Oliva, a Genoese; 1664-'81; 12, De Noyelle, a Belgian, 1682-'8; 13, Gonzalez, a Spaniard, 1687-1705; 14, Tamburini, a Modenese, 1706-'30; 15, Retz, a Bohemian, 1730-'50; 16, Visconti, a Milanese, 1751-'5; 17, Centurioni, a Genoese, 1755-'7; 18, Ricci, a Florentine, 1758-'78, died in 1775; 19, Brzozowski, a Pole, 1814-'20; 20, Fortis, a Veronese, 1820-'29; 21, Roothaan, a Hollander, 1829-'53; 22, Beckx, a Belgian. Among the Jesuits who have been canonized or beatified, the most celebrated are Ignatius Loyola, Francis Xavier, Francis Borgia, Francis Regis, Aloysius Gonzaga, and Stanislas Kostka.—Before the suppression of the order, the Jesuits counted among their members some of the greatest scholars of Europe. The works of Petavius, Sirmond, Tursellini, and Viger in classical literature, and of Tiraboschi in literary history, are still valued and used. Among the theologians and pulpit orators, Bellarmine, Pallavicini, and Bourdaloue are especially distinguished. Since the restoration, Passaglia (who, however, left the order in 1858) and Perrone have gained the reputation of being among the principal theological writers of the Roman Catholic church, and Ravignan and Félix in France and Roh in Germany have been counted among the greatest Catholic pulpit orators. The most extensive literary work undertaken by the order is the *Acta Sanctorum* (Bollandist), commenced in the 17th century and still continued. The order publishes at present 3 periodicals: the *Civiltà Cattolica*, a semi-monthly magazine, at Rome (which has the largest circulation of any theological publication of Italy); the *Précis historiques et littéraires*, a semi-monthly, at Brussels; and the *Études théologiques*, a quarterly, at Paris. Several charges of complicity in the murder of princes have been brought against the Jesuits, some of which have been abandoned by all impartial historians, while none have been proved. These charges are closely connected with the doctrine of the rightfulness of tyrannicide, which has been defended by several writers of the order. It is gen-

erally admitted that 14 Jesuits, viz., Sa, Tolet, Valentia, Delrio, Salas, Mariana, Heissius, Suarez, Lessius, Becan, Gretser, Tanner, Castro-Paolo, and Escobar, have maintained it. But on the other hand, it is alleged that this doctrine was one very common among the Roman Catholic theologians, and that even Thomas Aquinas taught it; that more than 60 Jesuits have written against it; and that those Jesuits who admit it, confine it to a few exceptional cases, and allow it to be committed not by an individual, but only by a nation. Acquaviva, general of the society, by a decree dated July 6, 1610, forbade any member publicly or privately to uphold the doctrine that it is lawful for any one under any pretext of tyranny to attempt the life of any ruler. On other points of ethics members of the order have been accused even by certain Catholic writers of unsound principles, and some of the writings of Jesuits have been on this account censured by Rome. Concerning this point the defence presents the same arguments as on the preceding, viz., that none of the censured doctrines were peculiar to or shared by the whole order. A passage in the constitution of the order: *Vivum est nobis in Domino, excepto expresse solo quo societas summo pontifici pro tempore existenti tenetur, ac tribus aliis essentialibus paupertatis, castitatis, et obedientie, nullas constitutiones, declarationes, vel ordinem ulum vivendi posse obligationem ad peccatum mortale vel veniale inducere, nisi superior ea in nomine Domini nostri Jesu Christi, vel in virtute obedientie juberet*, has often been and is still construed by some writers as if it gave to the superiors of the order the right of obliging their inferiors to commit a sin. But the Jesuits have proved this to be a mistranslation of the Latin and in conflict with others of their rules; the true sense of the passage being, that none of the rules of the order so bind the members that the non-observance by itself involves a sin, but that a sin is committed only when a member violates a special order of the superior. Several Protestant historians of note, as Ranke ("History of the Popes") and Reuchlin ("History of Port Royal"), who in the first editions of their works had followed the former interpretation, have changed their view in subsequent editions, and pronounced the interpretation which the order itself gives of it the true one.—Among the most important works on the history of the Jesuits are: *Historia Societatis Jesu*, from 1540 to 1625, by Orlandini, Sacchini, Passinus, and other members of the society; Wolf (adverse to the Jesuits), *Allgemeine Geschichte der Jesuiten* (4 vols., Leipzig, 1808), valuable for its complete bibliography; Crétineau-Joli, *Histoire religieuse, politique et littéraire de la compagnie de Jésus* (6 vols., Paris, 1844-'6); Gioberti (a Catholic priest adverse to the Jesuits), *Il Gesuita moderno* (5 vols., Lausanne, 1847); A. Steinmetz, "History of the Jesuits" (8 vols., London, 1848); Abbé Guettée (Gallican, adverse to the order), *Histoire des Jésuites* (2 vols., Paris, 1858-'9). See also the "Institute of the Society of

Jesus, approved by the Holy See," "Decrees of the General Congregations," and "Ordinances of the Superiors General," all which have been published; "Life and Institute of St. Ignatius Loyola," by Bartoli; *Documents authentiques*, &c., by Carié de la Charie (Paris, 1827); and Ravnigan's *L'existence et l'institut des Jésuites* (Paris, 1844), and *Clément XIII. et Clément XIV.* (2 vols. 8vo., 1854).

**JESUITS' BARK.** See CINCHONA.

**JESUS CHRIST** (Ἰησοῦς, the Greek form of the Hebrew Jeshua or Joshua, salvation; Χριστός, the Greek translation of the Hebrew Messiah, the anointed), the founder of the Christian religion, born in Bethlehem, a city of Judæa, in the 4th year, as is supposed, before the Christian era, crucified on Calvary, near Jerusalem, probably in the 34th year of his age. The 25th of December has been received and commemorated by the church in the festival of Christmas from the 4th century as the day of his birth, though this date was previously unsettled, and the opinions of the learned have always varied concerning it. His genealogy is traced through David from Abraham by St. Matthew, and from Adam by St. Luke; the two pedigrees are after David entirely different, and the discrepancies have been variously explained by commentators. His mother Mary was the betrothed of a carpenter named Joseph; an angel announced to her: "The Holy Ghost shall come upon thee, and the power of the Highest shall overshadow thee;" she was found with child of the Holy Ghost, and her husband knew her not till she had brought forth her first-born son, who was named Jesus. Joseph and Mary resided in Nazareth, an obscure little town, whence they went up to Bethlehem to be taxed. It was there that the days were accomplished that she should be delivered, and the child was born in a manger, the inn being full. His birth and Messianic dignity were revealed by angels to shepherds tending their flocks by night in the field, and they went in haste to Bethlehem to greet the babe. After 8 days he was circumcised; after 33 days he was presented in the temple at Jerusalem, when the aged Simeon took him in his arms, and blessed God that he had lived to see the Saviour; and soon after his birth, while his parents yet remained in Bethlehem, three wise men (according to the ecclesiastical tradition, three kings) came from the East, guided by a star, and fell down before the young child, and worshipped him, and gave unto him gold, and frankincense, and myrrh. Their inquiries in Jerusalem had excited the suspicion of King Herod, who commanded them to bring him word if they found the child. But the parents of Jesus, warned in a dream, fled with him to Egypt (where, according to the legends, they dwelt in Hermopolis, and in the house of a priest named Aphrodisius). Meantime Herod, to whom the wise men had not returned, and who feared the loss of his throne if the Messiah were acknowledged, in order to make his destruction certain, gave

orders that all the male children in and near Bethlehem under two years of age should be put to death. After the death of Herod, Jesus returned with his parents to Nazareth. Of his early youth nothing more is known, except the summary statement of Luke that he waxed strong in spirit, filled with wisdom. When he was 12 years old his parents took him with them to Jerusalem to the feast of the passover. As they returned, he tarried behind without their knowledge; they retraced their steps in search of him, and after three days found him in the temple at Jerusalem, sitting in the midst of the doctors, hearing them and asking them questions, and astonishing them by his understanding and his answers. He returned to Nazareth with his parents, and was subject to them. Of the following 18 years, till the commencement of his public ministry, the canonical Gospels give no account. Various suppositions have been made to fill this gap in the narrative, as that he associated with learned Jews, and studied the Greek authors; that in his 14th year he went with John the Baptist to Egypt, and was instructed for 16 years by Egyptian philosophers; that he was educated in the school of the Essenes (which is the oldest opinion); that he was a Nazarite; and that he belonged to the sect of the Sadducees. None of these hypotheses, however, has been generally received. It is more probable that he followed the occupation of a carpenter, and, as the eldest son of the family, provided for its maintenance after Joseph's death. The apocryphal Gospels give full narratives of this period, concerning which the four evangelists are silent. His appearance as a public teacher was heralded by John the Baptist, who warned and admonished the people, exhorting them to repentance, baptizing them in the Jordan, and announcing the approach of one mightier than himself, who should baptize with the Holy Ghost and with fire. It was in his 31st year that Jesus came to the Jordan at Bethabara unto John, was recognized by him as the Messiah, and was baptized by him at his own command; and as he went up from the water a voice from heaven said: "This is my beloved Son, in whom I am well pleased." The events of his ministry, which is usually believed to have occupied about 3 years, are related by the evangelists, and have been arranged in chronological order (not in all cases with certainty) in harmonies of the Gospels. The public consecration by baptism was followed by the temptation and fast for 40 days in the wilderness. He then selected the first of his 12 disciples, afterward called apostles, and began to promulgate his doctrines, and to perform miracles. At a marriage in Cana of Galilee he changed water into wine to supply the guests. He attended a feast of the passover at Jerusalem, and by his mighty works made many believe in his name. Passing from Judæa to Galilee by way of Samaria, he revealed himself to a Samaritan woman at Jacob's well in Sychar. Again in Cana, he

cured by a word the son of a nobleman of Capernaum; in Nazareth, he healed a demoniac and other sick persons; on the sea of Galilee he lulled a tempest, and on the shores of the sea he performed many wonderful cures; and, as the number of those seeking help from him increased, he gave to his 12 disciples the power to heal diseases, and sent them forth to preach the gospel. It was probably on another journey through Galilee that he delivered before a numerous concourse the sermon on the mount, in which he set forth the spirit of his doctrine, the conditions of participation in the kingdom of God, and gave in the Lord's prayer an example opposed to the long prayers of the Pharisees. He afterward healed the palsied son of a centurion of Capernaum, and restored a widow's son at Nain to life. While performing such deeds as exemplifications and certificates of his doctrines, the second feast of the passover came. He attended it, and gave occasion for the hostility of the Pharisees by healing on the sabbath day at the pool of Bethesda a man who had suffered from an infirmity for 38 years. Leaving Jerusalem, a great crowd gathered about him on his way, and he miraculously fed 5,000 persons with five loaves and two small fishes. His numerous miraculous cures, and the increasing number of believers in him as the Messiah, deepened the enmity of the Pharisees, who sought to do violence to him. He therefore left Judæa, and passed along the coasts of Tyre and Sidon, repeating his miracles. The transfiguration, the foreshadowing of his own sufferings, and the choice of 70 disciples, whom he sent two by two into all the places which he intended to visit, preceded his journey to Jerusalem to the third passover. It was during this festival that he scourged the money changers from the temple. He departed thence to Perea; at Bethany he raised from the dead Lazarus, the brother of Martha and Mary; on his way toward the capital he cured at Jericho blind Bartimeus, and cursed the barren fig tree at Bethphage; made his entry into Jerusalem, riding on an ass, and was received in triumph by the people, whom he instructed concerning his passion, death, and resurrection. He returned to Bethany, declared the legitimacy of tribute to the Romans, foretold the fate of Jerusalem, and amid the hostile efforts of the Pharisees proclaimed his authority as the Messiah. Again entering Jerusalem, he celebrated the passover with his disciples, and at the feast he washed their feet, as a lesson of love and humility. He announced that on that night one of them should betray him, and designated Judas Iscariot as the traitor; instituted the Lord's supper; and with exceeding sorrow prayed in the garden of Gethsemane. Thither Judas came, at the head of an armed band, and betrayed to them the object of their search by saying: "Hail, master!" and kissing him. While his disciples fled, Jesus freely surrendered himself. He was brought before the court of the sanhedrim; and as he did not deny that he was the

Christ, the Son of God, he was adjudged guilty of blasphemy, and condemned to death. He was brought thence, on the charge of sedition, before the tribunal of Pontius Pilate, the Roman procurator of the province, who was induced by the clamor of the people to condemn him contrary to his own judgment. A scarlet robe and a crown of thorns were put on him in mockery, and he was led away to be crucified. At Golgotha or Calvary, vinegar mingled with gall was offered him to drink. He was crucified between two thieves, on a cross bearing the inscription in Hebrew, Greek, and Latin: "Jesus of Nazareth, the King of the Jews." He committed his mother to his beloved disciple John, according to which evangelist his last words were: "It is finished." At his death the sun was darkened, the earth did quake, and the veil of the temple was rent in twain from the top to the bottom. In the evening came Joseph of Arimathea, a disciple of Christ, and begged the body and buried it. After three days occurred the resurrection of Jesus; he appeared to his 11 remaining disciples, and to many others; remained with them 40 days, instructing and blessing them; and then visibly ascended to heaven. His last charge to his disciples was to go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost.—Beside the Gospels of Matthew, Mark, Luke, and John, and the commentaries on them, the following are among the more important works on the biography of Christ: Fleetwood, "Life of Christ" (London), and lives of Jesus by Neander (1817; 4th ed. 1845), Paulus (1828), Hase (1829; 8d ed. 1840), Ammon (1842-'5), Lange (1844), Hofmann (1852), and De Ligny. (See CHRISTIANITY.)

JET, a variety of lignite, resembling cannel coal, but harder, of deeper black, and of more brilliant lustre. It is found in detached pieces in tertiary clays along the coast of Yorkshire, England, and in various places on the continent of Europe. From its susceptibility of taking a fine polish and its intense blackness, it has been largely used for mourning articles of ornament, as buttons, crosses, ear rings, &c.

JETER, JEREMIAH B., D.D., an American Baptist clergyman, born in Bedford co., Va., July 18, 1802. He entered the ministry in his native county in 1822, and removed in 1827 to the "Northern Neck" of Virginia, where he was pastor of the Maratico church in Lancaster co., and of the Nicomico church in Northumberland co. In 1836 he became pastor of the first Baptist church in Richmond, Va., and in 1849 accepted an invitation from the second church in St. Louis, Mo. In 1852 he returned to Richmond to fill the pulpit of the Grace st. Baptist church. He is an earnest, clear, and logical preacher, and exerts a wide influence in his native state. Beside various minor treatises, sermons, and contributions to periodical literature, he has published a "Memoir of the Rev. Abner W. Olopton," the "Life of Mrs. Henrietta Shuck," a "Memoir of the Rev. Andrew Broadus," the

"Christian Mirror," and a controversial volume, entitled "Campbellism Examined" (1855).

JETSAM. See FLOTSAM.

JEW, THE WANDERING, according to the popular legend, born of the tribe of Naphtali, 7 or 8 years before the birth of our Saviour. The son of a carpenter or shoemaker, he early manifested his perversity by running away from his father to accompany the three wise men or kings who were guided by a star to the manger at Bethlehem. Returning to Jerusalem, his stories of what he had seen, and of the rich presents which the eastern monarchs conferred on the child, saluting him as king of the Jews, were the cause of the massacre of the innocents. He was employed as a carpenter on the cross destined for the passion of Christ, who passed his workshop on the way to Calvary, himself bearing the cross. The soldiers begged him to allow the Saviour to enter for a few moments' rest, but he not only refused, but offered insult. According to another legend, he was a shoemaker, sitting at his bench as the Saviour passed, and refused to permit him to sit for rest. Then Christ bade him to traverse the earth, without possibility of stopping or resting, until the second coming. In his ceaseless wanderings from that time he has in vain sought death amid all the greatest dangers and calamities to which human life is subject. The legend first appears in the chronicle of Matthew Paris in the 13th century, where the wandering Jew is called Cartaphilus, and said to have been a servant of Pilate. His name in the later forms of the legend is Ahasuerus. In the 16th and 17th centuries there were several impostors claiming to be the wandering Jew. The legend has furnished the subject of long poems by Schubart and Mosen; of a tragedy by Klingemann; of a mystico-philosophical drama by Edgard Quinet; of prose romances by the Rev. George Croly ("Salathiel"), Eugène Sue (who adds to it a wandering Jewess, Th. Oelckers, and David Hoffman of Baltimore ("Chronicles selected from the Originals of Cartaphilus the Wandering Jew," London, 1856); of the poem of the "Undying One," by Mrs. Norton; and of many short lyrical pieces.—See Doré, a volume of designs illustrating the legend, with a poem by Pierre Dupont (Paris, 1856), and Grasse, *Die Sage vom ewigen Juden* (Dresden, 1844).

JEWEL, or JEWELL, JOHN, an English bishop, born in Buden, Devonshire, May 24, 1522, died at Monkton Farleigh, Wiltshire, Sept. 22, 1571. He finished his education at Oxford, where for some years he acted as tutor. He early imbibed the principles of the reformation, and labored assiduously to disseminate them among his pupils; but he did not make a public profession of Protestantism till after the accession of Edward VI. His zeal in supporting the new faith led to his expulsion from Oxford in the reign of Mary. In 1554 he fled to the continent to escape imprisonment, and at the invitation of Peter Martyr went to Strasbourg, where he for some time assisted that learned man in conducting a

collegiate institution which he had established in his own house. On the death of Mary, Jewel returned to England, and was one of the 16 divines appointed by Elizabeth to hold a controversy at Westminster with a similar number of Catholics. In 1559 he was placed on the commission deputed by the government to extinguish Catholicism in the western dioceses of England, and on Jan. 21, 1560, was consecrated bishop of Salisbury. He was a voluminous controversial writer. The most famous of his works is his *Apologia Ecclesie Anglicanae* (1562), which was so esteemed by Elizabeth that she ordered a copy of it to be chained in every parish church of England and Wales.

JEWS. See HEBREWS.

JEWS-HARP, a small musical instrument, consisting of an iron frame, somewhat in the form of a lute, to the wide or circular part of which is fastened an elastic steel tongue, bent at the outer or free extremity to a right angle. The frame is placed between the teeth, and the sound is produced by the vibrations of the metal tongue when set in motion by the fingers. The action of the breath upon this tongue in different degrees of force produces a modulated air. The jews-harp was considered scarcely more than a child's toy, until the performances of Karl Eulenstein in the early part of the present century developed its resources. The limited scale which is peculiar to the instrument was obviated by employing a series of harps of different sizes. The name has been supposed to be a corruption of the French *jeu trompe*, and, with more probability, to be identical with jaws' harp, because it is held between the jaws when played upon.

JHANSI, a British province in the territory of Bundelcund, Hindostan, between lat. 24° 55' and 26° 48' N., long. 77° 58' and 79° 31' E.; area, about 2,580 sq. m.; pop. 200,000. It was annexed to the British possessions in 1854, on the death without lineal heirs of the rajah Baba Gunghadar Row.—JHANSI, the principal town in the above province, is situated on the route between Agra and Saugor, 142 m. S. from Agra, 180 m. N. from Saugor, and 740 m. N. W. from Calcutta. It is a walled town, surrounded by fine groves, and overlooked by a castellated palace of the former rajahs, built on the summit of a high rock and surmounted by a large round tower. The streets are remarkably clean and orderly. A considerable trade is carried on with the cities of the Deccan and the Doab, and there are manufactories of native weapons. On June 4, 1857, a mutiny of native troops took place here, and 67 Europeans, about half of whom were women and children, were massacred at the instigation of the ranees or chieftainesses of Jhansi. The ranees put herself at the head of the rebels, clad in mail, and during the rest of her career led her forces with masculine valor and ferocity. During Sir Hugh Rose's campaign in Bundelcund in 1858 a body of mutineers under her command shut themselves up in Jhansi, where they were besieged by Rose, March

25. After a relieving force under Tantia Topee had been defeated, the city was stormed on April 2, 8,000 rebels being killed. The ranees escaped to Calpee, was pursued, and retired thence to Gwalior, in the storming of which place, June 17, she was killed by a bullet. The natives burned her body to prevent it from falling into the hands of the British.

JIOARAL, a name applied throughout Spanish tropical America to tracts of ground covered with the *ficara* or calabash tree. This tree in size and shape resembles the apple tree of northern latitudes, and frequently covers large areas of ground to the exclusion of all other kinds of vegetation. Its fruit is covered with a woody rind, which, when cleared of its skin and pulp, is worked into shape for drinking vessels and similar purposes.

JIDDAH, DJIDDAH, or JEDDAH, a town of Hejaz in Arabia, on the Red sea, 65 m. W. from Mecca; pop. estimated at 20,000. It is well built on sloping ground and surrounded by a wall. The streets are clean for an eastern town, and the houses are generally constructed of stone or madrepora; but the suburbs which surround the walls are mere collections of wretched huts inhabited mostly by Bedouins. The principal buildings are the governor's residence, the custom house, a number of mosques of very little architectural pretension, some large and handsome khans, and a small castle mounting 9 or 10 guns. A rude stone structure beyond the walls is venerated by the Moslems as the tomb of Eve. Two parallel low walls over the exact place of sepulture are supposed to mark the outlines of the body of the *Sittna Hawwa*, the "mother of mankind," who by this rule must have measured 20 paces from head to waist and 80 from waist to heel. The surrounding country is arid and barren; water has to be collected in cisterns, and all necessities are brought from a distance. Jiddah, however, has a large trade, being the port of Mecca, and one of the principal commercial emporiums of Arabia. Corn, rice, butter, tobacco, oil, musk, civet, incense, spices, teak, cocoanuts, muslins, shawls, clothing, and slaves are the chief imports; and coral, dates, coffee, Mecca balm, Egyptian cottons, matchlocks, cutlery, hardware, leather, and mirrors are the most important exports. The trade is mainly with Egypt, Abyssinia, India, China, Mozambique, and the Malay archipelago. Many thousands of pilgrims arrive here annually on the way to Mecca, and during their stay the town presents a remarkable scene of bustle and confusion, as the crowd of visitors is swollen by the influx of great numbers of merchants from the surrounding country. Nearly all the inhabitants are foreigners; the families of a few officials connected with the law or religion are almost the only native residents. A number of British and French merchants have settled here, and each of those nations has a consul at the port. Jiddah was formerly governed by a pasha appointed directly by the grand seignior,

and afterward by the pasha of Egypt; since 1840 it has been under the protectorship of the grand seignior. On June 15, 1858, the Mohammedans committed an unprovoked massacre of 45 of the Christian inhabitants, among whom were the British consul and the French consul and his wife. The survivors, 28 in number, were saved by the governor of the place and by Capt. Pullen of her Majesty's ship *Cyclops*, which was then in port. The origin of the difficulty was a dispute with the British concerning the ownership of an Indian vessel. At the request of the outraged powers Namik Pasha with 800 men was sent from Mecca to preserve order; but no satisfactory reply having been given to a demand for the punishment of the murderers, the town was bombarded by the *Cyclops* for 8 days (July 25 and 26, and Aug. 5). On Aug. 6, 11 of the culprits were hanged, and others were sent to Constantinople. The Turkish government subsequently consented to grant pecuniary damages to the survivors of the massacre.

JIHOON, GIHOON, AMOO, or AMOO DARIA, the Oxus of the ancients, a large river of Independent Tartary. Its principal source is a mountain lake in the range of the Bolor Tagh. It flows for some distance S. W., and then turning N. W. continues its course in this direction to the sea of Aral, into which it discharges, after having traversed the territories of Badakshan, Bokhara, and Khiva, thrown off various branches, and received numerous affluents. Its entire course is about 1,100 miles. Its mouths form a number of islands. One of its branches formerly flowed into the Caspian sea.

JIQUILISCO, BAY or, sometimes called bay of Espiritu Santo, an arm of the Pacific, on the coast of San Salvador, Central America. Its entrance is in lat. 13° 8' N., long. 88° 36' W. It has a bar at its mouth carrying 10 feet of water at low, and 17 feet at high tide. Within this the water ranges from 4 to 8 fathoms. The bay is of irregular form, and sends out a number of *esteros* or creeks for long distances in the low grounds which surround it. This bay was made a port of entry in 1846, under the name of Puerto del Triunfo. It has every capacity for ordinary commercial purposes.

JIQUILITE, the aboriginal name of the native or indigenous indigo plant of Central America, the *indigofera disperma* of Linnæus. It differs widely in appearance from the exotic indigo plant of India, and produces indigo of a superior quality. It grows luxuriantly on all kinds of soil. The land is slightly broken up, and the seed is sown broadcast, in the months of February and April. By the 1st of August it attains the height of from 5 to 6 feet, and may then be cut. The product of the second year is however better than that of the first. The process of manufacture is simple and easy, and is carried on by the local proprietors individually. In Central America, the republic of San Salvador produces by far the largest quantity, averaging about 10,000 bales, valued at \$1,000,000, annually.

JO DAVIESS, a N. W. co. of Ill., bordering on Wis., and separated from Iowa by the Mississippi river; area, 650 sq. m.; pop. in 1855, 24,104. The surface is moderately uneven, and the soil is fertile and watered by numerous small streams. The county abounds in lead ore, and also contains copper. The agricultural productions in 1850 were 220,615 bushels of Indian corn, 207,288 of wheat, 250,386 of oats, 20,029 tons of hay, and 168,138 lbs. of butter. There were 15 grist mills, 7 saw mills, 2 newspaper offices, 14 churches, and 2,485 pupils attending public schools. The Mineral Point and Illinois central railroads pass through the county. Named in honor of Col. Joseph Hamilton Daviess, who fell at the battle of Tippecanoe. Capital, Galena.

JOAB, a Hebrew warrior, son of a sister of King David (1 Chron. ii. 16), and "captain of the host" (generalissimo of the army) during the greater part of David's reign, died in 1015 B. C. In the reign of Saul he accompanied David on his wanderings in the southern part of Palestine and its vicinity, and after the death of that king he defeated the troops of Abner, who opposed the succession of David, and whom he treacherously assassinated after he became reconciled to David. His valor in the assault on the fortress of Mt. Zion, held by the Jebusites, gained him the chief command of the army of all Israel, and he had the principal merit in the conquests of his master. He adhered faithfully to the king during the revolt of Absalom. When, in order to conciliate the powerful rebellious party, the command of the host was given to Amasa, who had been Absalom's general, Joab soon rid himself of this rival by murdering him. Shortly before the death of David he participated in the unsuccessful demonstration in favor of the natural heir Adonijah, and afterward fled for refuge to the altar, where he was put to death by command of the new king Solomon. His brothers Abishai and Asahel were also conspicuous as military leaders in the earlier part of the history of David.

JOAN, POPÉ, a fictitious personage of the female sex, who was for a long time supposed to have succeeded Leo IV. in the papal chair in 855, and to have occupied it over two years. The first who mentions her is Marianus Scotus, monk of the abbey of Fulda in the 11th century. According to Martinus Polonus, a Cistercian of the 13th century, Joan was a native of Mentz, who came with an English lover to Rome in the disguise of a man, and, having become proficient in sacred and profane learning, was chosen to the papacy, under the name of John VIII., no suspicion being had of her sex. She was seized with the pains of labor one day while passing in procession to the Lateran basilica, and died in the street. This story was interpolated into the work of Anastasius, who lived at the time of her supposed reign, and some critics contend that it is even wanting in the earlier copies of Martinus Polonus. It was completely disproved by Blondel in his *Fami-*

*lier éclaircissement de la question si une femme a été assise au siège papal entre Léon IV. et Benoît III.* (Amsterdam, 1649); and it is now generally admitted that no such person as Pope Joan ever existed, and that the immediate successor of Leo IV. was Benedict III.

JOAN OF ARC. See ARC, JOAN OF.

JOANNES, VICENTE. See JUANES.

JOANNES, or MARAJO, an island of Brazil, at the junction of the Amazon and Tocantins, forming part of the province of Para, about 120 m. long, and from 60 to 80 m. broad; pop. 20,000. The surface is almost on a level with the sea, and during the rainy season is nearly one vast marsh. Much of it is under forest, but the greater portion is *campo*, or open country, and is covered with coarse tall grass. Vast herds of cattle are reared upon this island, and myriads of wild ducks breed in the swamps.

JOB, BOOK OF, so called from the name of the patriarch whose history it contains, one of the canonical books of the Old Testament. According to the narrative contained in the introductory chapter, Job dwelt in the land of Uz, probably in the northern part of Arabia Deserta, was a man of eminent probity and piety, blessed with great riches in camels, sheep, and cattle, and highly reputed among the people on both sides of the Euphrates. But God permitted Satan to put his virtue to the test. His oxen were stolen by the Sabeans, his sheep were consumed by fire from heaven, his camels were carried away by the Chaldeans, and his sons and daughters perished amid the ruins of a house overthrown by a whirlwind. He bore these calamities without repining, saying: "The Lord gave, and the Lord hath taken away; blessed be the name of the Lord." Then Satan was permitted to afflict his person. He was smitten with a terrible disease; his wife urged him to "curse God and die;" and 3 friends, Eliphaz, Bildad, and Zophar, informed of his misfortunes, came in to console him. The book consists chiefly of discussions, in sublime but often obscure poetical diction, between Job and his consolers on the question: Why do the righteous suffer? The burden of their argument, which is afterward taken up with some variation by another friend, Elihu, is that calamities are in proportion to sins, and that Job must have been guilty of great transgressions, or he would not be made to suffer so severely. They therefore admonish him to confess and repent of the guilt of which by his misfortunes he stands convicted. Job maintains in opposition that his afflictions are greater than his faults, that upright men are sometimes extremely unfortunate, that God's justice does not always appear in the government of the world, and that he sometimes seems to act from mere will and pleasure as absolute Lord. At the conclusion the Lord himself addresses Job out of a whirlwind, condemning both his presumption in daring to criticize the Omnipotent, of whose ways he knows so little, and the insincerity of his friends, who endeavored to vindicate Provi-

dence by accusing an innocent sufferer. Job acknowledges his nothingness, and is amply rewarded for his constancy. Of the author of this book nothing is known, and its age is variously estimated. Formerly it was generally believed to be one of the most ancient books of the canon, and to have been originally written in old Hebrew or perhaps in Arabic. Some more recent expositors, as Gesenius, Umbreit, and De Wette, place it in the time of the Chaldean exile. Schlottmann refers it to the age of Solomon. Among the latest German commentaries are those of Hirzel (1838), Stickel (1842), Magnus (1851), Schlottmann (1851), and Studer (1858). There are English translations and commentaries by J. M. Good (1812), Fry (1827), Prof. G. R. Noyes, (Boston, 1838), and Prof. Conant (New York, 1857). A French translation with a historical introduction has been published by Renan (Paris, 1859).

JOCHMUS, ALBRECHT, a German soldier, born in Hamburg in 1808, took part in the Greek war of independence, and held high military positions under Gen. Church and afterward under King Otho. At the recommendation of the English ambassador in Athens, Sir Edmund Lyons, he joined in 1835 the Anglo-Spanish legion under Gen. De Lacy Evans; and, distinguishing himself on various occasions, he was eventually promoted by Espartero in June, 1837, to the rank of chief of the general staff of the army of the Asturias. Under the auspices of Lord Palmerston he afterward took an active part in the Egyptian war, and especially in the capture of St. Jean d'Acre, and was at the head of the united Turko-Anglo-Austrian army from Dec. 1840, until the close of the campaign, Feb. 16, 1841. He was afterward employed in the ministry of war in Constantinople until 1848, when he returned to Germany. In 1849, after the withdrawal of Gagern, he was appointed by the archduke John, vicar of Germany, minister of foreign affairs and of the navy. After the dissolution of the Frankfort parliament he again visited Constantinople. In 1854 he made a journey around the world, in the course of which he spent some time in the United States. In May, 1859, he received the commission of lieutenant field-marshal in the Austrian army, and was attached to the staff of the emperor.

JOEL, the 2d of the 12 Hebrew minor prophets, son of Pethuel, supposed by some critics to have prophesied in the reign of Uzziah, between about 800 and 780 B. C. The book of Joel begins with announcing an extraordinary plague of locusts accompanied by drought. This is followed by promises of the divine forgiveness, of the restoration of the land to its former fertility, of spiritual blessings, and of the divine vengeance on the enemies of the chosen people. His descriptions rank, in sublimity, vividness, and purity of style, among the finest passages of Hebrew poetry. Among the best commentators are Credner (1831), Meier (1841), and Hitzig, *Die zwölf kleinen Propheten* (2d ed. 1852).

VOL. X.—2

JOGUES, ISAAC, a French missionary among the North American Indians, born in Orleans, Jan. 10, 1607, killed at Caughnawaga, N. Y., Oct. 18, 1646. He became a Jesuit at Rouen in 1624, and, after some years passed in teaching and study, was ordained in 1636. At his own request he was immediately sent to Canada. He remained a short time at Miscoon, visited Quebec, preached to the Hurons, and in 1642, in company with Father Charles Raymbaut, crossed Lake Huron and founded a mission among the Chippewas in Michigan. In the summer of the same year he proceeded to Quebec to obtain supplies. On his return through New York he fell into the hands of a party of Mohawks, who cut off one of his thumbs, tore out his finger nails, and put him to other frightful tortures. He remained among them, partly as a slave, partly as a missionary, until the summer of 1643, when he made his escape to the Dutch settlement of Rensselaerswyck (Albany), and was conveyed thence to New Amsterdam. He was hospitably entertained here, and in November sailed for Europe, but was shipwrecked on the coast of England, and lost all he possessed. He finally reached France, where he was treated with great consideration, and invited to court. Returning to Canada, he travelled to the Mohawk country in May, 1646, in the capacity of an ambassador to conclude a treaty between that people and the French. Ascending the Sorel and passing through Lake Champlain, he reached Lake George, which he named Lake Saint Sacrement, and thence descended the Hudson to Fort Orange. Having ratified the peace at the Indian town of Onewyure, he returned to Quebec, and after a few days' rest set out for the Mohawks again, this time as a missionary. Immediately on his arrival he was seized as a sorcerer, the savages attributing to him a contagious fever which was then raging among them; and after slices of flesh had been cut from his arms and back, he was killed, and his body thrown into the river. His letters have been published in the collections of the New York historical society (II., iii.), and a description of the New Netherlands from his pen will be found in the "Documentary History of New York." He also left a memoir of René Goupil, one of his companions in the Huron mission, and a journal published by Alegambe in his *Mortes illustres* (Rome, 1667).

JOHANNA ISLAND. See ANZOON.

JOHANNES SECUNDUS, a Dutch poet, whose true name was JOHANNES EVERARD, born at the Hague in 1511, died in Utrecht in 1586. He gained while young the degree of LL.D., and had also some celebrity as a sculptor and painter. After travelling in Spain and Italy he accompanied Charles V. on his expedition to Tunis. His poems are written in purely classical Latin, and the *Basia*, or "Kisses" (Utrecht, 1539), have been ranked by his admirers with the lyrics of Catullus. They have been repeatedly translated into the principal European languages; and an edition, with translations by different

English scholars and with notes, was published by Bohn (London, 1858). His *Opera Poetica*, consisting of elegies, odes, epigrams, and other poems, were published by his brothers, the poets Nicolaas Gaudius and Andreas Marius (Paris, 1541).

JOHANNISBERG, a small village of Germany, in the duchy of Nassau, on the E. bank of the Rhine, 12 m. W. from Mentz; pop. 884. The vineyards in its vicinity are celebrated for producing the finest of the Rhenish wines, which derives its name from this hamlet. Near it is the chateau of Johannisberg, which in 1816 was given by the emperor of Austria to Prince Metternich. In 1848 it was declared national property, but afterward restored to the Metternich family, who, however, since 1851, have been bound to pay taxes to the duke of Nassau. The wine raised on the domain which belongs to the chateau is superior to that of the village of Johannisberg.

JOHANNOT, CHARLES HENRI ALFRED, a French artist, born in Offenbach, Hesse-Darmstadt, March 21, 1800, died in Paris, Dec. 7, 1887. He was taken to Paris when a child, and, having shown considerable talent as an engraver, in 1831 he attempted painting, and achieved a flattering success by his "Shipwreck of Don Juan" and "Cinq Mars." He attracted the notice of Louis Philippe, who gave him several commissions, and was rising into eminence as a painter of history when his death occurred. As a designer of vignettes he is well known by his illustrations for the French editions of Byron, Scott, and Cooper.—TONY, brother of the preceding, and an artist, born in Offenbach, Nov. 9, 1803, died in Paris, Aug. 4, 1852. He was a less successful painter than his brother, but in making designs for vignettes he displayed much facility and liveliness of invention. Among his most familiar illustrations are those for "Werther," Molière's works, "Gil Blas," the "Vicar of Wakefield," Sterne's "Sentimental Journey," "Jerome Paturot," and George Sand's romances.

JOHN, king of England, 8d sovereign of the house of Plantagenet, and 4th son of Henry II. and Eleanor of Aquitaine, born in Oxford, Dec. 24, 1166, died Oct. 19, 1216. The surname of Lackland (*sans-terre*), by which he is often mentioned, was popularly given him because of the small possessions that devolved upon him, while the elder sons were all liberally provided for; and it was "the usual appellation of younger sons, whose fathers died during their minority, and who could not possess estates until they were of age to do the feudal services required for them." When he was 7 years old his father bestowed property upon him in England and Normandy. A marriage between him and Alice, eldest daughter of the count of Savoy, was negotiated, but the lady's early death prevented its completion. Henry II. made John lord of Ireland by authority from Urban III., and he went with a large army to that country in March, 1185, accompanied

by his lord deputy, De Lacy, and Gerald Barry (Giraldus Cambrensis), the historian. His behavior was so imprudent, that he became the object of almost universal abhorrence, and his father was compelled to recall him to England at the close of the year. John was Henry's favorite son, but he joined in the repeated rebellions of his other sons; and Henry's death was occasioned by his becoming informed that John's name stood at the head of the list of those barons who had joined Philip Augustus of France against him, though at that very time he was exerting himself to benefit the fortunes of the rebellious prince. Richard I., successor of Henry, bestowed large possessions upon John, then known as earl of Mortmain, but that did not prevent him from behaving as unfraternally as he had behaved unfilially. Richard departed on his famous crusade, intending that, in case he should die childless, his successor should be Arthur, duke of Brittany, son of his brother Geoffrey, John's senior. When Richard on his return became a prisoner in Germany, John sought to render his imprisonment perpetual, and to seize the crown, raising forces, and doing homage to Philip Augustus for such portions of Normandy as he had not surrendered to him. He besieged places in England that were held by Richard's friends, asserted that his brother was dead, and demanded his own recognition as king. He did not succeed, and Richard returned to England in 1194, seized John's castle of Nottingham, and summoned him to take his trial for treason, he being then in France, whither Richard led an army. At the intercession of their mother, the king pardoned his brother, who remained faithful during the rest of Richard's life. Richard bequeathed to John all his dominions, and most of his treasure, and required that homage should be done him. John experienced little difficulty in obtaining possession of England and Normandy, and was crowned at Rouen, April 25, 1199, and at Westminster, May 27. His accession dates from April 6, but he was not regarded as king of England until he had been crowned. According to the rule of descent, the crown belonged to Arthur, duke of Brittany, and the mother of that prince, Constance, persuaded Philip Augustus to espouse his quarrel. Philip seized Anjou, Touraine, and Maine for Arthur, and he was advancing into Normandy, when John arrived there. After some negotiation, war was renewed; but the general of Arthur's forces, finding that the French king was acting for himself alone, effected a reconciliation between John and Arthur, which was of brief duration. The uncle sought to make away with his nephew, who fled back to Philip, accompanied by his mother. In 1200 a peace was made between John and Philip, the latter acknowledging John as Richard's heir, and forcing Arthur to do him homage for Brittany. John paid a large sum of money to Philip, the collection of which caused much trouble in England. The first demand for the privileges

of Magna Charta was made by the barons in May, 1201, and refused, whereupon they declined accompanying him to Paris, which he visited in order to be present at the marriage of his niece with the dauphin, and the king seized their castles. John, who had been compelled to put away his first wife, Avis, because they were related within the forbidden degrees, married Isabella, daughter of the count of Angoulême, Aug. 24, 1200. This lady had been betrothed to Hugh de Lusignan, son of the count of La Marche, who challenged John to combat. John offered to fight by his champion, an offer which Lusignan treated with contempt, declaring that the king's champions were braves. Arthur's claims having been renewed, and insurrections in his favor occurring in Anjou and Maine, Lusignan espoused his cause, and civil war broke out in Poitou and Normandy. Arthur and Lusignan besieged Eleanor of Aquitaine in the castle of Mirebeau, in Poitou, and John hastened to his mother's assistance. On Aug. 1, 1202, he defeated the besiegers in a pitched battle, killing or capturing them all. Arthur, who was but 16 years old, was among the captives. He was imprisoned, and is supposed to have been put to death by his uncle, a belief quite in keeping with John's actions, and in accordance with the spirit of the age. John was accused of the murder of Arthur by Philip Augustus, and was summoned to defend himself before the peers of France. Refusing to attend, the court pronounced judgment, that "whereas John, duke of Normandy, in violation of his oath to Philip his lord, had murdered the son of his elder brother, a homager of the crown of France, and had perpetrated the crime within the seignory of France, he was found guilty of felony and treason, and was therefore adjudged to forfeit all the lands which he held by homage." This decree of forfeiture was vigorously put in force by Philip, whose proceedings were aided by the discontent that prevailed in John's French possessions. In 1203 nearly all those possessions except Guienne were taken by Philip, and John fled to England. He had said, on hearing of Philip's captures of towns: "Let him take them, I will one day recover them; the English sterlings will restore all things." This would have been no idle boast had he been a popular monarch in England; but there he was even more detested than he was in France. The name of Lackland was now revived for him. He had received no aid from the English barons, whom he proceeded to fine frequently and heavily; and the archbishop of York cursed the collectors of the fines, and left England. Those quarrels now began which ended in the granting of the great charter. John became involved in a contest with the church concerning the election of Cardinal Langton to the see of Canterbury, and Pope Innocent III. laid England under an interdict. The king seized the possessions of the church, and banished those who had occupied them. A bull of excommunication was issued in 1209, and John

sought to prevent its promulgation in England, without which it could have no force. His fear was, that Philip of France would attempt the conquest of England, under papal authority, and he maintained relations with some of that prince's neighbors. According to Matthew Paris, he even sought an alliance with a Mohammedan ruler in Spain, who had been very successful in his wars with the Christians. John is reported to have offered the English crown to the Moor, and to turn Mussulman himself. Strange as this story may appear, it is by no means improbable. John was on his mother's side of a race which did not share in the common horror of Mohammedanism; and throughout his whole life his conduct was marked by actions so eccentric, that the plea of insanity has been put forward in his defence, as in the case of the Roman Cæsars. In the mean time, John compelled William, king of Scotland, to acknowledge his supremacy, and effected conquests in Wales, dictating terms of peace to Prince Llewellyn. He also led a great army to Ireland, where he curbed the Norman colonists, divided the English possessions into counties, and established there the laws of England. He was guilty of acts of cruelty that shocked the sentiment of even that ferocious age. Of the captives whom he took in 1202 most of the principal men were starved to death in prison. On an insurrection occurring in Wales, he caused 28 hostages, all young nobles, to be executed. The family of De Braiose having refused to obey some of those ordinances by which he sought to degrade the nobility, and the wife and mother having declared she would not surrender her children to a king who had murdered his own nephew, he caused the father and mother, and their 5 children, to be confined in a room in the old castle of Windsor, until they died of hunger. In 1213 the pope solemnly deposed John, and absolved his vassals from their allegiance. The French king prepared to enforce the sentence, and John assembled a numerous army to defend his kingdom; but as he could not rely upon its fidelity, he listened to the arguments of the nuncio, Pandulph, and resigned his kingdom to the pope, whose vassal he became. This act, so degrading to modern ideas, was not viewed so harshly then, and had many precedents; and the barons themselves acknowledged its validity. Pandulph proceeded to France, where he commanded Philip to put an end to his project of invasion, as England had become the patrimony of St. Peter. That monarch endeavored to turn his preparations to account by planning the conquest of Flanders, but he had ultimately to fight for his own dominions at Bovines. John invaded France, but accomplished nothing, though his fleet had previously defeated that of Philip. Continuing his course of misgovernment, a confederacy was formed against him by the nobility, at the head of which stood Archbishop Langton and the earl of Pembroke, and Robert Fitz-Walter commanded their forces. The king

was compelled to submit to the barons, who forced him to make the grant known as *Magna Charta* (see *MAGNA CHARTA*), June 15, 1215. His submission was but momentary; as soon as he could raise a foreign force, and aided by the pope, who regarded the barons as rebels against himself, he resumed the war with success. The barons applied to France for aid, offering to make the dauphin Louis king of England. Louis entered England at the head of an army. John was about to fight a battle for his crown, when he lost his baggage, treasure, &c., in "the Wash." This affected his mind, and as he was ill at the time of the loss, his sickness so increased that he soon after died. His death was attributed to poison, and also to dysentery, brought on by partaking freely of peaches and new cider. Modern England dates from the reign of John, whose cowardice and imbecility led to the loss of the greater part of the French possessions of his family, and so caused the Norman portion of the inhabitants of the island to regard the English as their countrymen. From the conquest to the beginning of the 18th century England had been ruled by French monarchs, men eminent in council and in the field, but the full success of whose plans would have reduced her to the condition of a province. From the moment she "fell under the dominion of a trifier and a coward," as Macaulay remarks, "her prospects brightened. John was driven from Normandy. The Norman nobles were compelled to make their election between the island and the continent. Shut up by the sea with the people whom they had hitherto oppressed and despised, they gradually came to regard England as their country, and the English as their countrymen. The two races, so long hostile, soon found that they had common interests and common enemies. Both were alike aggrieved by the tyranny of a bad king. Both were alike indignant at the favor shown by the court to the natives of Poitou and Aquitaine. The great-grandsons of those who had fought under William and the great-grandsons of those who had fought under Harold began to draw near to each other in friendship; and the first pledge of their reconciliation was the great charter, won by their united exertions, and framed for their common benefit."

JOHN II., surnamed *Le Bon* (the Good, or rather the Gallant), king of France, the 2d of the Valois family, born about 1319, died in London in 1364. Succeeding his father Philip VI. in 1350, he indulged in such extravagant expenditures to celebrate his accession to the throne that he soon found the royal treasury exhausted, and had to summon the states-general for a grant of money. His first measures were marked by despotism and cruelty. By his orders, the great constable Raoul, count of Eu and Guines, whom he suspected of treacherous dealings with the English, was arrested and beheaded without any form of trial, while his office and property were given to Charles of Lacerda, a Spanish prince. The latter having been mur-

dered at Laigle, Normandy, by Charles the Bad, king of Navarre, a friend of Raoul, King John came unexpectedly to Rouen, where Charles was entertained by the dauphin, made him a prisoner with his own hand, and caused 4 of his followers to be decapitated on the spot. Philip, brother of Charles of Navarre, and the count of Harcourt, uncle of one of the victims, appealed to Edward III. of England for vengeance. The English invaded France at once. King John met one of their armies, under the Black Prince, at Maupertuis, near Poitiers, and, elated by his superiority in numbers, attacked him imprudently, was defeated, Sept. 19, 1356, and carried prisoner first to Bordeaux, and then to London. During his captivity, violent dissensions broke out in France, and the dauphin, who had assumed the regency, was for a while unable to contend against the rising power of the third estate. At the end of 8 years, John tried to regain his freedom by a humiliating treaty with Edward III., which was rejected by the states-general of France. The disastrous peace of Bretigny (1360), however, provided for the liberation of the French king by the sacrifice to the English of some of the best French provinces and the payment of a ransom of 8,000,000 crowns. On his return home, John, coming by inheritance into possession of the duchy of Burgundy, bestowed it on his 4th son, Philip the Bold, as a reward for his gallantry at the battle of Poitiers. Another son, the duke of Anjou, whom he had given as a hostage for the fulfilment of the treaty of Bretigny, having forfeited his word by running away from England, John thought himself in honor bound to return to captivity, saying: "If good faith were banished from earth, it ought to be still found in the hearts of kings." He consequently returned to London, and there died.

JOHN II. CASIMIR, king of Poland, born March 21, 1609, died in Nevers, France, Dec. 16, 1672. He was a younger son of Sigismund III., of the house of Vasa, by an Austrian princess, who was baffled in her schemes to procure him the throne by his loyal adherence to his elder half brother Ladislas, who after the death of Sigismund was elected king (1632). John Casimir travelled through various countries of western Europe, entered the order of Jesuits in Rome, was made cardinal by Innocent X., but after his return to Poland again became a layman, and, having succeeded his brother in 1648, married his widow Maria Luisa Gonzaga. His reign commenced amid the confusion and disasters caused by the great revolt of the Cossacks under Chmielnicki, who had advanced into the very heart of Poland. The power of the king had been stripped of almost all its prerogatives by the growing influence of the nobles. Russia and Sweden, which had long been active enemies of Poland, availed themselves of its distracted condition, and renewed their attacks. George Rákóczy of Transylvania, too, invaded the Polish territory, while diet after diet was dissolved by abuses of the *liberum veto*. Charles

Gustavus of Sweden triumphantly marched through the country, and occupied Cracow, John Casimir having fled to Silesia. Before Czenstochowa, however, the Swedes met with an unexpected check, and a confederation of the nobles against all enemies of the country having been formed, Czarniecki won a series of victories over the Swedes, Transylvanians, Cossacks, and Russians. The wars with the Swedes and Russians were terminated by treaties involving considerable cessions of provinces on the Baltic and the Dnieper on the part of Poland, which also lost its sway over the Cossacks, who put themselves under the protection of the czar. During these long disturbances John Casimir, though feeble and of a peaceful disposition, frequently proved his patriotism and bravery. The intrigues of his wife in favor of the prince of Condé as successor to the throne having brought about a rebellion under George Lubomirski and a bloody though short civil war, the king finally resolved upon abdication, and resigned his crown at the diet of Warsaw, Sept. 16, 1668. In the following year he retired to France, where he was hospitably treated by Louis XIV. His wife had died without issue before his abdication. His body was removed to the cathedral of Cracow in 1676, his heart only being interred in St. Germain des Prés, of which Louis XIV. had made him abbot. John Casimir's reign was one of the most disastrous in the history of Poland, whose dismemberment by the houses of Moscow, Brandenburg, and Hapsburg, which was executed 100 years after his death, he predicted in a memorable speech to the diet of 1661.

JOHN III. SOBIESKI, king of Poland, born in the circle of Zloczow, then belonging to the palatinate of Belz, in 1629, or according to some in 1624, died June 17, 1696. His father, Jacob Sobieski, castellan of Cracow, who had fought with distinction under Zolkiewski and Chodkiewicz in the "war of Chocim," on which he wrote a commentary in Latin, carefully attended to the education of his two sons, of whom Marcus was the elder, and to complete it sent them to Paris. Here John entered the ranks of the musketeers of the young Louis XIV. under Condé, but on receiving the news of the death of King Ladislas IV. and the disasters caused by the bloody rising of the Cossacks (1648), both brothers hastened to their country and offered their services to the brother and successor of Ladislas, John Casimir. Both fought bravely, John especially distinguishing himself in the battle of Beresteczko (1651), but Marcus fell soon after. The invasion of Charles Gustavus of Sweden and the simultaneous dangers which threatened Poland from every quarter gave Sobieski ample opportunity to display his heroic valor, and next to Czarniecki he was foremost in saving the country from ruin. His services were well rewarded, and shortly before the abdication of John Casimir he received the chief command of the army. The new king, Michael Korybut, having concluded an ignominious

treaty with the sultan, Sobieski caused its rejection by the senate, hastened to Podolia, and routed the Turks at Obocim (1678). The news of the king's death arrived a few days later, and the commander and his followers hastened to Warsaw to attend to the election of a successor. This resulted, after stormy debates, in the choice of Sobieski, who immediately resumed the war, and rescued the fortress of Trembowla, which had been saved by the heroism of the wife of the commander. Another campaign was terminated less successfully by a treaty with the Turks at Zurawno, where Sobieski was nearly compelled to surrender with his comparatively small army. The rising of the Hungarians under Toköli, and the invasion of the Mussulmans under the grand vizier Kara Mustapha, having brought Austria to the brink of ruin, Sobieski was persuaded by his wife and the ambassadors of the emperor and pope to hasten to the rescue of Vienna, which was besieged by an army of 800,000 men (1683). The Poles, numbering about one tenth as many, were joined by a somewhat larger body of German troops. Scarcely had they arrived before Vienna when Sobieski gave the signal for attack. The Turks were driven within their intrenchments, and attacked there on the next day. The charge was terrible, and after a short struggle the Turks were completely routed. Sobieski made a triumphal entry into Vienna, and was hailed by all Europe as the saviour of Christendom. The emperor Leopold alone, who had fled from his capital, was too proud to receive cordially the hero who was "only an elected monarch." Sobieski pursued his success, following the enemy into Hungary, which was soon restored to the emperor. Returning to Poland, where the intrigues of his wife had created for him a large number of enemies, he made a disadvantageous peace with the czar, in order to be able to turn all his forces against the Turks. The conquest of Wallachia was the aim of this undertaking, in which he failed after various attempts. The last years of his life were embittered by civil as well as domestic troubles. Admired as a warrior and a man of rare accomplishments, he was little esteemed by the Polish nation as a monarch, and after his death his 3 sons, Jacob, Constantine, and Alexander, were passed over at the election, which gave the crown of Poland to Augustus of Saxony. The *Lettres du roi de Pologne, Jean Sobieski, à la reine Marie Casimire, pendant la campagne de Vienne*, were published in Paris in 1686.

JOHN (JOHANN NEPOMUCK MARIA JOSEPH), king of Saxony, son of the duke Maximilian and the princess of Parma, born Dec. 12, 1801. He distinguished himself at an early age by his knowledge of Italian literature, and prepared a metrical translation of the first 10 cantos of Dante's *Inferno*. Subsequently he published a version of the whole *Divina Commedia*, with critical and historical annotations (8 vols., Leipzig, 1839-'49). He presided for many years

over the financial affairs of Saxony, and took an active part in the preparation of the constitution of 1831. In the upper chamber, where as a prince of the blood royal he occupied the first place, he evinced much ability. He is particularly conspicuous for his devotion to the interests of the church of Rome. He succeeded his brother Frederic Augustus on the throne of Saxony, Aug. 9, 1854. His wife is a daughter of the late Maximilian of Bavaria. His eldest daughter was married to the duke of Genoa, a brother of the king of Sardinia, who died in 1855. His eldest son, Frederic Augustus Albert (born 1828), married in 1858 a daughter of Prince Gustavus Vasa.

JOHN, archduke of Austria and vicar of Germany, born in Florence, Jan. 20, 1782, died in Gratz, May 10, 1859. His father, Leopold II., grand duke of Tuscany, succeeded in 1790 his brother Joseph II. as emperor of Austria. His mother, a virtuous, pious princess, was a daughter of Charles III. of Spain; and his elder brother was Francis I., emperor of Austria. Without having had any opportunity of acquiring practical military knowledge, he was appointed in 1800 to take the command in chief of the Austrian army, and was defeated by the French under Moreau at Hohenlinden and near Salzburg. After the peace of Lunéville (Feb. 9, 1801) he became director-in-chief of the department of fortification and engineering, and of the chief military academies of the empire. He frequently visited the Tyrol, where he became very popular. He took the place of his brother, the archduke Charles, as president of the council of war and as minister of war, from 1808 to Sept. 1805, when he was invested with the command of the army in the Tyrol, but was not able to preserve that country for Austria. In 1809 he planned through Hormayr the rising of the Tyrolese, and commanded the army which was to operate in the Tyrol and Italy. While Chasteler, acting under his orders, succeeded in conquering the former country, the archduke achieved several victories in Italy, especially on April 18, near Sacile, over the viceroy Eugene. On hearing of the critical condition of Vienna, he effected his retreat; but while on his way to rescue the capital he was defeated on the Piave (May 8), and, having retreated as far as Hungary, met with a still more disastrous defeat at Raab (June 14, 1809). On July 5 he was summoned to the assistance of the archduke Charles at Wagram, but was not able to effect a junction with his army. He relinquished his command after the peace of Vienna, Oct. 14, 1809, and with the exception of the siege of Hünningen took no part in the campaigns of 1813-'15. He was not permitted to go to the Tyrol, his popularity there rendering him an object of suspicion to the court. He resided many years chiefly in Gratz, which city he had already benefited in 1811 by the foundation of the Johanneum gymnasium, and which is indebted to him for many other public institutions. In 1827, while travelling in Styria, he became acquainted with

Anna Plochel, whose father was postmaster at Aussee. He contracted a morganatic marriage with her, after which she was raised to the rank of baroness of Brandhof and countess of Meran. He lived for many years in retirement, devoted to scientific and industrial pursuits, but his popular personal qualities created for him a reputation beyond the mountains of the Tyrol and Styria; and in 1848, on the adoption of a provisional government by the Frankfort parliament, he was chosen vicar of the empire (*Reichsverweser*). Shortly before, after the downfall of Metternich and the subsequent flight of his nephew, the emperor Ferdinand, to Innspruck, he had been appointed by the latter to take the reins of government at Vienna. The archduke preferred, however, to devote himself to the management of affairs at Frankfort, but although showing much disposition to accept the responsibilities of a constitutional ruler, he was chiefly engaged in preventing a preponderance of Prussia at the expense of Austria. After the adoption of the resolution of March 28, 1849, which nominated the king of Prussia emperor of Germany, he was with difficulty prevented from abdicating; after the withdrawal of the Gagern administration (May 10, 1849), he appointed Grävell, Jochmus, Detmold, and Merck as his ministers, who were all, with the exception of Grävell, who soon retired, Austrian partisans, while the archduke himself virtually ceased to occupy any other position but that of a guardian of the interests of the Austrian dynasty. His term of office expired Dec. 20, 1849, after which he returned to Styria, leaving the reputation of a prince whose attachment to the house of Hapsburg was stronger than his sympathies with the welfare of the German people. He had one son, Francis, count of Meran.

JOHN, KNIGHTS OF SAINT. See SAINT JOHN, KNIGHTS OF.

JOHN OF GAUNT (OR GHEENT), duke of Lancaster, 4th son of Edward III., born in Ghent in 1340, died in 1399. He married Constance, one of the daughters of Pedro the Cruel of Castile, and immediately assumed the arms and title of king of Castile. He distinguished himself for valor in the wars of the Black Prince in France, and succeeded to the management of his affairs. In England he defended Wycliffe, and was often suspected of aiming at the crown. He resigned his pretensions to the throne of Castile, when in 1386 his daughter Catharine married the heir apparent of that kingdom. His eldest son in 1399 became the first English king of the house of Lancaster, as Henry IV. John of Gaunt's third wife was Catharine Swynford, governess of his children, by whom he had 3 sons and one daughter before their marriage. These were legitimated, and one of them, John de Beaufort, earl of Somerset, was an ancestor of the Tudors.

JOHN OF LEYDEN. See ANABAPTIST.

JOHN OF SALISBURY, called also JOHANNES PARVUS (John the Little), an English scholastic philosopher, born in the old town of Salisbury (Old Sarum) about 1180, died in Chartres,

France, Oct. 25, 1180. He studied at Oxford, and in 1186 passed over to France, where he attended with enthusiastic admiration the lectures of Abelard, whom he esteemed the most profound and brilliant of the doctors, and afterward of Alberic of Rheims, Robert of Melun, William of Soissons, Richard the Bishop, and Pierre Hélie. He opened a school at Paris about 1140, but with little success, and on account of his poverty retired to the abbey of Montier la Celle. About 1151 he returned to England with recommendations from Pierre de Celle and St. Bernard, and was appointed secretary to Theobald, archbishop of Canterbury, who introduced him to his future successor Thomas à Becket. He was sent on important diplomatic missions to Popes Eugenius III., Anastasius IV., and Adrian IV., with the last of whom he was an especial favorite. He was the secretary of Becket when he became archbishop of Canterbury, was called his eye and his arm, supported him in his contest with Henry II., shared his exile and disgrace, and returned with him to England. In 1176 he was elected to the bishopric of Chartres, and passed the rest of his life in his diocese. He was highly reputed not only as a scholar, but as a poet and orator. His most important works are: *Polycraticeus, sive de Curialium Nugis et Vestigiis Philosophorum*, an erudite and caustic satire on the follies of courtiers and philosophers, and *Metalogicus*, in which he vindicates the studies of the schools against the sneers and outcries of the ignorant. His complete works were first collected by J. A. Giles (5 vols., Oxford, 1848).

JOHN THE BAPTIST, the forerunner and relative of Christ, son of the priest Zacharias and Elizabeth, and cousin of the Virgin Mary, born at Jutta or at Hebron in 5 B. C., beheaded about the end of A. D. 28. His birth and office were foretold by the angel Gabriel to his father as he was burning incense in the temple of Jerusalem. When Zacharias asked for some sign of the truth of the prophecy, his tongue was sealed, and he did not recover his speech till after the birth of the child. Six months after Elizabeth had conceived, she was visited by Mary, and at her salutation she felt the babe leap in her womb. John abode in the desert until, a short time before the ministry of Jesus, he appeared clothed with camels' hair and with a leathern girdle about his loins as a prophet in the country about the Dead sea, exhorting the people to repentance, and proclaiming the approach of the Messiah. Those who believed he baptized in the Jordan, announcing at the same time the coming of a mightier one, who should baptize them with the Holy Ghost and with fire. He recognized the Messiah in Jesus, who presented himself for baptism, and publicly declared him "the Lamb of God, that taketh away the sins of the world." It is not certain what were the relations between John and Jesus, but the disciples of the former were a separate sect after his death, and still exist in the East under the name of Sabians or Christians of St. John. On ac-

count of his censure of the marriage of Herod Antipas with his sister-in-law Herodias, John was imprisoned in the castle of Machærus, where he was beheaded at the instance of Herodias. His birth and death are commemorated by the Roman Catholic church respectively on June 24 and Aug. 29. In England he was formerly esteemed the patron of architects, and was held in special honor by the free masons.—See Rohden, *Johannes der Täufer* (Lübeck, 1888).

JOHN THE EVANGELIST, one of the apostles, son of the fisherman Zebedee and Salome, born in Bethsaida, on the lake of Galilee, died about A. D. 100. He followed the occupation of his parents, was probably a disciple of John the Baptist, and became when about 25 years old, with his brother James, a disciple of Jesus, whom he was one of the first constantly to accompany. It is believed that he was the youngest of the apostles, and the special attachment of the Saviour to him is expressed in his description of himself as "that disciple whom Jesus loved." He was present at the transfiguration, prepared the last supper, at which he reclined on the bosom of his master, and was the only disciple who accompanied Jesus to the cross. While hanging on the cross the Saviour confided his mother to the care of St. John. After the ascension John remained for a while at Jerusalem, but from this time history is silent concerning him. The traditions, however, agree that he afterward abode in Ephesus and Asia Minor. According to Jerome, he was arrested by command of the proconsul, and taken to Rome, where he was plunged into a vessel of boiling oil, but, as this did not harm him, was banished (A. D. 95) to the island of Patmos; he was released after the death of Domitian, and died in the reign of Trajan, at a very advanced age. According to the same authority, he became at last so weak that he was obliged to be carried to the Christian assemblies, and when there could only say: "Love one another, my children." His festival is celebrated by the Roman Catholic church on Dec. 27. He is usually painted with a cup from which a serpent is issuing, in allusion to poison which was believed to have been offered him in a glass, from which he expelled the venom in the form of a serpent by making the sign of the cross.—The New Testament contains a Gospel, three Epistles, and the Apocalypse, or book of Revelations, bearing his name. His Gospel gives the speeches of Christ more fully than the synoptic Gospels, but historical facts appear less prominently in it than the doctrines which are implied and established by the facts. According to the fathers, it was written at Ephesus or at Patmos in the latter part of the 1st century, but the certain external proofs of its authenticity begin with the year 170; from that time it was received without question by the church. Bretschneider (1820) supposed it to have been written in the first half of the 2d century to develop a metaphysical doctrine of the divinity of Christ. Schwegler (1841), Baur (1847), and others, have viewed

it as skillfully composed in the 2d century for the purpose of reconciling the Jewish and gentile Christians. Its genuineness has been maintained among others by Calmborg, Hauff, Schleiermacher, Baumgarten-Crusius, Luthardt, Niermayr, and Schneider.—The 1st Epistle was probably addressed to Christian congregations in Asia Minor, which had been under the charge of the apostle, and urges love, devotion, and moral strictness. It consists of separate thoughts and precepts, with little logical connection. The 2d Epistle is addressed to a lady of rank, called "the elect lady," supposed by some to refer to a Christian church. The 3d Epistle is addressed to Gaius, who is commended for his hospitality to the faithful, and contains, like the 1st, allusions to Gnostic errors.—The Apocalypse has been treated in this work under its special head.—The most comprehensive commentary on the writings of John is that of Lücke (3d ed., under the care of Bertheau, 1856). Other important commentators on them, beside those on the New Testament collectively, are: on the Gospel only, Tholuck (1827) and Lange (1860); on the Epistles, Dinstedieck (1852); on the 1st, Epistle, Steinhöfer (1848), Neander (1851), and Erdmann (1854).

JOHN SCOTUS. See ERIGENA.

JOHNSON, the name of 8 counties in the United States. I. A N. co. of Texas, intersected by Brazos river; area, 998 sq. m.; pop. in 1858, 2,304, of whom 257 were slaves. The surface on the E. of the Brazos is undulating, and on the W. hilly. The soil is well adapted to wheat, and is generally fertile. Prairie and timber lands are distributed in nearly equal quantities. The county was organized in 1854. Value of land in 1858, \$190,980. Capital, Buchanan. II. A N. W. co. of Ark., traversed by Arkansas river, which is here navigable by steamboats; area, 840 sq. m.; pop. in 1854, 5,021, of whom 920 were slaves. The surface is moderately uneven, and the soil is fertile, but not uniformly so. The productions in 1854 were 246,505 bushels of Indian corn, 8,484 of wheat, 58,876 of oats, and 1,862 bales of cotton. Capital, Clarksville. III. A N. E. co. of Tenn., bordering on Va. and N. C., and having the Alleghany mountains on its S. E. boundary; area, 800 sq. m.; pop. in 1850, 8,705, of whom 206 were slaves. It is watered by Watauga river and its branches. The surface is mountainous and thickly wooded, and the county is rich in iron. The agricultural productions in 1850 were 87,801 bushels of Indian corn, 57,037 of oats, 43,214 lbs. of butter, 9,675 of wool, and 1,801 of tobacco. There were 21 grist mills, 9 saw mills, 7 churches, and 600 pupils attending public schools. Capital, Taylorsville. IV. An E. co. of Ky., traversed by the W. fork of Big Sandy river; area, 140 sq. m.; pop. in 1850, 3,873, of whom 80 were slaves. It abounds in sandstone and coal, and has a hilly surface with a sandy but fertile soil. The productions in 1850 were 185,120 bushels of Indian corn, 1,736 of wheat, 21,786 of oats, 9,250 lbs. of tobacco, 11,178 of

wool, and 6,820 of flax. There were 2 saw mills, 4 churches, and 805 pupils attending public schools. Capital, Paintville. V. A central co. of Ind., watered by the W. fork of White river and several smaller streams; area, 320 sq. m.; pop. in 1850, 12,101. The surface is moderately uneven, and the soil is chiefly a rich loam. The productions in 1850 were 993,375 bushels of Indian corn, 99,088 of wheat, 84,262 of oats, 41,602 lbs. of wool, and 8,082 tons of hay. There were 18 grist mills, 11 saw mills, 1 newspaper office, 85 churches, and 4,708 pupils attending public schools. The Martinsville and Jeffersonville railroads meet at Franklin, the capital. VI. A S. co. of Ill., drained by Cash river; area, 486 sq. m.; pop. in 1855, 6,946. It has a level surface and a good soil. The productions in 1850 were 133,295 bushels of Indian corn, 6,887 of wheat, 10,689 of oats, and 19,086 lbs. of butter. There were 11 grist mills, 2 saw mills, 9 churches, and 524 pupils attending public schools. Capital, Vienna. VII. A W. co. of Mo., drained by branches of Blackwater river; area, 785 sq. m.; pop. in 1856, 10,880, of whom 1,518 were slaves. The surface is mostly prairie, diversified with large tracts of timber. The soil is generally good and suitable for pasturage, and the county contains rich beds of coal. The productions of agriculture in 1850 were 445,895 bushels of Indian corn, 22,980 of wheat, 89,245 of oats, and 1,247 tons of hay. There were 18 grist mills, 11 saw mills, 12 churches, and 1,151 pupils attending public schools. The so called Pacific railroad, now in progress, will pass through Warrensburg, the capital. VIII. An E. co. of Iowa, drained by Iowa river, which is navigable by small steamboats in the S. part of the county; area, 324 sq. m.; pop. in 1859, 16,900. The surface is moderately uneven and the soil remarkably fertile. The productions in 1859 were 683,743 bushels of Indian corn, 19,513 of wheat, 28,202 of oats, 43,857 of potatoes, 198,016 lbs. of butter, 6,870 galls. of molasses, and 11,197 tons of hay. Capital, Iowa City.

JOHNSON, ALEXANDER BRYAN, an American author and banker, born in Gosport, England, May 29, 1786. He removed to the United States in 1801, and has since resided in Utica, N. Y., where he has been engaged for more than 40 years in the business of banking. He was admitted to the bar, but never practised. Early in youth he began the special studies to which he has devoted nearly all his leisure, and which may be defined as an attempt to ascertain the nature of human knowledge as it exists apart from the words in which it is expressed. Previous speculation on this problem, he affirms, had always resulted in the formation of some verbal system, while he sought a solution that should be un verbal and absolute, and applicable alike to every department of knowledge, to all subjects on which words can be employed. He has therefore not attempted to enforce any tenets, or to combat any, but simply to show the ultimate meaning of words—not their meaning as

related to each other by definition, but the ideas, irrespective of words, for which words stand. His first publication on this subject was the "Philosophy of Human Knowledge, or a Treatise on Language" (New York, 1828). It was followed by his "Treatise on Language, or the Relation which Words bear to Things" (8vo., 1838), and by his most mature work, entitled "The Meaning of Words Analyzed into Words and Unverbal Things, and Unverbal Things Classified into Intellections, Sensations, and Emotions" (12mo., 1854). In the last publication, a singularly profound and analytic production, he confessed that he had before but dimly seen the object of his search, which he had approached by slow approximations during reflections for more than 50 years. His "Physiology of the Senses, or How and What we See, Hear, Taste, Feel, and Smell" (12mo., 1856) was the earliest of his writings in the order of conception. Beside the above works, which embody his main studies, he has written frequently on miscellaneous topics; on the nature of value, capital, &c. (1813); on "Religion in its Relation to the Present Life" (1840), an argument in favor of Christianity from the congruity of its precepts with man's physical, intellectual, and emotional organization; an "Encyclopædia of Instruction, or Apologues and Breviates on Men and Manners" (12mo., 1857); and a "Guide to the Right Understanding of our American Union, or Political, Economical, and Literary Miscellanies" (12mo., 1857).

JOHNSON, ANDREW, a U. S. senator from Tennessee, born in Raleigh, N. C., Dec. 29, 1808. When he was 4 years of age he lost his father, who died from the effects of exertions to save a friend from drowning. At the age of 10 he was apprenticed to a tailor in his native city, with whom he served 7 years. His mother was unable to afford him any educational advantages, and he never attended school a day in his life. While learning his trade, however, he resolved to make an effort to educate himself. His anxiety to be able to read was particularly excited by an incident which is worthy of mention. A gentleman of Raleigh was in the habit of going into the tailor's shop and reading while the apprentice and journeymen were at work. He was an excellent reader, and his favorite book was a volume of speeches, principally of British statesmen. Johnson became interested, and his first ambition was to equal him as a reader and become familiar with those speeches. He took up the alphabet without an instructor; but by applying to the journeymen with whom he worked, he obtained a little assistance. Having acquired a knowledge of the letters, he applied for the loan of the book which he had so often heard read. The owner made him a present of it, and gave him some instruction on the use of letters in the formation of words. Thus his first exercises in spelling were in that book. By perseverance he soon learned to read, and the hours which he devoted to his education were at night after he was through his daily labor upon the

shop board. He now applied himself to books from 2 to 3 hours every night, after working from 10 to 12 hours at his trade. Having completed his apprenticeship in the autumn of 1824, he went to Laurens Court House, S. C., where he worked as a journeyman for nearly 2 years. While there he became engaged to be married, but the match was broken off by the violent opposition of the girl's mother and friends, the ground of objection being Mr. Johnson's youth and want of pecuniary means. In May, 1826, he returned to Raleigh, where he procured journey work, and remained until September. He then set out to seek his fortune in the West, carrying with him his mother, who was dependent upon him for support. He stopped at Greenville, Tenn., and commenced work as a journeyman. He remained there about 12 months, married, and soon afterward went still further westward; but failing to find a suitable place to settle, he returned to Greenville and commenced business. Up to this time his education was limited to reading, as he had never had an opportunity of learning to write or cipher; but under the instructions of his wife he learned these and other branches. The only time, however, he could devote to them was in the dead of night. The first office which he ever held was that of alderman of the village, to which he was elected in 1828. He was reelected to the same position in 1829, and again in 1830. In that year he was chosen mayor, which position he held for 3 years. In 1835 he was elected to the legislature. In the session of that year he took decided ground against a scheme of internal improvements, which he contended would not only prove a failure, but entail upon the state a burdensome debt. The measure was popular, however, and at the next election (1837) he was defeated. He became a candidate again in 1839. By this time many of the evils he had predicted from the internal improvement policy which he had opposed 4 years previous were fully demonstrated, and he was elected by a large majority. In 1840 he served as presidential elector for the state at large on the democratic ticket. He canvassed a large portion of the state, meeting upon the stump several of the leading whig orators. In 1841 he was elected to the state senate. In 1843 he was elected to congress, where, by successive elections, he served until 1853. During this period of service he was conspicuous and active in advocating, respectively, the bill for refunding the fine imposed upon Gen. Jackson at New Orleans in 1815, the annexation of Texas, the tariff of 1846, the war measures of Mr. Polk's administration, and a homestead bill. In 1853 he was elected governor of Tennessee, after an exciting canvass, in which he was opposed by Gustavus A. Henry. He was reelected in 1855, after another active contest, his competitor being Meredith P. Gentry. At the expiration of his 2d period as governor, in 1857, he was elected U. S. senator for a full term, ending March 3, 1863.

JOHNSON, CHAPMAN, an American lawyer, born in Louisa co., Va., in March, 1779, died in

Johnson

Richmond in July, 1849. He completed his education at William and Mary college, studied law under Judge St. George Tucker, and commenced the practice at Staunton in 1802. Although he met with little success at first, his talents, industry, and profound legal learning soon placed him in the front rank of the profession. In 1815 he was elected from the Staunton district to the state senate, which office he held by successive elections for 16 years. He removed from Staunton to Richmond in 1824 with a view of concentrating his extensive practice, which had spread over many of the counties of the Valley and Piedmont country. During the war of 1812 he was elected captain of a volunteer company, and was afterward appointed aid to Gen. James Breckinridge, under whom he was engaged in active service. He was a member of the convention of 1829-'30 assembled in Richmond to amend the state constitution, and was here the champion of the "white basis party." A few years before his death he retired from practice on account of ill health.

JOHNSON, EDWARD, a historian of New England, born in Kent, England, about 1600, died April 23, 1672. He emigrated to America probably with Gov. Winthrop in 1630. In 1632 he was engaged in trade at Merrimack, but appears to have resided usually at Charlestown. He was on the committee appointed to superintend the foundation of a new town and church at the place now called Woburn. In 1648 he went to Providence with Capt. Cook's party to seize Gorton, and in the same year was elected by the townsmen of Woburn a member of the legislature of Massachusetts, in which he continued to sit till 1671, with the exception of 1648. In 1655 he was chosen speaker of the house. He was recorder of Woburn from the time of its incorporation till his death. In 1665 he was one of the members deputed to hold conference with the commissioners sent from England by Charles II. He wrote a "History of New England from the English Planting in 1628 till 1652, or Wonder-Working Providence of Zion's Saviour" (London, 1654), which, notwithstanding its defective and desultory style, is interesting and valuable. It has been reprinted in the 2d series of the Massachusetts historical collections, scattered through vols. ii., iii., iv., vii., viii.

JOHNSON, ISAAC, one of the original colonizers of Massachusetts, born in Clipsham, Rutlandshire, England, died in Boston, Sept. 30, 1630. He arrived at Salem with his wife, June 12, 1630, and was one of the 4 persons who founded the first church at Charlestown in the following month. The water there however being bad, Mr. Johnson and some others removed to Shawmut, now Boston, where was "an excellent spring." He superintended the first settlement of Boston, was a good, wise, and wealthy man, and bequeathed, at his death, considerable property to the colony.—ARBELLA, or ARABELLA, wife of the preceding, and daughter of Thomas, 14th earl of Lincoln, accompanied her husband to New England, and died in

Salem in the August subsequent to her arrival. She was usually styled the "lady Arbella," and was highly esteemed by Winthrop, who changed the name of his ship, and called it after her.

JOHNSON, MANUEL JOHN, an English astronomer, born in 1805, died in Oxford, Feb. 28, 1859. He was educated at Addiscombe, and in 1821 entered the army. During the leisure of a 10 years' military residence in St. Helena he devoted himself to astronomical observations, and mainly by his exertions an observatory was erected on the island. Working in this with great assiduity he produced in 1835 a "Catalogue of 606 principal Fixed Stars of the Southern Hemisphere." Upon the disbanding of the artillery corps he returned to England, entered at Magdalen college, Oxford, and was graduated in due course. Scarcely had he taken his degree when he was appointed astronomer at the Radcliffe observatory. He immediately commenced the re-observation of all the stars, more than 4,000 in number, included in the Groombridge catalogue, to which he added 1,500 other stars not found in it, recording his observations in vols. xl. to liii. of the Radcliffe observatory. These were designed for ultimate collection in one large catalogue of circumpolar stars, a work which Mr. Johnson did not live to complete. Subsequent to 1849 he devoted much time to observations with the great heliometer of the Radcliffe observatory, with a view of determining the parallaxes of the fixed stars. Two series of these have been published.

JOHNSON, REVERDY, an American lawyer and statesman, born in Annapolis, Md., May 21, 1796. He was educated at St. John's college in that city, and at the age of 17 began to study law in Prince George's co. in the office of his father, who was chief justice of the judicial district of which that county was a part. In 1815 he was admitted to the bar, and in 1817 removed to Baltimore, where he has ever since resided. He has devoted much of his time to the arguing of cases before the U. S. supreme court. In conjunction with Mr. Thomas Harris he reported 7 vols. of the decisions of the Maryland court of appeals, known as "Harris's and Johnson's Reports," the 1st vol. of which appeared in 1820 and the 7th in 1827. In 1821 he was elected a state senator, and at the expiration of his term in 1825 he was reelected for a second term. In 1845 he was chosen a U. S. senator, which office he resigned in 1849 on being appointed by President Taylor attorney-general of the United States. On the succession of Mr. Fillmore after the death of President Taylor, Mr. Johnson resigned that office, and resumed in Baltimore the practice of the law, which he has since constantly pursued.

JOHNSON, RICHARD MENTOR, an American statesman and soldier, born at Floyd's station, near Louisville, Ky., Oct. 17, 1780, died in Frankfort, Nov. 19, 1850. He was educated at Transylvania university, and subsequently studied law and practised with success. He commenced his public career as a member of the

Kentucky legislature, to which he was elected at the age of 23, and in 1807 was returned to congress, and remained a member of the house until 1819. He was a firm supporter of the administration of President Madison, and upon the commencement of the war of 1812 raised a body of Kentucky mounted riflemen, whom he commanded, with the rank of colonel, on the Canadian frontier. He resumed his legislative duties in the autumn of that year, but upon the adjournment of congress in the spring of 1818 he immediately raised another mounted regiment, with which he was employed for several months on the Indian frontier. In September he joined Gen. Harrison, then in pursuit of Proctor, and by the decisive charge of his mounted volunteers mainly contributed to the brilliant victory gained over the British and Indians at the battle of the Thames, Oct. 5. Col. Johnson fought with distinguished valor in this engagement, and it was by his hand that the Indian leader Tecumseh is commonly supposed to have fallen. He was carried from the field desperately wounded, his person, clothing, and horse having been pierced by upward of 25 bullets; but in the following February he resumed his seat in congress. In 1819 he was elected to fill a vacancy in the U. S. senate, of which he continued a member until 1829, when he was again returned to the house of representatives. He remained a member until his election by the senate in March, 1837, as vice-president of the United States, no one of the candidates for that office having had a majority of votes in the electoral college, although Col. Johnson's plurality was very large. He discharged the duties of presiding officer of the senate for 4 years, and in the presidential election of 1840 was an unsuccessful candidate of the democratic party for vice-president. He returned to his farm in Scott co., Ky., after upward of 84 years' continuous public service, and thenceforth lived chiefly in retirement. He was, however, serving a term in the state legislature at the time of his death. In congress his chief efforts were against the discontinuance of the Sunday mails, and in behalf of soldiers of the revolution or of the war of 1812, who applied for pensions. He was the author of the law abolishing imprisonment for debt in Kentucky. He was buried in the state cemetery at Frankfort, at the base of the public military monument.

JOHNSON, SAMUEL, D.D., first president of King's (now Columbia) college, New York, born in Guilford, Conn., Oct. 14, 1696, died in Stratford, Conn., June 6, 1772. He was graduated at Yale college in 1714, and two years later was appointed tutor there. In 1720 he resigned his tutorship to receive ordination as a Congregational minister, and settled at West Haven in order to enjoy the advantages of the college library. He relinquished his pastoral charge in 1722, and soon after, in company with Mr. Cutler, rector of the college, and another gentleman, sailed for England, where they received Episcopal ordination in 1723, and in May Mr.

Johnson received the degree of A.M. from the university of Oxford. Shortly after he returned to America, bearing a commission as missionary of the society for the propagation of the gospel in foreign parts, and settled in Stratford, Conn., as rector of an Episcopal church there. In 1748 he received the degree of D.D. from the university of Oxford. In 1746 he published a work on ethics entitled "A System of Morality," and in 1752 a compend of logic and metaphysics, and another of ethics, originally prepared for the use of his sons; the two latter were printed in Philadelphia by Dr. Franklin as text books for the university of Pennsylvania. In 1755 he was offered the presidency of that university, but declined it. In 1753 he was invited to accept the presidency of the newly founded college in New York, in all the plans for which he had been consulted. He did so with reluctance, but entered upon his duties with great zeal, and, in addition to teaching the classes, assisted in planning the college edifices, and made earnest appeals to his friends in England for assistance in its endowment. During the 9 years of his presidency he lost his wife, younger son, and stepson, and he became so much depressed as to be unwilling to remain longer in charge of the college. He accordingly wrote to England for a successor, and in 1763 resigned and returned to Stratford. During his presidency he published one or two small works, and after his return to Stratford, where he resumed his parochial duties, revised his previous works, and published an English and a Hebrew grammar.

JOHNSON, SAMUEL, LL.D., an English essayist, poet, and lexicographer, born in Lichfield, Sept. 18, 1709, died in London, Dec. 18, 1784. His father, Michael Johnson, was a bookseller and stationer, and for some time was a magistrate of Lichfield; but his fortune was limited, and dying in middle age, he left his family in poverty. From his birth the younger Johnson was afflicted with a malignant scrofula which permanently disfigured his face, and injured both his sight and hearing. At 10 years of age he commenced the study of Latin at the Lichfield free school, and by the united agencies of great natural aptitude and severe discipline he made a fair proficiency. He remained there about 5 years, and another year at a private academy in Stourbridge. On account of his father's poverty his entrance at Oxford was delayed for two years, during which time he amused himself chiefly in reading the books in his father's shop. At length a schoolmate, the son of a neighboring gentleman, was about to go up to Oxford, and it was arranged that young Johnson should accompany him as assistant and fellow student. He was accordingly admitted to Pembroke college as a commoner in 1728. His college life was disorderly, but not vicious. He especially distinguished himself in a Latin translation of Pope's "Messiah," for which he received the applause of his college, while Pope himself declared that it would be a question for posterity which was the original and which the transla-

tion. While at Oxford he showed signs of the morbid state of his brain and nervous system which affected him in all his after life; but by skilful treatment, and the strong will of the patient, the disease was held in check, and the threatened wreck of intellect averted. He remained at the university about 8 years, and left on account of poverty without a degree. Only a few weeks later his father died, leaving but little property, and Johnson procured employment as an usher in a school at Market Bosworth, Leicestershire. He next spent some time at Birmingham, which was then an inconsiderable country town, with a bookseller, who also published a small newspaper, to which Johnson contributed. Here he became acquainted with the family of Mr. Porter, a linen draper, whose widow he afterward married. About this time he executed his first literary work, a translation of Father Lobo's "Voyage to Abyssinia." He soon after issued proposals to publish by subscription the Latin poems of Politian, with a history of Latin poetry from the age of Petrarch to the time of Politian; but the work was never completed. He spent his time alternately at Birmingham and Lichfield, till after two years he was married to Mrs. Porter, a lady of nearly twice his age, and then he opened a private academy at Edial Hall, near Lichfield. But he obtained only three pupils, two of whom were David Garrick and his younger brother; and after trial of a year and a half the enterprise was abandoned.—In the spring of 1787 he set out for London accompanied by Garrick, determined to force his fortune in the world of letters. How he disposed of himself on his arrival in London is only partially known. He sought employment among the booksellers, and lived at the most economical rates, bearing all his privations and discouragement with a sullen fortitude. With Cave, the publisher of the "Gentleman's Magazine," he had a slight second-hand acquaintance before he left Lichfield, which was now turned to account, and Johnson became a steady contributor and at length assistant editor to that publication. It was while thus occupied that he first became known to the London public by the publication of "London," a poem (1788), in imitation of the third satire of Juvenal, which was received with decided favor. His experience of life in London, however, made him quite willing to accept the mastership of a school at Appleby, to which he was recommended; but on application it was found that his want of a degree disqualified him, by the statutes of the corporation. A like difficulty stood in the way of his entering the legal profession, to which he next turned, and so he continued his labors in the service of the publishers. He now wrote still more extensively for the "Gentleman's Magazine," contributing a class of papers in biography and general literature which gave a new and higher character to that work. He also wrote two or three political pamphlets against Walpole and the whig administration. At the beginning of

the session of parliament in Nov. 1740, Johnson took charge of the debates, as published in the magazine. As the session advanced, his reports attracted no little attention. The eloquence, force of argument, and splendor of diction displayed in the speeches excited universal admiration. It was his method to ascertain the order in which the several speakers rose, and the general drift of their arguments, and, guided by this information and his knowledge of the style and manner of each speaker, he would write out the debates as they appeared in the successive issues of the magazine. The secret of their authorship was not revealed till some years later. The sale of the magazine was greatly increased during their publication; but after a little more than two years Johnson relinquished the position, because he doubted the morality of the deception he was practising upon the world, though he still retained his connection with the magazine. Early in 1744 was published the "Life of Richard Savage," which Johnson had promised to the public immediately upon the death of its subject, a few months before. The book contributed very considerably to fix the reputation of its author. The next year, among other literary labors, he wrote the preface and index to the Harleian miscellany. That famous collection of old and valuable pamphlets from the library of the earl of Oxford, which had been purchased by the bookseller Osborne, required also a great amount of physical labor in its preparation. In that painful drudgery Johnson toiled as a day laborer, and was treated by Osborne accordingly. The insolence of this "most rapacious and brutal of booksellers" once provoked Johnson to knock him down. Of this affair many stories were told. Johnson, when asked by Boswell what the truth was, replied: "Sir, he was impertinent to me and I beat him; but it was not in his shop, it was in my own chamber." The same year he issued a pamphlet entitled "Miscellaneous Observations on the Tragedy of Macbeth," to which he affixed proposals for a new edition of Shakespeare. This plan was laid aside for some years, but the pamphlet fell into the hands of Warburton, who was then engaged in a similar work, and was commended by him, as evidently the work of "a man of parts." In 1747 Garrick became joint manager of Drury Lane theatre, and Johnson was requested to prepare a prologue to be spoken at its opening under the new management. Though a piece of only about 60 lines, it added greatly to its author's reputation. In this year he issued proposals for his "Dictionary of the English Language." How he was first led to that great undertaking is not very clearly determined, though he had evidently contemplated it a long time. The plan of the work, as then published, indicates a thorough acquaintance with the subject, and a comprehensive knowledge of the method to be pursued in its prosecution. The "Plan" was addressed to the earl of Chesterfield, then one of the secretaries of state, who

was known to be ambitious of the reputation of a patron of learning, and had expressed a warm interest in the enterprise. The language used was at once dignified and complimentary, and the impression made upon the noble lord was decidedly favorable; but the association of two characters so unlike and yet so unyielding could be neither cordial nor lasting. Five publishing houses, among them Dodsley and the Longmans, were concerned in the contract. Johnson was to receive £1,575, which amount however was to cover all the incidental expenses of preparing the work for the press. To facilitate his work he removed to Gough square in Fleet street, where he had rooms properly arranged for its prosecution, being assisted by 6 copyists. He availed himself of whatever helps were offered in the extant works on English philology and lexicography, but relied chiefly on his own original labors, gathering his materials from the unharvested fields of English literature. This great work occupied its author, though not exclusively, during the next 7 years. A trip to Tunbridge Wells, in the summer of 1748, brought him into contact with some of the celebrities of the metropolis, among them William Pitt, Lord Lyttelton, Speaker Onslow, and Garrick. The marked attention paid to him by these distinguished personages was the more acceptable to him, since, though it was new, he felt that it was not undeserved. To facilitate his intercourse with his literary associates, he also this year originated a club, called from its place of meeting the "Ivy Lane Club." At its organization it consisted of 10 members, of whom Johnson, Hawkins, and Dyer afterward belonged to the celebrated "Literary Club." Meanwhile he continued his contributions to the periodical press. In 1748 Dodsley brought out his "Preceptor," a compilation of choice pieces for young persons, in which first appeared the "Vision of Theodore, the Hermit of Teneriffe." To this year also belongs his second and best poetical production, "The Vanity of Human Wishes," an imitation of the 10th satire of Juvenal. It was printed by Dodsley, and brought its author 15 guineas. While yet residing at Lichfield Johnson had commenced a tragedy, in 5 acts, called "Irene," which he finished during his first two or three years in London. It had since then been an unsuccessful suitor for a place on the metropolitan stage, until Garrick, soon after his accession to the management of Drury Lane theatre, undertook to bring it out. The play, however, was ill adapted to the stage, and despite the remonstrances of the author, it was necessary to make very considerable changes, and to lop off some of its most elaborate portions. Its success was but partial. It was acted for 9 successive nights, before tolerably large and highly respectable audiences, and was received with a good share of favor. The author's profits amounted to £200, and the copyright brought him another £100, making together a larger amount than he had hitherto received on any one occasion. The merits of "Irene" have been

very differently estimated. It confessedly lacks the vivacity, the keenness, and especially the dramatic illusions required in writings for the stage; but simply as a poem to be read in private it has many excellences.—On March 20, 1750, Johnson issued, unheralded, the first number of the "Rambler," being chiefly an elaborate preliminary essay, introducing a series of miscellaneous papers, which were promised for each succeeding Saturday and Tuesday. The new periodical made little stir at first, but by degrees the public became sensible of its excellence. Its authorship was not publicly confessed, but it was readily identified by all who knew any thing of Johnson's style, nor did he affect any great secrecy in the matter. For two years the semi-weekly issues were continued without omission; the character of the essays was sustained to the end, and the last number admirably concluded the whole with a dignified valedictory. In projecting and carrying forward this work, Johnson had neither counsellors nor assistants. Of its 208 numbers he was the sole author of all but 8, and of these 4 were partly written by him. It is pretty well ascertained that when the first number was printed none of its successors were written; and of the 200 pieces by the author's own hand, not more than 80 were from materials previously arranged. Such a work would have seemed a great one had it been the sole occupation of the writer during the period of its progress, but at the same time he was chiefly occupied with his dictionary, which was then rapidly approaching its completion. During this portion of his life his mind was remarkably vigorous and fruitful, and its vast accumulations were thrown off in profusion and with great facility. The "Rambler," though greatly admired by the most competent judges, was coldly received by the public as a periodical; but when collected into volumes it became immediately popular. Its last issue was a noble effort of self-possessed greatness, calmly reviewing its own accomplished work and justly estimating its value. About this period Johnson was concerned in an affair that for a time exposed him to the suspicion of even some of his best friends—an attempt to prove Milton guilty of a wholesale plagiarism in his "Paradise Lost." One Lauder, a Scotch schoolmaster, pretended to have found a large share of the best portions of Milton's great poem among the works of the modern Latin poets; his proofs of this grave charge were embodied in a pamphlet, to which Johnson was induced to write a preface and postscript, thus by implication approving the whole production. That he was the dupe of the impudent Scotchman is very evident, though it is scarcely less certain that his own political prejudices had a determining influence upon his mind. But the whole affair was presently brought to the light, and the intended disgrace of the great poet made to recoil upon the libellous critic and his abettors. Lauder's pretended quotations from the modern Latin poets were found to be either

taken from Hogg's Latin version of "Paradise Lost," or pure forgeries. Johnson was deeply chagrined, and at once acknowledged his own error, and compelled Lauder to publicly confess his falsehood. Though Johnson had a strong dislike of Milton's politics, he still highly appreciated his genius, and of this he about this time gave a practical demonstration. There was then residing in London a granddaughter of the great poet, in deep poverty, for whose benefit it was arranged that the "Comus" of Milton should be produced in Drury Lane theatre. Johnson entered into the arrangement with characteristic zeal, and wrote the prologue for the occasion, which was spoken by Garrick. Early in the spring of 1752 a dark shadow was thrown over Johnson's otherwise brightening affairs by the death of his wife. Notwithstanding the disparity of their ages, it was evident that the passionate affection in which their union began had only on his part changed into a settled esteem, of which he gave sufficient proofs while she lived, but still more on the occasion of her decease. At her bedside he was so convulsed with grief that he seemed to lose all self-control till soothed by the exercises of religion; and yet while she lay a corpse awaiting burial he composed a funeral sermon to be spoken over her remains. His published "Prayers and Meditations" indicate the depth and permanence of his sorrow at that event. He contemplated his departed wife as only removed from his sensible observation, though probably not from his presence. He therefore prayed that, if agreeable to the will of God, he might be favored with her guardianship, and with intimations of her presence, "by appearances, impulses, dreams, or in any other manner agreeable to the divine government." In 1752 Johnson engaged with Dr. Hawkesworth in the publication of the "Adventurer," a series of periodical essays on the plan of the "Rambler." Of these 140 numbers appeared, 29 of which were written by Dr. Johnson. In 1755 the dictionary was completed. Lord Chesterfield, sensible of the value of a dedication from a man who was now acknowledged as one of the first living writers, tried to soothe Johnson's wounded pride and obliterate the remembrance of the coolness with which he had received the "Plan" by two laudatory letters in "The World," shortly before the work was printed. But Johnson's manly spirit rejected these tardy advances, and he addressed to his noble patron such a letter as only insulted dignity in distress could indite to supercilious meanness inflated with vanity. The dictionary was accordingly issued without a dedication. The original preface was at once a characteristic and a highly valuable essay. It enumerated some of the difficulties attending such a work, and the methods the author had used to overcome them, and also dwelt at some length upon his desolations, but only in the spirit of indomitable independence. The merits of Johnson's dictionary are too well known to require any statement in this place. It first brought order

out of the chaos of the language; and though it has been generally superseded by later compilations, yet the fundamental excellences of all modern dictionaries of the English language have their elements in that work, and its author must always stand the confessed founder of English lexicography.—The publication of the dictionary greatly enhanced its author's reputation, but it brought no relief to his finances. His poverty pressed upon him as painfully as at any former time. He was still compelled to labor unremittingly for the means of daily subsistence, and in one case was actually arrested for a debt of £5, and escaped imprisonment only through the solicited aid of a friend. Among other writings, he published at this time a large number of reviews in Newbery's "Literary Magazine." The proposal for an edition of Shakespeare made some years before, but not prosecuted, was renewed and a subscription opened, but the work still lingered on his hands through 9 years. He next engaged with the publishers of the "Universal Chronicle," a weekly newspaper, to furnish a series of miscellaneous essays, and the numbers of the "Idler," written by Johnson, appeared in regular order for two successive years, beginning in April, 1758. As compared with the "Rambler," the "Idler" is more sprightly and varied, but less profound and serious; its style is more natural and simple, but its matter is less valuable intrinsically. Of its 108 numbers Johnson wrote all but 12; but it was quite evident that they cost him but little more labor than the manual exercise of writing. In the spring of 1759 he issued "Rasselas, Prince of Abyssinia," probably the most celebrated of all his productions. Like many other of his works, this was the creature of an immediately pressing occasion. His mother, whom he had left in her widowhood at Lichfield more than 20 years before, and had never since visited, though he had shared with her his scanty income, died early in this year. Her death made a new demand on his purse, to meet which, in the evenings of one week, he wrote the whole of "Rasselas," and sent it to the printer as it was first written, receiving for it £100, out of which he paid the expenses of his mother's funeral. In its scene and imagery the story has an oriental character, but its style and matter are purely Johnsonian. The vanity of life, as in most of his moral writings, is the lesson it teaches, and over against this is placed the divine providence and the intrinsic excellence and practical worth of virtue. But if Johnson's literary labors had failed to provide him a competence, they had procured for him a greatly advanced social position, and secured him a large circle of admirers. His constitutional indolence had however become positively morbid, and he indulged in idleness just as far as his immediate necessities would allow. He seldom went abroad, lay in bed till past noon, and spent the rest of the day in promiscuous conversations with whomsoever called upon him; or moped in morbid melancholy if left

to himself, which, however, was not often the case. To his guests he devoted a large share of each afternoon, meanwhile regaling himself with his favorite tea, with which he solaced both his earlier and his later hours. Among his personal associates, and those who sought him at this period of his history, were several persons of distinction, and some whose names have come down to the present time, as Richardson the novelist, Garrick, Joshua Reynolds, Warton of Oxford (through whose good offices he had just before received the degree of M.A., which was first publicly recognized in the title page of the first edition of the dictionary), Baretti, Arthur Murphy, Dr. Charles Burney, Dr. (afterward Bishop) Percy, Bennet Langton, and Topham Beauclerk. He was all this time domiciled at Gough square, where he had passed the greater portion of the years of his residence in London. Here, some time before the decease of his wife, he had begun to gather about him a family group, which was afterward much enlarged, made up of a strangely assorted set of dependants and pensioners upon his charity. Mrs. Anna Williams, a blind lady, the daughter of a Welsh physician; "Doctor" Robert Levett, an odd little man who practised medicine among the poorest of the poor, and often received his fees in liquor; Mrs. Desmoulins and her daughter, who had no other claim upon his benevolence than the service which that lady's father, Dr. Swinfen, had rendered to Johnson in a professional capacity in his youth; and Francis Barber, his negro servant, were among the inmates of his house.—Johnson had an implicit belief in the supernatural and invisible world. He held the Christian faith with simplicity, and accepted the Bible as divine truth. The best balanced minds often find it difficult to define the precise line of demarcation between rational belief and superstition, and Johnson made no attempts at it. He practically adopted the maxim of certain church fathers, that it is safer to believe too much than too little. He believed in the existence of disembodied spirits, and that they might be manifested to our cognizance, and so he was ready to listen to evidence going to confirm such apparitions. A case of this kind occurred in 1768, which exposed Johnson to the ridicule of his enemies. Certain strange phenomena in the form of "rappings" about the bed of a young girl, in a house in Cock lane, Clerkenwell, caused a considerable excitement, and the rector of the parish, with "a number of gentlemen eminent for rank and character," of whom Johnson was one, attempted to solve the mystery. Their examinations satisfied them that the whole was a cheat and imposture, and Johnson afterward wrote out a statement of it for the "Gentleman's Magazine." But the affair was seized upon by Johnson's enemies, as exposing a vulnerable point for their attacks. Churchill, in his poem, "The Ghost," depicted Johnson in such broad caricature that it was at once recognized; and Foote the comedian proposed to

present him on the stage for the amusement of the town, but abandoned his purpose upon being assured that Johnson was preparing to chastise him if he undertook it.—In 1762 Johnson received from the king a pension of £300. He had so often in his own strong language stigmatized the whole business of giving and receiving pensions as the basest kind of bribery and espionage, that it seemed impossible that he should accept the royal bounty. But it being urged by his friends that the whole nation was his debtor for what he had written, and especially for the dictionary, and the premier assuring him that no service to the ministry would ever be expected from his pen in return for the favor, he allowed his scruples to be overcome. Early in 1765 the long promised and long delayed edition of Shakespeare made its appearance, enriched with an elaborate preface, discussing the genius and writings of the dramatist, and with a concise account of each play, and notes and commentaries, both original and selected, on various passages. But the work had been performed wholly as a task, and it was not such as the reputation of the editor had promised. He no doubt possessed many valuable qualifications for such a work, yet he was better adapted for original compositions, and in this case his powers were but moderately called into requisition. His own estimate of the work did not differ greatly from that of others. He had now fully attained the height of his ambition as a scholar and man of letters. His claim to the first place among his peers was cheerfully conceded to him with almost absolute unanimity. The university of Oxford, from which he sought in vain for the degree of M.A. when it would have been valuable to him, but which gave it unasked when he was able to do without it, now accorded a tardy recognition of his greatness by granting to him by diploma the degree of LL.D. He had received the same honor 10 years earlier from Dublin university; but after returning thanks for the honor, he declined to wear it, and would not consent to be called doctor till his own Oxford had given him the title.—About this time Johnson was introduced by Arthur Murphy to Mr. Thrale, a wealthy brewer of Southwark. Mr. Thrale was a man of a well cultivated mind, of sound judgment, and great force of character, and his wife, whose name has become intimately connected with Johnson's history, was also a person of some learning and of almost unbounded vivacity, flippant, versatile, and addicted to hero worship. The parties were mutually pleased with each other, and the acquaintance thus begun soon grew into friendship. Johnson dined with his new friends weekly during several succeeding months, when, having suffered somewhat by an attack of sickness, he was removed in 1766 to their residence, and had apartments assigned him in their house at Southwark, and also in their villa at Streatham. Mr. Thrale was a member of parliament for Southwark, and as his political creed was nearly

allied to that of his guest, Johnson became interested in the politics of the times, and there was at one time a purpose to bring him into parliament; the measure had his hearty concurrence, but the government, fearing that he would not prove sufficiently facile, did not encourage it, and so the design was abandoned. He accompanied his friends on their annual excursions, visiting various parts of the kingdom with them, and also making a visit of several weeks at Paris. His connection with this family not only brought him innumerable comforts and rational pleasures of which he must otherwise have been deprived, but it also afforded him a retreat from his own strangely assorted household, where strifes and complaints were loud and frequent. It continued till it was virtually broken up by the death of Mr. Thrale, who left no son, and the subsequent marriage of his widow to Signor Piozzi, greatly to the chagrin of her numerous friends.—A few years previous to his connection with the Thrales, Johnson had formed another association, by which his future renown was to be very largely affected. In 1763 James Boswell, then a young man of 22 or 23, the son of a Scotch judge in the court of session, visited London, inflamed with a romantic passion to make the acquaintance of its great men; and by diligent efforts he at length obtained an introduction to Johnson. Boswell had but little that adapted him to command even ordinary respect. He was loose in his manner of living, and still more so in his conversation; conceited, meddling, and inquisitive; a sycophantic worshipper of greatness, real or imaginary, yet strongly endowed with an insight into character, and a reverential appreciation of qualities the furthest possible removed from his own. Johnson, absurdly enough, fancied this madcap lion-hunting young Scot on first acquaintance, and of course Boswell at once fastened himself upon his venerable friend. They were together almost daily from the time of their first meeting till Boswell was compelled to leave the city, rambling in the parks, supping together at the Mitre tavern, Johnson's principal resort, or wandering the streets till after midnight. Johnson was glad to have somebody as idle as himself to listen to him, and to submit to his exactions; and Boswell was quite ready to purchase the favor of the company of a great man at almost any price. From that time to the death of his great friend, Boswell lived in Johnson's shadow. Whenever it was possible he was with him, following him wherever he went, noting his words, describing his manners, and detailing the most trivial occurrences; all of which were afterward embodied in his "Life of Johnson," at once the best and the worst of biographies. It is by Boswell's biography much more than by the dictionary or the "Rambler," or even by "Rasselas" and the "Vanity of Human Wishes," that Johnson is known to the present generation; and while the biographer has immortalized his own name as a proverb of con-

tempt, he has doubtless permanently damaged the reputation of his subject by presenting his foibles in caricature.—The founding of the "Literary Club," an institution intimately associated with the name of Johnson, belonged to this period. Reynolds took the lead in the movement, and so was called their Romulus; but Johnson was the Nestor, the Ajax, and perhaps in some sense the Thersites of the host. Among the original 9 members were Sir John Hawkins, Langton, Beauclerk, Goldsmith, and Burke. Goldsmith had a few years before become somewhat intimate with Johnson, by whom he was greatly esteemed as a writer, and cherished as an associate. Burke, too, had not long before made Johnson's acquaintance, while living as a literary adventurer among the booksellers; and though the two were widely removed from each other by diversity of age, and still more by their opinions, yet Johnson highly appreciated his young friend's genius, and from scarcely any other was he so tolerant of opposition. During its earlier years the club held weekly meetings for conversation, which contributed not a little to maintain the balance of Johnson's strangely affected mind. New members were admitted with great caution, and for several years the whole number did not exceed 12. In 1778 it had grown to 26, and two years later to 35, when 40 was fixed as its complement. The club is still in existence, but it has become rather a learned than a convivial society. Johnson's indolent and purposeless mode of life proved highly unfavorable to his spirits. His "Prayers and Meditations," published since his decease, indicate the unhappy state of his mind. He was accustomed to write bitter things against himself in his penitential moments, and especially during Lent, which he observed somewhat exactly, as a preparation for the sacrament, which he usually received on Easter Sunday. Sometimes his melancholy assumed the form of a diseased condition, and verged almost on insanity; and again he would pass suddenly to the opposite extreme, and give way to the most extravagant bursts of hilarity. His ordinary manners, especially in his later years, were strangely eccentric. He talked much to himself, muttering in a vocal but generally inaudible undertone. He was never still, but sat with head inclined over the right shoulder, his vast trunk swaying backward and forward, and his hand keeping up a corresponding motion upon his knee. At times he would make a kind of clucking sound, and again a suppressed whistle, and still more frequently a humming noise, accompanied with a vacant smile. His conversation was often violent and discourteous in manner, and he delighted in contradictions. These were the troublesome remains of his early mental disorders, and among his more intimate friends they were understood and reckoned harmless. During the years from 1770 to 1775 he produced several rather important political pamphlets, all in the interest of the government, and designed to meet some immediate necessity. In

1770, at the time of the excitement caused by the affair of John Wilkes, Johnson wrote the "False Alarm," defending the action of the house of commons in vacating Mr. Wilkes's seat; but he failed to satisfy the nation, or permanently to sustain the position assumed by the dominant party. In 1771 he published "Thoughts on the Falkland Islands," to dissuade the nation from going to war with Spain for that remote and valueless possession. Just before the general election of 1774 he published the "Patriot," to persuade the electors that those who opposed the ruling administration were not true to their country, and therefore should not be intrusted with power. Last of all, in 1775, he published "Taxation no Tyranny," in opposition to the remonstrance of the American congress against the action of the government in taxing the colonies without their consent. He fully sustained the ministry in all their measures against the colonies, and predicted the speedy subjection of America to the power of the mother country. In these several tracts Johnson uttered the same political sentiments that he had uniformly professed through his whole life; for from the first he was a high tory, and as he wrote only his own opinions, so he did it without solicitation or reward from the government. In 1778 he made a tour to the highlands of Scotland and the Hebrides, which was undertaken by the persuasion of Boswell, who became his fellow traveller, and afterward the chronicler of the journey, of which an account was also written by Johnson. He had always entertained an unreasoning prejudice against everything Scotch, and seemed now to go out to explore what he had already condemned. The next year he made a tour in Wales with Mr. and Mrs. Thrale. While in Scotland Johnson made inquiries respecting the original manuscripts from which Mr. Macpherson pretended to have translated the poems of Ossian, and came away confirmed in the conviction that a large share of that work was a forgery, and the rest of comparatively modern origin. His avowal of this conviction after his return raised a great noise among the admirers of that production, and led to a violent controversy between himself and the professed translator, which scarcely stopped short of a physical encounter. His last considerable literary work, the "Lives of the English Poets," in 4 volumes, appeared from 1779 to 1781, when their author was over 70 years old—a series undertaken at the request of the booksellers, and performed dilatorily and by irregular impulses. In some respects this was one of the best written of all his works, simple in its style, genial and appreciative in its spirit, and full of interesting statements and valuable criticisms.—About the date of the close of that work the hand of death began to be busy with those about him. Mr. Thrale died in 1781, of which event he wrote: "I looked for the last time upon the face, that for 15 years had never been turned upon me but with respect and benignity. Farewell! May God,

that delighteth in mercy, have had mercy upon thee." A few months later he removed to his own house. In 1782 Levett died, and a year later Mrs. Williams followed him. Some time before the last event he had suffered from a partial paralysis of the vocal organs, from which however he soon recovered. In the latter part of the same summer he once more visited his native town; but as winter drew on he was again brought down, and his whole system became swollen with dropsy. By the assiduity of his friends, and skilful medical treatment, he so far recovered that during the next summer he visited Derbyshire and was again at Lichfield. Late in the following autumn he grew worse. To physical suffering he was comparatively indifferent, and when near his end he earnestly entreated his attendants to spare no efforts, however painful, to prolong his life. He anticipated death with an awful horror, and with most piteous moanings and tears he prayed for mercy; but as his last hour approached his forebodings at length gave place to humble confidence in the divine clemency.—Few names are more conspicuous in the annals of English literature than that of Dr. Johnson, of which he adorned almost every department. Though scarcely reckoned among English poets, his productions in that department sufficiently vindicate his claim to a recognition, and not a few judicious critics have believed that with equal devotion to that kind of writing he would have rivalled Pope or Dryden. As an essayist he is ranked with Addison and Steele, whom he imitated only as to the form of his pieces, impressing whatever he thus wrote with his own individuality. He lacked their vivacity and variety, and especially their genial good humor, but surpassed them in depth of reflection and nervous energy of style. He especially excelled in biographical writing, and among his numerous sketches of personal histories and mental portraits are some that may be studied as models of their kind. As a critic, his judgment was clear and discriminating, and such was his independence that he often condemned the popular favorites of the day, and in most cases posterity has confirmed his decisions. His fictions are chiefly moral allegories; for so fully was he intent on inculcating the practical lesson of life, that it was constantly before him, and gave form and coloring to his purely imaginative productions.—The only complete edition of Johnson's works is in 11 vols. 8vo. (Oxford, 1825). There is an edition by Sir John Hawkins with a life (15 vols. 8vo., London, 1787-'9), and a good collection, comprising nearly all his writings except the parliamentary debates, with a life by Arthur Murphy, in 2 vols. 8vo. (London and New York).

JOHNSON, WALTER ROGERS, an American physician, born in Leominster, Mass., in 1794, died in Washington, D. C., April 26, 1852. He acquired means to fit himself for college by teaching in the public schools, and was graduated at Harvard in 1819. He was principal of the Framingham academy for a year, devoting his leisure

to the study of law and belles-lettres, and then took charge of a small classical school at Salem, Mass., intended to prepare gentlemen's sons for business. In 1821 he became principal of the academy at Germantown, Penn. For 5 years, during which the academy constantly increased in reputation and prosperity, his vacations and most of his leisure hours were devoted to travelling through the state, gathering facts and statistics bearing upon the subject of popular education, securing the coöperation of the most prominent men in the state in the common school cause, and publishing several essays on the subject. In 1826 the Franklin institute determined to establish a high school in Philadelphia, with the special purpose of affording the industrial classes cheap instruction in sciences and arts, and requested Mr. Johnson to draw up a system of instruction for them, and take the chair of mechanics and natural philosophy in the school. He accepted the invitation, and removed to Philadelphia. He added to his instructions in the school a public course of lectures on mechanics and philosophy, under the direction of the institute, which were largely attended by both sexes. His efforts in behalf of common schools were also continued, and in 1834 he saw them crowned with success. About 1836 the high school was superseded by a general school system, but Mr. Johnson's course of lectures was continued. In the mean time he had been engaged in scientific researches on the strength of materials and the best construction of steam boilers, on steam, heat, electricity, magnetism, &c. His investigation on the greater strength of iron after powerful tension at an increased temperature, was begun at the order of the U. S. government, but never completed. In 1836 he commenced a series of geological investigations, with special reference to the coal formations and iron ores of Pennsylvania. In 1837 he was appointed to take charge of the department of magnetism, electricity, and astronomy in the U. S. exploring expedition, and resigned his professorship to prepare for these duties; but the subsequent changes and reduction of the original plan led to the dissolution of his connection with it. He pursued his investigations meantime in geology, and in 1839 was appointed to the chair of chemistry and physics in the medical department of the university of Pennsylvania. He retained this professorship 4 years, when he resigned it to enter upon a course of investigations, under the authority of congress, into the character of the different varieties of coal, and their absolute and relative values for generating steam and heat, and producing illuminating gas. His report on this subject was published in 1844. He subsequently made scientific researches on other subjects connected with the navy department, such as floating docks, steamboat explosions, the corrosion of sheathing copper, &c.; and in 1845, under appointment of the city authorities of Boston, he examined the sources from which a supply of pure water might be

brought to that city. For the next 3 years he was engaged in preparing and adapting to American wants several of the works of the German physicists Knapp, Müller, and Wiesbach. He participated in the organization of the American association of geologists, and, at its subsequent reorganization as the American association for the advancement of science, was its first secretary. In 1848 he removed to Washington, and in 1851 visited Europe, where he was connected with the London world's fair.

JOHNSON, SIR WILLIAM, baronet, superintendent-general of Indian affairs in North America before the American revolution, colonel of the Six Nations, and a major-general in the British service, born in Smithtown, co. of Meath, Ireland, in 1715, died at his residence near Johnstown, Tryon (now Fulton) co., N. Y., July 11, 1774. He was a younger son of Christopher Johnson, an Irish gentleman of good family. Educated with a view to a mercantile life, his career was entirely changed by the refusal of his parents to permit him to marry a lady with whom he had fallen in love. His uncle, Admiral Sir Peter Warren, had married a daughter of Étienne De Lancey of New York, and received with her a large landed estate in that colony, which he increased by purchase, chiefly in the valley of the Mohawk, then a perfect wilderness. Sir Peter offered his nephew the management of his entire property in New York, if he would undertake its improvement and settlement. Johnson accepted the offer, and in 1738 established himself upon a tract of land on the south side of the Mohawk, about 24 miles from Schenectady, which Sir Peter had called Warrensburgh. In addition to the settling and improving of the country, he embarked in trade with the Indians, whom he always treated with perfect honesty and justice. He would never deal with them when they were under the influence of liquor, nor yield to them any thing when he had once refused. This course, added to his easy but dignified and affable manner, and the intimacy which he cultivated with them, by accommodating himself to their manners, and sometimes even to their dress, soon won for him their entire confidence, so that he acquired an influence over them greater than was ever possessed by any other white man. He became a master of their language, speaking many of their dialects as perfectly as they did themselves, and was thoroughly acquainted with their peculiar habits, beliefs, and customs. He was adopted by the Mohawks as one of their own tribe, chosen a sachem, and named Wariaghejaghe, or Warraghiaghy, "he who has charge of affairs." The mismanagement of the commissioners to whom the Indian affairs of the province had been committed, and who were always citizens and traders of Albany, led to the suppression of the commission at the outbreak of the French war in 1748, and the appointment of Johnson as sole superintendent of the Indians; and though he narrowly escaped assassination by the French on more than one occasion, he preserved the

entire western frontier of the colony from injury until the conclusion of the peace of Aix la Chapelle in 1748. In 1750 he was appointed a member of the provincial council. The revival of the Albany board of commissioners in 1753, after his resignation of his office at the conclusion of the war, led to a quarrel between the colonists and the Indians, and the council and assembly urged Col. Johnson to effect a reconciliation. The governor having granted him a new commission, July 5, 1753, he proceeded to Onondaga, held a council, and succeeded in settling the difficulty, but declined having any thing further to do with Indian affairs. He lived at this period at Fort Johnson, a large stone dwelling which he had erected upon the north side of the Mohawk river, directly opposite to Warrensburgh, and which he had fortified in 1743 at the commencement of the old French war. It is now (1860) standing in good preservation, about three miles west of the present village of Amsterdam. In 1754 he attended as one of the delegates from New York the celebrated congress of Albany, and also the great council held with the Indians on that occasion, at which they strongly urged his reappointment as their superintendent. At the council of Alexandria, April 14, 1755, he was sent for by Braddock and commissioned by him "sole superintendent of the affairs of the Six United Nations, their allies and dependants." He was also, pursuant to the determination of that council, created a major-general, and commander-in-chief of the provincial forces destined for the expedition against Crown Point. At the head of these forces, in Sept. 1755, he defeated Baron Dieskau at Lake George, and destroyed his army. Johnson was wounded in the hip, but remained on the field of battle. This victory not only saved the colony from the ravages of the French, but prevented their making any attack upon Oswego, and went far to counteract Braddock's disastrous defeat on the Monongahela in the preceding July. Gen. Johnson received the thanks of parliament for his victory, was voted £5,000, and on Nov. 27, 1755, was created a baronet of Great Britain. It was on his arrival at Lake St. Sacrement a few days before this battle, that he gave to it the name of Lake George, "not only in honor of his majesty, but to assert his undoubted dominion here." In March, 1756, he received from George II. a commission as "colonel, agent, and sole superintendent of the affairs of the Six Nations, and other northern Indians," with a salary of £800, paid by the mother country. He held this office for the rest of his life. In 1756 and 1757 he was engaged with his Indians in the abortive attempts of the British commanders to relieve Oswego and Fort William Henry; and in 1758 was present with Abercrombie at the repulse of Ticonderoga. Gen. Prideaux led the expedition against Fort Niagara in 1759. Sir William Johnson was second in command, and upon the death of Prideaux, before that fort, succeeded to the com-

mand in chief. With upward of 1,000 Indian allies he continued the siege with great vigor, cut to pieces the French army sent to its relief after a sanguinary combat, and then summoned the garrison, which surrendered at discretion. He led the same Indian allies the following year in the Canadian expedition of Amherst, and was present at the capitulation of Montreal and the surrender of Canada to the British arms in 1760. The war was now at an end, and the king granted to Sir William for his services a tract of 100,000 acres of land, north of the Mohawk, long known as "Kingsland," or the "Royal Grant." In 1764, the country being at peace, and the Indians perfectly contented, Sir William erected Johnson hall, the large wooden edifice still standing near the village of Johnstown, a few miles north of Fort Johnson. The laying out of the village of Johnstown, and the building of stores, an inn, a court house, and an Episcopal church, soon followed. Numerous settlers were brought in, the surrounding country was improved, and in three years Johnstown became a thriving village, and in 1772 the shire town of Tryon co. He bestowed great attention upon agriculture, and was the first who introduced sheep and blood horses into the valley of the Mohawk. He lived in the style of an old English baron of former days, and exercised the most unbounded hospitality. He married Catharine Wisenburgh, a German girl, about 1740, who died young, leaving him a widower with three children, a son, John, knighted in 1765, and two daughters, who married respectively Col. Claus and Col. Guy Johnson. Sir William never married again. He had for some years many mistresses, both Indian and white; and one of his earlier ones, also a German, has been the probable cause, from having been confounded with his wife, of the erroneous statement that none of his children were legitimate. He finally selected from among the Mohawks Mary, or as she is generally called "Molly" Brant, the sister of Thayendane-ga or Joseph Brant, the great Mohawk sachem, whom he took to his house and with whom he lived happily till his death. They were never legally married, though such a statement has been made. He had 8 children by her, whom he provided for by his will, in which he calls them his natural children, and he also provided for their mother by the same instrument. He died suddenly after making a long speech at an Indian council at Johnson hall. His death has been ascribed to poison, administered by his own hand, to avoid being compelled to take part either against the colonies or against the king. But his health had been failing for several years, and the testimony of eye-witnesses, and the official documents connected with the event, recently given to the world in the "Colonial History of New York," leave no doubt that it was owing to natural causes entirely.—SIR JOHN, son of the preceding, born in 1742, died in Montreal, Canada, Jan. 4, 1830. He succeeded to his father's title in 1774, and was at

the same time appointed a major-general in the British service. In the revolutionary war he remained loyal to the crown, and used his influence with the Indians to inflict frequent injuries upon the frontier settlements of New York, in retaliation for the sequestration of his large estates in the Mohawk valley. He was governor of Upper Canada for several years subsequent to 1796.

JOHNSON, WILLIAM, an associate judge of the supreme court of the United States, born in Charleston, S. C., Dec. 27, 1771, died in New York, Aug. 4, 1834. His father was a merchant, and prominent in the movements of the revolution in his native state. The family, of English descent, had adopted the name of Jansen instead of Johnson in Holland, and continued to bear it for a time in the new world. He was educated at Princeton college, under the presidency of Dr. Witherspoon, and was graduated in 1790 with the highest honor. Returning to Charleston, he began the study of law under the guidance of O. O. Pinckney, was admitted to the bar in 1792, and soon became distinguished in his profession. In 1794 he was elected to the state legislature, and was twice reelected, being during his last term speaker of the house. It was chiefly by his efforts that the office of comptroller-general was instituted. He investigated the irregular and arbitrary proceedings of the county courts, and when they were superseded by the present circuit courts he was elected one of the judges of the new establishment. When Jefferson was elevated to the presidency, Johnson was made one of the judges of the federal court, with the local jurisdiction of South Carolina and Georgia. Coming into possession of the papers of the revolutionary general Nathanael Greene, he prepared at the request of the family an elaborate work entitled "Sketches of the Life and Correspondence," &c. (2 vols. 4to., Charleston, 1822). The work included a preliminary survey of the causes of the revolution and the state of parties, and especially a comprehensive and authoritative review of the proprietary and colonial history of South Carolina, displaying not only thorough historical research, but a keen and sagacious critical judgment. His numerous episodic disquisitions, however, render the task of following the events of the biography tedious and laborious. A certain national or federal bias also, a proclivity toward a decided centralism, was thought to lead him occasionally to ignore the rights of the states; yet he was always a consistent member of what was called the republican party. His position as a judicial officer of the United States operated to prevent his participation in the controversy between South Carolina and the federal government (1830-'32), but he was keenly alive to its issues and greatly excited in its progress, and forbore only with great effort from engaging in the discussion. He submitted to a surgical operation in New York, under which he died. He was married early in life to Sarah, eldest daughter of Thom-

as Bennett, at one time governor of South Carolina.—JOSEPH, brother of the preceding, an American physician, politician, and man of letters, born in Charleston, S. C., June 15, 1776. After the surrender of Charleston to the British in 1780, he shared the exile of his mother, who with many other non-combatant Carolinians took refuge in Pennsylvania. His father was one of the prisoners of war on parole, who in violation of the terms of capitulation were consigned to a prison ship and finally transferred to St. Augustine. Joseph returned with his family after the close of the war to Charleston, where he received his education. In 1793 he began the study of medicine under Dr. Elisha Poinsett, and subsequently attended the lectures in the university of Pennsylvania, applying himself especially to chemistry and botany. He was graduated there in 1797, defending an experimental thesis on carbonic acid gas. He immediately began the practice of medicine in Charleston in connection with Dr. Poinsett. In 1818 he retired from his profession in order to take charge of the branch bank of the United States at Charleston, of which he was made president, and retained that office till the discontinuance of the bank in 1835. During this period he was prominent also as a citizen and man of letters, eagerly devoting himself to public services in the cause of literature and education, and taking an active part in the exciting political struggles. For many years he was commissioner of the public schools; has been president of the apprentices' library association from its establishment in 1836; and has been for more than 60 years a member of the South Carolinian society, and for 20 years its presiding officer. He was elected a member of the medical society of South Carolina in 1797, and its president in 1807; and he was one of the most efficient collaborators of the literary and philosophical society. In these several causes he has published numerous essays, treatises, and orations. For a long period he was mayor of Charleston, serving without fee or salary. He was one of the active leaders of the union party in the nullification controversy. His most important and best known publication is entitled "Traditions and Reminiscences of the Revolution" (Charleston, 1851), in which he gives, in an easy, unpretending style, his own recollections and accumulations concerning the revolutionary actors, chiefly in the South.

JOHNSON, WILLIAM BULLIEN, D.D., an American clergyman, born on John's island, near Charleston, S. C., June 13, 1782. On leaving school he studied law. In 1804 he joined the Beaufort Baptist church, was ordained in Jan. 1806, and became pastor of the Eutaw Baptist church, one of the oldest in the state. In 1809 he settled in Columbia, where he built a house of worship and organized a church. He held for a few years a pastoral charge in Savannah, Ga.; but a change of health induced his return to Columbia in 1816. In 1822 he took charge of the female academy at Green-

vile, S. C., and, after remaining there 8 or 9 years, resided about 20 years at Edgefield, S. C., in ministerial labor, and a large part of the time teaching a female high school. He subsequently spent a few years in Anderson, S. C., where a flourishing female university is named in honor of him. He has again fixed his abode at Greenville, preaching occasionally, and still cherishing an active interest in educational and religious enterprises. His industrious and systematic habits and a good constitution have preserved the brightness of his faculties at the age of 78. The degree of D.D. was conferred on him by Brown university in 1883. His publications consist of a few sermons, circulars, addresses of the Baptist state convention of South Carolina, a series of articles on justification, a small work on the "Development of the Gospel of Jesus Christ through the Government and Order of the Churches," and a series of articles in the "Southern Baptist," in which the same subject is more fully treated. He wrote in 1886 in favor of revising the English Bible, and is now a life member of the Bible revision society. He was one of the presidents of the general Baptist convention of the United States formed in 1814, and amicably divided into northern and southern organizations in 1845. He was the first president of the latter. For 27 years he presided over the Baptist convention of South Carolina.

JOHNSTON, a central co. of N. C., drained by Neuse and Little rivers; area, 660 sq. m.; pop. in 1860, 13,726, of whom 4,663 were slaves. It has a diversified surface, and contains iron ore and granite. The productions in 1860 were 451,528 bushels of Indian corn, 5,354 of wheat, 197,298 of potatoes, and 758 bales of cotton. There were 5 grist mills, 6 saw mills, 6 newspaper offices, 19 churches, and 1,086 pupils attending public schools. Capital, Smithfield. The N. Carolina railroad traverses the county.

JOHNSTON, ALBERT SIDNEY, an American soldier, born in Mason co., Ky., in 1808. He was graduated at the West Point academy in 1826 as lieutenant in the 6th infantry, and after serving in the Black Hawk war left the army, and in 1836 emigrated to Texas, arriving there shortly after the battle of San Jacinto. He entered the Texan army as a private soldier, and was soon promoted to succeed Gen. Felix Houston in the chief command—an event which led to a duel between them, in which Johnston was wounded. Having held the office of senior brigadier-general until 1838, he was appointed secretary of war, and in 1839 organized an expedition against the Cherokees, who were totally routed in an engagement on the river Neches. In 1840 he retired from office and settled upon a plantation in Brazoria co. He was an ardent advocate for the annexation of Texas to the United States. In 1846, at the request of Gen. Taylor, he took the field against Mexico as commander of a volunteer Texan rifle regiment, in which capacity he served 6 months. Subsequently he was acting inspector-general to Gen. Butler, and for his services at the siege

of Monterey received the thanks of his commander. In Oct. 1849, he was appointed paymaster by President Taylor, with the rank of major; and upon the passage of the act of congress authorizing the raising of additional regiments in the army, he was appointed colonel of the 2d cavalry. In the latter part of 1857 he received the command of the U. S. forces sent to coerce the Mormons into obedience to the federal authority, and conducted the expedition in safety to Great Salt Lake City in the spring of the succeeding year. He has since then commanded the military district of Utah, and has received the brevet rank of brigadier-general.

JOHNSTON, ALEXANDER KEITH, a Scottish geographer, born in Kirkhill, Mid-Lothian, Dec. 28, 1804. He was educated in Edinburgh, and then apprenticed to an engraver, but soon manifested a decided taste for the study of geography. That he might be able to consult the highest geographical authorities in the original, he made himself master of the French, Italian, Spanish, and German languages. His first important work was the "National Atlas" (1843), which procured his election to the royal geographical society, and his appointment to the office of geographer to the queen for Scotland. In 1848 his "Physical Atlas" was published, and immediately after its appearance Mr. Johnston was chosen member of the *Gesellschaft für Erd-Kunde* of Berlin, of the geographical society of Paris, and of the geological society of London. His other principal works are: a "Dictionary of Geography" (2d ed. 1855); a "Geological Map of Europe," in the preparation of which he was aided by Sir R. I. Murchison and Prof. Nichol; "Atlas of North America" (1858); and "Military Atlas to Alison's Europe," and he is now bringing out (1860) the "Royal Atlas of Modern Geography," in 10 parts.

JOHNSTON, ARTHUR, a Scottish physician and Latin poet, born at Oaskieben, near Aberdeen, in 1587, died in Oxford in 1641. After studying at the university of Aberdeen, he went to Padua, where he completed his education in 1610. He then travelled for some time in southern and central Europe, and resided for 20 years in France. About 1635 he returned to Scotland, and was appointed physician to Charles I. In 1637 he became principal of the university of Aberdeen, but his duties as royal physician requiring his residence at court, the greater part of his subsequent life was passed in England. His principal productions are his *Parerga et Epigrammata* (Aberdeen, 1632); *Cantici Solomonis Paraphrasis Poetica* (London, 1633); and *Paraphrasis Poetica Psalmorum Davidis* (Aberdeen, 1637).

JOHNSTON, GABRIEL, a colonial governor of South Carolina, born in Scotland about the end of the 17th century, died in 1752. Very little is known of his personal history. He was educated at the university of St. Andrew's, with a view to the medical profession, which he seems not to have practised. He was for a while professor of oriental languages at St. An-

drew's, and then removed to London, where he was engaged with Pulteney and Bolingbroke in writing for the "Craftsman." By the influence of the earl of Wilmington he was appointed governor of North Carolina, and took the oaths of office at Brunswick, Nov. 2, 1784. He was the ablest and most successful of all the colonial governors, holding the reins of power up to the time of his death.—SAMUEL, an American lawyer and statesman, nephew of the preceding, born in Dundee, Scotland, Dec. 15, 1783, died near Edenton, N. C., in 1816. His father, John, came to North Carolina in 1786, became surveyor-general, and acquired large landed estates. The son chose the profession of the law, and was clerk of the superior court in Chowan co. for 5 years from 1767, and served there also as naval officer under the crown. He soon became prominent both as a lawyer and as a politician. He was elected to the assembly in 1769, when the province was much disturbed by matters connected with the war of the regulation. From the first he espoused the popular side, and was especially conspicuous in the opposition to Gov. Martin. In 1773 the assembly placed him on its standing committee of inquiry and correspondence, the organ by which it sought to coöperate with the other provinces. This was the first decisive step toward revolution taken by the legislature of North Carolina. He was an active member of the first two provincial congresses in this province. The 3d and 4th met at his summons, and he presided over the deliberations of both. In the 3d, Aug. 1775, the political organization of the province was decided on, and the supreme executive authority was intrusted to a provincial council, of which he was made the chairman, and so virtually the governor of the province. In Sept. 1775, he was chosen treasurer for the N. district of North Carolina. The 4th provincial congress made him chairman of the committee to prepare a permanent constitution for the future state. As the committee could not agree, another congress was called at Halifax, Nov. 12, 1776, for this special purpose, and to organize the government thereupon. To this congress Mr. Johnston was not elected. Parties were now definitely formed, and he was charged with leanings toward aristocracy; and it is said that the whole force of the radical party was directed to the single object of defeating him. In 1781-2 he was a member of the continental congress. In 1787 he was elected governor of the state, and in 1788 presided over the convention which rejected the federal constitution, which, however, he supported with all his influence. In 1789 he presided over the convention which adopted the federal constitution. He was the 1st U. S. senator from North Carolina, and held that office from 1789 to 1793. In Feb. 1800, he was appointed judge of the superior court, which post he resigned in 1808.

JOHNSTON, GEORGE, a Scottish naturalist, born in 1798, died at Berwick-on-Tweed, July 8, 1855. After serving a medical apprenticeship

with Dr. Abercrombie of Edinburgh, he entered the university of that city, where he was graduated in 1819. Subsequently he settled as a medical practitioner at Berwick-on-Tweed. Amid many arduous professional duties, he cultivated natural history with an enthusiasm and a success which rendered the place of his residence "one of the most classic localities in Great Britain." Apart from numerous papers contributed to the "Edinburgh Philosophical Journal" and other scientific periodicals, he published two works of first-rate importance: "History of British Zoophytes" (2d ed., 2 vols. 8vo., London, 1847), and "History of British Sponges and Lithophytes" (8vo., 1842). In 1850 appeared his "Introduction to Conchology," with an abundance of illustrations. His latest work was "The Natural History of the Eastern Borders" (vol. i., "Botany," 8vo., 1854), and he was engaged at the time of his death upon a complete work on British annelids. He is considered one of the most accomplished contributors to the literature of natural history, and was one of the founders of the Ray society.

JOHNSTON, JAMES F. W., a Scottish chemist and agricultural writer, born in Paisley about 1796, died in Durham, England, Sept. 18, 1855. When a young man he supported himself by preparing students for the Glasgow university, and in 1825 he established a school at Durham. In 1830 he married, gave up his seminary, and, repairing to Sweden, became a pupil of Berzelius. On his return he settled in Edinburgh, and was appointed chemist to the agricultural society of Scotland, filling at the same time the office of lecturer on chemistry and mineralogy in the university of Durham. After the dissolution of the society he removed to Durham, and devoted himself chiefly to the composition of works on agricultural chemistry. He subsequently visited the United States and France. His works are: "Elements of Agricultural Chemistry and Geology" (8vo., Edinburgh, 1842); "Suggestions for Experiments in Agriculture" (8vo., 1843); "Catechism of Agricultural Chemistry and Geology" (16mo., 1844; translated and used as a school text book in most countries of Europe and America); "Lectures on Agricultural Chemistry and Geology" (8vo., 1844); "Contributions to Scientific Agriculture" (8vo., 1849); "Treatise on Experimental Agriculture" (8vo., 1849); "Use of Lime in Agriculture" (8vo., 1849); "Notes on North America, Agricultural, Economical, and Social" (2 vols. 8vo., 1851); "Instructions for Analysis of Soils, Limestone, &c." (12mo., 3d ed. 1855); "Chemistry of Common Life" (2 vols. 8vo., 1854-5). Of several of these many editions have been printed both in Great Britain and America.

JOINT STOCK COMPANY. This name usually designates a partnership in which the capital is distributed by shares among a large number of partners. They assume in certain respects a corporate form, but possess legally none of the peculiar attributes or powers of corporations.

Like these, however, they adopt a corporate name; divide a fixed capital into shares, which they make transferable by assignment and delivery; and commit the conduct of their business to a board of directors. It is also sometimes stipulated in the fundamental articles of the association, that no member shall be liable for the company's debts beyond the amount of his shares. So far as the partners alone are concerned, they may adopt what rules they will for the internal administration of the partnership. But their imitation or assumption of corporate powers or responsibilities cannot avail them in law, except so far as recent legislation favors them, or prejudices the rights of third parties. They remain partnerships, and are generally subject to the rules of law which govern partnerships. Thus, such a company cannot sue its shareholders at law for breach of their engagements to it; for as copartners of the plaintiffs, they cannot be made liable, according to the rules of pleading, in such a suit; they must therefore resort to the intervention of trustees in order to avail themselves of contracts made or to be made with their members. They cannot proceed in law or in equity by their corporate name. And they are bound by that familiar rule of partnership law, which no mere mutual agreement can evade, that each member of the association is liable as a partner *in solido*, or to answer, with his whole private property, for all the debts of the partnership. It is doubtful whether this rule would be changed even though the creditor dealing with the company have notice of a stipulation in the articles of association limiting the responsibility of the members to the mere joint funds, or to a qualified extent. In recognition of the advantages secured to the community by the combination of capital in the prosecution of important enterprises, and in view of the embarrassments to which they are subjected by the operation of the rules of law, joint stock companies have received both in England and in the United States some assistance from legislation. In England, the statute 7 and 8 Victoria, c. 110, conferred upon them a qualified corporate character. They thus acquired a separate legal assistance apart from that of their individual members, and became bodies corporate for the purposes of carrying on their business, of taking and holding a common property, and of suing and being sued. The statute of New York which controls these associations is of a somewhat similar character. Neither of these acts, however, exempts the members from their ordinary partnership liability for the whole debts of the company; though the English act provides that the common property shall be first applied to the satisfaction of such debts. In Massachusetts and some other states, joint stock companies, in common with other trading associations, which possess the required capital and embrace a prescribed number of members, and in other respects conform to the conditions of the statute, may become corporations, with all their characteristic pow-

ers, privileges, and incidents. Thus, in fact, they cease to be partnerships or joint stock companies, and are brought under the general statute which governs corporations of this kind.

JOINT TENANTS, persons to whom a single estate is granted jointly by the same deed or will, and without any exclusive restrictions or explanatory words. The grant can take effect in such a case only by considering that all the grantees have equal interests, and that each has the entire possession of the whole estate. For between the grantees there is a unity: 1, of title, the estate being derived from one and the same conveyance; 2, of time, for it was created and vested in them at the same period; 3, in respect to interest, for it is a single estate which was conveyed; 4, in respect to possession, for the estate is to be enjoyed in common during the same time. It was the distinguishing incident of joint tenancies that, upon the death of his co-grantees, the estate passed undiminished to the last survivor. This is the so called *jus accrescendi*, or right of survivorship. It originated in the feudal law, the policy of which was averse to the division of tenures, and to the distribution of the feudal services among tenants who might be strangers to the lord. The rules of law in relation to joint tenancies were strictly upheld for a long time by the courts of common law, but were regarded with less favor in proportion as the law of tenancies was modified. Joint tenancies, with all their incidents, have been but little recognized in the United States; and the incident of survivorship is very generally abolished. It is the rule in most states, that all estates conveyed to two or more persons are to be deemed tenancies in common, unless a different tenure is clearly expressed or implied in the instrument creating the estate. And even a joint tenant may usually transfer his share, and the transferee will hold it as a tenant in common. A proper exception is made in the cases of estates vested in trustees or executors, as such, who are still joint tenants, because the proper execution of the trust requires the right of survivorship. By the law of joint tenancy, the possession and control of the property remain with the survivors, instead of passing to the representatives of a deceased trustee. Nor can a trustee, by his mere assignment, put another person in his place, and confer upon him his powers. (See TRUSTS.)

JOINVILLE, JEAN, sire de, a French chronicler, born at the chateau of Joinville in Champagne in 1224, died in 1319. Belonging to a noble family, he early entered the service of Thibaut IV., king of Navarre, the most renowned trouvère of his time, and in a few years he assumed the hereditary office of seneschal. In 1248 he obeyed the summons of Louis IX. of France, took the cross, and enlisted 3 bannerets, 6 knights bachelor, and 700 men-at-arms, with whom he sailed from Marseilles and joined the king in Cyprus. During the winter of 1249-'50, which the crusaders spent there, the seneschal had frequent intercourse with the king,

from which sprang a deep and mutual affection. Joinville was in the first rank when the French army effected its landing at Damietta, in Egypt, on Easter Monday, 1250; and at the head of his men he kept at bay a body of 6,000 Saracens. He fought at the disastrous battle of Mansoorah, was taken prisoner with the king in his retreat toward the sea, barely escaped death, and was finally liberated with his master. He accompanied Louis to Palestine, where they sojourned nearly 4 years. He returned home in 1254, and still maintained his personal intimacy with the king; but when, in 1270, Louis IX. summoned his barons to another crusade, Joinville declined to go. However, he bore witness to the king's virtues during the inquest preparatory to canonization, and he gladly assented when Queen Jeanne of Navarre requested him to write the deeds and good sayings of her husband's grandfather. To this request we owe his *Mémoires*, which are invaluable as a chronicle, and unrivalled in point of simplicity and grace. They were completed about 1309, and first printed by Marnef brothers (4to., Poitiers, 1546). The best editions are those of Du Cange (1668), Capperonnier (1761), and F. Michel (Didot, Paris, 1858). Capperonnier's was reprinted in 1840, with annotations, in the *Recueil des historiens de France*, vol. xx.

JOINVILLE, FRANÇOIS FERDINAND PHILIPPE LOUIS MARIE D'ORLÉANS, prince de, the 8d son of Louis Philippe, king of the French, born at the palace of Neuilly, near Paris, Oct. 14, 1818. Like his elder brothers, he completed his classical studies in the college of Henry IV., and then prepared himself for the naval school at Brest, into which he was admitted after passing the usual examination. He submitted to the regular training of the naval profession, went through all the routine of the service, and rapidly acquired considerable proficiency. His birth secured him of course rapid promotion, but there were few if any more meritorious officers in the French navy. He managed to be constantly in active service, evincing in all circumstances the utmost desire to distinguish himself. An opportunity was offered him in 1838, when Admiral Baudin was sent against Mexico. The prince, who had reached the rank of post-captain, was in command of the frigate *Oréole*, and was remarkable for the boldness and precision of his manoeuvres during the bombardment of the castle of San Juan d'Ulloa. A few days later, at the head of a detachment of sailors, he landed near Vera Cruz, broke in the gate of the city, passed through the streets amid brisk discharges of musketry, and with his own hand took Gen. Arista prisoner. His brilliant conduct was rewarded by the cross of the legion of honor, and his promotion to the rank of full captain. In 1840 he was sent to St. Helena, with two frigates, the *Belle Poule* and *Favorite*, to receive the remains of Napoleon I., which were transported to France. After a visit to the United States, and a cruise along the coast of Africa, he repaired to Rio Janeiro, which he had al-

ready visited, and there, May 1, 1843, married the princess Francesca of Braganza, the sister of Don Pedro II. In the same year he was appointed rear admiral, and became a member of the admiralty board; he participated in the deliberations of the committee for the organization of a steam navy, insisted upon the necessity of taking active measures toward this end, published in the *Revue des deux mondes* an able paper, *Note sur les forces navales de la France*, which attracted public attention to the subject, and saw his exertions crowned with partial success. In 1844 he was placed in command of the French fleet cruising along the coast of Morocco, and while Marshal Bugeaud was invading that empire by land, he bombarded Tangier, Aug. 6, and Mogadore, Aug. 15, taking possession of the island and harbor, and obliged the Moors to come to terms. The prince, who entertained liberal opinions, had more than once warned his father of the dangers attending his retrograde policy; but his voice had been powerless. On the breaking out of the revolution of 1848, he was in Algeria; he resigned his command to republican officers, sailed for England, and joined his exiled family at Claremont. When the constituent assembly discussed the decree of banishment against the Orleans family, he sent in a protest couched in most dignified terms. Since that time he has lived in retirement, keeping carefully aloof from all political intrigues, devoting his leisure hours to the education of his children and the colonization of his vast possessions in Brazil. The domain in France which he inherited from his aunt Adelaide was confiscated by Louis Napoleon in 1852. He has published in pamphlet form an *Étude sur l'esquadr de la Méditerranée* (1852), and *La guerre de Chine en 1857*, in the *Revue des deux mondes*.

JOKJOKARTA, DJOCJOCARTA, OJOJOOKARTA, or YUGYAKARTA, a maritime province or residency in the S. part of Java, formerly one of the most important native states on the island, but now subject to the Dutch; pop. 380,000. It contains the volcano of Nerapi, 3,150 feet high, abounds in teak, is very fertile, and produces rice, coffee, and tobacco, but has no good harbors.—JOKJOKARTA, the capital of the above residency and seat of a native sultan and a Dutch resident; pop. 90,000. The most interesting features of the town are said to be the native monarch's water palace, with its walls, towers, and subterraneous approaches, and the fort occupied by Europeans. The sultan is attended by a body guard of young females, armed with lance, sword, and pistol, and serving both as infantry and cavalry. From them are often chosen inmates for the royal harem.

JOLIBA. See NIGER.

JOLIET, a city of Illinois, capital of Will co., situated on both sides of the Des Plaines river, 40 m. S. W. from Chicago; pop. in 1850, 2,659; in 1855, 6,000; in 1858, about 8,000. The Illinois and Michigan canal passes through the city, and it is the point of junction of the Chicago and Rock Island with the Chicago, Alton,

and St. Louis, the northern Indiana and Joliet, and the Joliet and Mendota railroads. It is surrounded by a rich agricultural country, and is the principal shipping point for the produce of this region which is exported by canal. In 1858 it contained 6 churches, 2 handsome school houses, a bank, 8 hotels, 2 flour mills, a saw mill, and several large timber yards. It is well built and lighted with gas. The city hall is a large and imposing edifice. The new state prison near Joliet is a massive stone structure, occupying an area of 15 acres. It was expected to be completed in the spring of 1860, and was already so far finished in May, 1858, that a number of prisoners were removed to it from the old penitentiary at Alton. There are inexhaustible quarries of fine blue and white building stone near the city.

JOLLIET, or JOLIET, LOUIS, one of the discoverers of the Mississippi river, born in Quebec, probably in the first half of the 17th century, died about 1730. He was educated at the Jesuit college of Quebec, and subsequently engaged in the fur trade on the western frontier, thereby becoming familiar with the missionaries, and with the habits and languages of various Indian tribes. Such was his reputation for prudence and experience that he was selected by the governor Frontenac and the intendant Talon to ascertain the direction and mouth of the Mississippi, a few of whose affluents had already been visited by missionaries and traders. Starting with his companion, the illustrious Father Marquette, and 5 other Frenchmen, from Green Bay in June, 1673, he ascended the Fox river, and descended the Wisconsin to its confluence with the Mississippi, down which the party sailed as far as the country of the Chickasaws, below the entrance of the Arkansas. Having ascertained with tolerable accuracy the general course of the stream, they returned to Green Bay, by the way of the Illinois river, Chicago, and Lake Michigan, whence Jolliet started alone for Quebec. The whole route travelled by them is estimated at 2,500 miles. He lost his journal and other papers in the rapids above Montreal, but wrote out from recollection a few pages of manuscript, which agree with the narrative of Marquette. In the same manner he prepared a map of the region explored. The French government inadequately rewarded him for his services with the island of Anticosti at the mouth of the St. Lawrence, where he built a house and fort for his family, intending to embark in trade. He appears, however, to have been subsequently employed in the west. In 1691 his island was captured by a British fleet and his property destroyed. Of his subsequent history very little is known. Joliet, the capital of Will co., Ill., is named after him.

JOMARD, EDMÉ FRANÇOIS, a French geographer and archæologist, born in Versailles, Nov. 20, 1777. After completing his studies at the polytechnic school, he was appointed a member of the scientific commission which accompanied Bonaparte to Egypt in 1798, and

distinguished himself there by his zeal and successful researches. On his return to France, he was sent on a topographical mission to the Upper Palatinate, but was soon recalled to Paris in order to take part in the preparation of the *Description de l'Égypte*. Appointed secretary of the commission, and especially charged in 1807 to superintend the engraving and printing of that publication, he devoted 18 years to its completion. In order to procure some additional materials for it, he repaired to England in 1814, where, with the aid of Sir Joseph Banks, he was enabled to execute his design. During this journey he was impressed with the excellence of the Lancasterian schools, and on his return introduced the system into France. Meanwhile he was a zealous promoter of the cause of geographical science, inducing the government to send travellers to various parts of the world, giving accounts of their discoveries in his interesting papers, and participating in 1821 in the establishment of the geographical society. In 1828, on the organization of the new department of geography and travels in the royal (now imperial) library, he received the appointment of *conservateur administrateur*. He was made an officer of the legion of honor in 1833. Being held in great esteem by Mehemet Ali, he persuaded the pasha to send a number of young Egyptians to study in Paris. These young men formed what was called the *institut des Égyptiens*, placed under the direction of Jomard. As a reward for his services, the successor of Mehemet Ali appointed him his scientific correspondent, and granted him the honorary title of bey. His numerous publications are all devoted to geography, archæology, or public education. Beside his contributions to the great work of the Egyptian commission, which he has printed separately, under the title of *Recueil d'observations et de mémoires sur l'Égypte ancienne et moderne* (4 vols. 8vo., Paris, 1830), his most important publications are: *Voyage à l'oasis de Syouah* (1819), from the notes of the travellers Caillaud and Drovetti; *Remarques sur les rapports de l'Éthiopie et de l'Égypte, &c.* (1822-'3); and *Aperçus et coups d'œil sur les nouvelles découvertes dans l'Afrique centrale* (1824-'7). Nearly all of these are accompanied with valuable maps and diagrams.

JOMELLI, NICOLÒ, an Italian composer, born in Aversa, near Naples, in 1714, died in Naples, Aug. 28, 1774. He was a pupil of Leonardo Leo. His *Errore amoroso* and *Odoardo*, produced in Naples before he was 24 years of age, established his reputation, and he was invited to Rome, where he composed two new operas. Thence he went to Bologna, where he studied under Padre Martini. After a successful career in the chief cities of Italy, he returned in 1749 to Rome, where his *Artaserse* was coldly received, it being supposed that he was aspiring to the situation of chapelmaster of St. Peter's, for which neither his years nor his education qualified him. He was induced by this discomfiture to apply himself assiduously to the study

of the more profound branches of his art, especially ecclesiastical composition. At Vienna the next year, he produced his *Achille in Sciro* with complete success. Here too he made a congenial friend in the poet Metastasio, whose *Didone* he set to music, and on whose works he thenceforth almost exclusively employed himself. Returning to Rome in 1751, he received the coveted appointment of chapelmaster, which however he resigned in 1753 to accept an invitation from the duke of Württemberg to settle as musical director in Stuttgart. After many years' absence he returned to Naples in 1768; but his style no longer pleased the Neapolitans, and upon the failure of his *Demofoonte* and *Iphigenia in Aulide* he sickened and died, having first composed his *Miserere*, the last and greatest of his works.

JOMINI, HENRI, baron, a French military historian, born in Payerne, canton of Vaud, Switzerland, March 6, 1779. He served first in the troops of his native country, and in 1804 was admitted to the French army with the rank of major, and was soon promoted to a colonelcy. Being attached to Marshal Ney in the capacity first of aide-de-camp, then of chief staff officer, he accompanied him to Germany in 1805-'7, and to Spain in 1808. Meanwhile he employed his pen in several political and military essays; as early as 1805 he had presented to Napoleon the first edition of one of his chief works, *Traité des grandes opérations militaires, ou histoire critique et militaire des guerres de Frédéric II. comparées à celles de la révolution* (5 vols. 8vo., with an atlas, Paris, 1805). Some misunderstanding between him and his commander caused him to be dismissed from his post, and he then offered his services to Alexander of Russia; but Napoleon would not allow him to throw off his allegiance. Clarke, the minister of war, offered him the alternatives of imprisonment or the rank of brigadier-general, and he reluctantly accepted the latter. In 1812 he was appointed governor of Wilna and then of Smolensk, and was of great service to the French army during the latter part of the disastrous retreat from Moscow. He subsequently resumed his duties as chief staff officer of Marshal Ney, and participated in the victory of Bautzen. Ney asked for him the rank of general of division; but not only was this recommendation overlooked by Berthier, who was unfriendly to him, but his name was erased from the promotion list and he was put under arrest on account of some trifling irregularities in his routine duties. This treatment he deeply resented; and after the armistice of Pläswitz, he left the French army and repaired to the head-quarters of Alexander, who appointed him his aide-de-camp. Sentence of death was passed against him as a deserter by a French court martial, and it was rumored that he had betrayed the military plans of the French to their enemies; but such an accusation was wholly unfounded, as was afterward ascertained by Napoleon's own declaration. Jomini even declined taking an active part in

the operations of the allied armies against France. In 1815 he accompanied the czar to Paris, and received the cross of the order of St. Louis from Louis XVIII. He tried, but in vain, to save the life of Marshal Ney. After sojourning in France to superintend the publication of his great work, *Histoire critique et militaire des campagnes de la révolution de 1792 à 1801*, written in conjunction with Col. Koch (15 vols. 8vo., Paris, 1819-'24), he returned to Russia in 1822, and was intrusted with the completion of the military education of the grand duke Nicholas, who, on his accession to the throne, retained him as his aide-de-camp. He served in 1828 during the Russian war against Turkey, and organized in 1830 the Russian military academy. He then retired to Brussels, but hastened to St. Petersburg on the breaking out of the Crimean war. Since 1855 he has again resided in Brussels. Beside the above mentioned works, which are the basis of his reputation as a military writer, his chief publications are: *Principes de la stratégie* (3 vols. 8vo., Paris, 1818); *Vie politique et militaire de Napoléon, racontée par lui-même au tribunal de César, d'Alexandre et de Frédéric* (4 vols. 8vo., Paris, 1827); *Tableau analytique des principales combinaisons de la guerre et de leurs rapports avec la politique des états* (4th ed., St. Petersburg, 1836); *Précis de l'art de la guerre, ou nouveau tableau analytique des principales combinaisons de la stratégie, de la grande tactique et de la politique militaire* (6th ed., Paris, 1838); *Précis politique et militaire de la campagne de 1815* (Paris, 1839); *Appendice au précis de l'histoire de la guerre* (Paris, 1849).

JOMSBORG, a piratical city, once existing on the S. coast of the Baltic, but of which no traces now remain. Its exact situation is not known. It became probably identical with Julin, a seaport founded by the Wends, and situated in that part of the delta of the Oder which is now the island of Wollin, described by Adam of Bremen as the largest and most flourishing commercial city in Europe in the 11th century. M. Mallet calls this city both Julin and Jomsborg. The Scandinavian pirate Palnatoki, about the middle of the 10th century, erected a stronghold near Julin, and ultimately obtained possession of the whole island, thus giving the name Jomsborg to what had been Julin. Contempt of death, and fearlessness in general, were the requirements for admission into the community of Jomsborg; and every aspirant underwent some trials in this respect. Jomsborg was destroyed about 1175, by Waldemar the Great of Denmark, in alliance with the princes of Germany and the emperor Barbarossa. The remnant of the pirates escaped to Pomerania, and established themselves upon the Elbe, until they received their final blow from the Danes during the reign of Canute VI. a few years after the destruction of their great depot.

JONAH, the 5th of the minor Hebrew prophets, son of Amittai, born in Gath-hepher, in the tribe of Zebulon, prophesied in the kingdom of

Israel under Jeroboam II. In the book of Jonah it is related that he received the divine command to go to Nineveh and denounce the wickedness of that city. Refusing to undertake the mission, he embarked at Joppa for Tarshish that he might flee from the presence of the Lord. Overtaken by a tempest, the mariners threw him overboard as the cause of their disaster. He was miraculously preserved, being swallowed by a great fish, within which he lived 3 days and 3 nights, when the monster threw him forth upon dry land. Again sent to Nineveh, he prophesied the destruction of that city within 40 days. The Ninevites repented, and God forbore to execute the sentence which he had pronounced. Jonah complained of this result, retired from the city, and while dwelling in a booth was symbolically reproved by God. The literal interpretation of the book of Jonah was maintained by the early ecclesiastical authors. Various allegorical and mythical interpretations have been advanced by some modern critics, as Semler, Michaelis, Herder, Eichhorn, Meyer, and De Wette.—See Jäger, *Ueber den Zweck des Buches Jonas* (1840), and Krahmer, *Das Buch Jonas historisch-kritisch untersucht* (1846).

JONAS, JUSTUS, a German theologian, born in Nordhausen in 1493, died in Eisfeld in 1555. He studied law and afterward theology at Erfurt, and was appointed in 1521 professor at Wittenberg, where he embraced with zeal the doctrines of the reformation, becoming intimate with Luther and accompanying him to the diet at Worms. He was present at the conference in Marburg and at the famous imperial diet of Augsburg. In 1541 he was appointed preacher at Halle, from which place when banished he accompanied Luther on his last journey to Eisleben. At the time of his death he was pastor and superintendent at Eisfeld. He assisted Luther in translating the Bible. The work by which he is best known is the *Discussio pro Conjugio Sacerdotali* (1528).

JONES, the name of 4 counties in the United States. I. A S. E. co. of N. C., drained by Trent river; area, 880 sq. m.; pop. in 1850, 5,088, of whom 2,757 were slaves. It has a level and marshy surface, with pine and cypress forests, and a sandy soil. The productions in 1850 were 235,362 bushels of Indian corn, 10,385 of oats, and 98 bales of cotton. There were 15 grist mills, 1 saw mill, 12 tar and turpentine manufactories, 18 churches, and 240 pupils attending public schools. Capital, Trenton. II. A central co. of Ga., bounded W. by Ocmulgee river; area, 860 sq. m.; pop. in 1852, 10,056, of whom 8,126 were slaves. The surface is hilly, and the soil generally good, though much worn. Iron, granite, and quartz are found. The productions in 1850 were 402,360 bushels of Indian corn, 54,208 of oats, 84,677 of sweet potatoes, and 9,006 bales of cotton. There were 6 grist mills, 2 saw mills, 16 churches, and 850 pupils attending public schools. Value of land in 1856, \$1,515,306. The central Georgia railroad passes along the S. boundary of the

county. Capital, Clinton. III. A S. E. co. of Miss., drained by Leaf and Tallahoma rivers; area, 672 sq. m.; pop. in 1850, 2,164, of whom 274 were slaves. It has a rolling or slightly hilly surface, with a sandy soil of various qualities. The productions in 1850 were 60,988 bushels of Indian corn, 32,615 of sweet potatoes, 250 bales of cotton, and 74,555 lbs. of rice. There were 2 grist mills, 4 saw mills, 12 churches, and 76 pupils attending public schools. Capital, Ellisville. IV. An E. co. of Iowa, drained by Wapsipinicon and Makoqueta rivers; area, 576 sq. m.; pop. in 1859, 18,475. It has a diversified surface, with alternations of prairie and forest, and a fertile soil resting chiefly on a bed of limestone. The productions in 1859 were 124,405 bushels of wheat, 527,885 of Indian corn, 58,445 of oats, 87,411 of potatoes, 10,678 tons of hay, and 275,600 lbs. of butter. The Dubuque and Pacific railroad passes through the county. Capital, Anamosa.

JONES, ANSON, the last president of the republic of Texas, born in the part of Great Barrington called Seekonk, Berkshire co., Mass., Jan. 20, 1798, died by his own hand in Houston, Texas, Jan. 7, 1858. At the request of his father, a farmer, who had afforded him a fair education, he commenced the study of medicine in Litchfield, Conn., in 1817, and in 1820 was licensed to practise. After a residence in South America, Philadelphia, and New Orleans, without having obtained much success in his profession, he established himself in 1833 in Brazoria, Texas, and immediately entered upon a lucrative practice. Upon the outbreak of the troubles between Texas and Mexico, he became one of the earliest advocates of the severance of the two countries; and in Dec. 1835, as chairman of a large meeting held in Brazoria, drew up resolutions in favor of a "declaration of independence from Mexico," and of a convention of the people of Texas to form a constitution. In the succeeding war of independence he served as a private soldier and as surgeon in the Texan army. In 1837-'8 he was a representative in the Texan congress from Brazoria co., in which capacity he aided in destroying the celebrated monopoly, the "Texan Railroad, Navigation, and Banking Company." In 1838 he was sent as minister to Washington, where he remained about a year, and where he endeavored, though unsuccessfully, to secure the annexation of Texas to the United States. On his return to Texas he took his seat in congress as senator from Brazoria, and in 1841 he was appointed by President Houston his secretary of state, which office he filled 3 years. During this period, and subsequently also, he had the entire direction of the diplomacy of the country, and to his efforts perhaps more than to those of any other individual is due the high position which Texas acquired in her relations with foreign powers. In Sept. 1844, he was elected president of Texas for 8 years from the ensuing December, and held that office until the annexation of Texas to the United States. His ad-

ministration covered a very busy and critical period in the history of Texas, and his labors and responsibilities were greater than had fallen to the lot of any of his predecessors in the same space of time. He succeeded in maintaining a footing of equality in negotiations with England, France, and the United States; and by the intervention of the two former powers the government of Mexico was induced to acknowledge the independence of Texas. Commercial activity was incited, emigration from Europe, and particularly from Germany, was setting in, and terms of great advantage could undoubtedly have been secured to the country by treaties with foreign powers, under a stipulation that annexation to the United States should not be encouraged. Under these circumstances it is believed that President Jones preferred independence to annexation. But when it became evident that the popular will was in favor of the latter measure, he spared no efforts to accomplish it, at the same time that he avoided giving umbrage to the European powers. His popularity, however, was affected by the course he pursued, and he was never afterward elected to any public office of importance, a circumstance which preyed deeply upon him, and probably led to the mental alienation under the influence of which he put an end to his life. He possessed great abilities for public business, especially as a diplomatist, and in private life was remarkable for suavity of manner and strong common sense. The latter years of his life were passed in agricultural pursuits. In 1859 his journal, preceded by a brief autobiography, was printed for private circulation.

JONES, INIGO, an English architect, born in London in 1572, died July 21, 1652. He was of humble origin, and in early life is said to have been apprenticed to a joiner. But manifesting a strong inclination for drawing, he attracted the notice of the earl of Pembroke, who afforded him the means of procuring an art education abroad. During several years he made careful studies of the chief architectural monuments of France, Germany, and Italy; and in the latter country he first obtained a correct idea of the various ancient classic, and of the modern Italian styles, the first of which were altogether unknown in England, while the latter had never been introduced save in fragmentary details. In Venice he became acquainted with the masterpieces of Palladio, whose style he subsequently transplanted into England. At the invitation of Christian IV. of Denmark, he visited Copenhagen in 1604, and during a residence there of about a year furnished, it is said, the designs for the royal residences of Rosenborg and Frederiksborg, which are little creditable to his architectural skill or taste. In 1605 he returned to England, and at the recommendation of Christian, whose sister James I. had married, was kindly received by the latter monarch, who employed him to prepare the scenery, decorations, and machinery for the masques written by Ben Jonson, which were among the

chief amusements of the court. So wholly was his time devoted to this occupation, that for several years he was unable to accomplish any important architectural work. He became a person of considerable consequence, however, at court, and by his overbearing manners incurred the enmity of his dramatic associate, Jonson, who satirized him under the name of Lantern Leather-head in his "Bartholomew Fair." In 1612, upon the death of Prince Henry, to whom he had been appointed architect, he revisited Italy, and succeeded in materially improving his style. Upon his return to England he was made surveyor-general of the royal buildings, and during the next 25 years was occupied with many important public works, holding all the time the position of the first architect of England, if not of his age. His designs for the palace at Whitehall, of which only the banquetting house was built, are considered his *chef d'œuvre*; beside which he designed the river front of Somerset house, a splendid Corinthian portico rather incongruously added to old St. Paul's, the arcade and church of St. Paul, Covent Garden, York stairs, surgeons' hall, Shaftesbury house, Ashburnham house, and many private residences in various parts of England, all of which were much admired in their day, although modern taste finds in such of them as remain little to admire or praise. Jones also aspired to the character of an antiquary, and at the request of James I. made a careful examination of the druidical remains at Stonehenge, which he undertook to show belonged to a temple of the Roman or Tuscan order dedicated to Coelus. The errors of his restoration, as disclosed in his "Essay on Stonehenge," published after his death by his son-in-law John Webb (fol., 1655), are sufficiently apparent, to say nothing of the absurdity of his general conclusions. During the civil wars he adhered to the royal cause, and suffered so much from fines and other persecutions that he died broken-hearted and in poverty. A good idea of his merits as an architect may be derived from the volumes of his designs published by William Kent in 1727 and 1770, and by Isaac Ware in 1743. His reputation is hardly sustained by these, but must be accounted for in a great measure by the novelty of the new classic style he introduced into England, and by the fact that he occupied the field during his whole life with scarcely a rival. He in no respect merits the title of the "English Palladio" or the "English Vitruvius," frequently bestowed upon him. He was an accomplished classical scholar and mathematician, and occasionally wrote verses. His publications consist of a masque and several miscellaneous essays, and he also left some notes on Palladio's architecture, which were inserted by Leoni in an edition of Palladio in 1714.—See "Life of Inigo Jones," by Peter Cunningham (London, 1848).

JONES, JACOB, a commodore in the U. S. navy, born near Smyrna, Kent co., Del., in 1770, died in Philadelphia in Aug. 1850. He was educated for the medical profession, and

commenced practice in his native county, but soon relinquished it for the clerkship of the supreme court of Delaware. In April, 1799, he received a midshipman's warrant in the navy, and served for some time in the frigate *United States* under Commodore John Barry. He was promoted to the rank of lieutenant in Feb. 1801, and at the opening of the war with Tripoli was attached to the frigate *Philadelphia*, in which he was captured off Tripoli in 1808 (see *BAIRBRIDGE, WILLIAM*), and remained a prisoner 20 months. He was afterward employed for some years on the S. coast of the United States, a part of the time in command of the brig *Argus*. In April, 1810, he was commissioned as master commandant, and in 1811 was appointed to the command of the *Wasp*, a sloop of war of 18 guns. He was on his passage home from France in 1812 when war was declared by the United States against England. On his arrival the *Wasp* was ordered to sea again immediately, and sailed from the Delaware on Oct. 18 upon a cruise. On the night of the 17th, in lat. 37° N., long. 60° W., she fell in with a number of vessels, which on the morning of the 18th were discovered to be a convoy of English merchantmen protected by a sloop of war, which the *Wasp* engaged at 11h. 30m. A. M. The action commenced at a distance of 50 or 60 yards, which was gradually lessened for a space of 48 minutes, when the *Wasp* boarded, and carried her antagonist. The fire on both sides was extremely well maintained, but, as the result proved, that of the *Wasp* was the most rapid and accurate. The captured vessel proved to be *H. B. M. sloop Frolic*, Capt. Whinyates, mounting 16 32 lb. carronades, 4 long guns, and 2 12 lb. carronades upon her topgallant forecastle. The armament of the *Wasp* was 16 32 lb. carronades and 2 long 12 lb. guns. The *Wasp* had 138 men upon her muster roll; the *Frolic* probably a few less, though this is not certainly known. The two vessels were very nearly equal, and no action of the war of 1812 was more creditable to the American navy than this. The *Wasp* suffered considerably in her rigging and spars, though but little in her hull; but the *Frolic* was a mere wreck when she surrendered. Her loss was never accurately known, but was probably not less than 80 killed and wounded. Among the wounded were her captain, 1st lieutenant, and master, the two last mortally. Capt. Whinyates stated in his official report, that not 20 of his crew escaped unhurt. Possession was immediately taken of the *Frolic*, and a prize crew placed on board her under the command of Lieut. James Biddle, 1st lieutenant of the *Wasp*, who had hardly commenced clearing the wreck when a large sail was seen standing toward the two vessels. It proved to be *H. B. M. ship Poitiers* of 74 guns, which captured both vessels and carried them to Bermuda. The Americans were soon put on parole, and returned to the United States, Capt. Jones being everywhere received with distinguished honors. Congress voted a gold medal to him, and silver ones to

each commissioned officer of the *Wasp*. In March, 1818, he was promoted to the rank of post-captain, and appointed to the command of the frigate *Macedonian* in the squadron of Commodore Stephen Decatur. After the peace with England, Commodore Jones commanded squadrons in the Mediterranean and Pacific, and served for some years as a commissioner of the navy board, and governor of the naval asylum at Philadelphia.

JONES, JAMES CHAMBERLAIN, an American statesman, born in Davidson co., Tenn., April 20, 1809, died in Memphis, Oct. 29, 1859. During his infancy his father died, and Col. Ward, a prominent politician, became his guardian, and brought him up in his own family. Mr. Jones's advantages of early education were limited; he attended a country school at intervals for 8 years. Being fond of books, and having access to his guardian's library, he acquired the elements of a good English education, and a knowledge of history. A large portion of his time before attaining his majority was devoted to labor on Col. Ward's plantation. At the age of 21, having married and received his small patrimony, he settled on a farm in Wilson co. In 1837 and 1839 he represented that county in the legislature. In 1840 he was a candidate for presidential elector on the Harrison and Tyler ticket. In 1841 he was nominated as the whig candidate for governor of Tennessee against the late James K. Polk. After an animated contest, in which the entire state was canvassed by the two candidates, Mr. Jones was elected by a small majority. He was reelected in 1843, Mr. Polk being again his competitor. These two canvasses attracted much attention throughout the country, because of the powers of oratory displayed by the opposing candidates. In 1845 Gov. Jones declined a reelection, and at the expiration of his term in November of that year he retired to private life. In 1847 he became a candidate for congress in the Murfreesborough district, but withdrew from the canvass before the election. In 1848 he was a member of the national whig convention, where he zealously advocated the nomination of Henry Clay; but Gen. Taylor having received the nomination, Mr. Jones supported him cordially, and delivered several popular speeches in his behalf in different states. In 1850 he removed to Memphis, and in 1851 was elected to the U. S. senate. In 1854 he was a conspicuous supporter of the Kansas-Nebraska bill, and thenceforward became identified with the democratic party. At the expiration of his senatorial term, March 4, 1857, he again retired to private life.

JONES, JOHN, a Welsh clergyman, born in Caermarthenshire, died in London, Jan. 10, 1827. He completed his education at the Unitarian college of Hackney, and in 1792 was appointed classical and mathematical tutor in the Welsh academy at Swansea. He continued in this situation for 8 years, and then removed to Plymouth Dock, where he became minister of a Unitarian church. This charge he exchanged

in 1797 for that of the Unitarian congregation at Halifax, in Yorkshire. About 1800 he removed to London, and resided there during the remainder of his life, occupied chiefly as a classical teacher. A short time before his death the degree of LL.D. was conferred on him by the university of Aberdeen. He was the author of several works, the most important of which are: "Illustrations of the Four Gospels" (London, 1808); a "Greek and English Lexicon" (1828); and *Etymologia Græca* (1826), a new and enlarged edition of a Greek grammar published by him in 1804. Dr. Jones was among the first who introduced into England the practice of teaching Greek through the medium of English rather than of Latin. His "Greek and English Lexicon" was long in use.

JONES, JOHN PAUL, a commodore in the American navy during the war of the revolution, born of humble parentage at Arbigland, Scotland, near the mouth of the river Nith, July 6, 1747, died in Paris, July 18, 1792. His name was John Paul, that of Jones having been assumed in after life for some unknown reason. At the age of 12 he was apprenticed to a merchant of Whitehaven, who was engaged in the American trade. His first voyage was to Virginia, where his elder brother was established as a planter. He was afterward engaged for a short time in the slave trade, which he left in disgust, and made a number of voyages to the West Indies, realizing, it was said, a fortune by commercial speculations. At the commencement of the American revolutionary struggle he was in Virginia, having assumed the name of Jones. An offer of his services, which he made to the colonies, was accepted, and he was commissioned as a lieutenant in the navy, Dec. 22, 1775. His first service was in the *Alfred*, Capt. Dudley Saltonstall, a ship of 80 guns and 800 men, purchased from the merchant service. This was the flag ship of a squadron of 8 vessels, fitted out on the Delaware, and commanded by Commodore Ezekiel Hopkins. Jones was 1st lieutenant of her, and, it is said, hoisted on this occasion the first American flag ever displayed. The device it bore is not positively known, though it is believed to have been a pine tree with a rattlesnake coiled at its root. From the *Alfred* he was soon transferred to the command of the sloop *Providence*, of 12 guns and 70 men, in which vessel he made 16 prizes during a cruise of 6 weeks between the Bermudas and the gut of Canso. On Aug. 8, 1776, Jones received a captain's commission, and on Nov. 2 he sailed from Newport, R. I., in command of the *Alfred* and *Providence*, upon an expedition which he had suggested, the object of which was the capture of the coal fleet and the breaking up of the fishery at Cape Breton. This expedition was entirely successful. On June 14, 1777, Jones was appointed to the command of the *Ranger*, a new ship of 18 guns built for the navy at Portsmouth, N. H. On Nov. 1 he sailed for France, and arrived at Nantes, Dec. 2, expecting to be appointed by the American commissioners,

Messrs. Franklin, Deane, and Lee, to the command of the *Indien*, a large frigate then building at Amsterdam for the Americans. Being disappointed in this expectation, owing to the opposition made by the British minister at the Hague to the equipment of the frigate, and her subsequent sale to France, Jones made a cruise in the *Ranger* upon the coast of Scotland, where he harassed the coasting trade very much, and made a most daring and successful descent upon Whitehaven. He also attempted to capture the earl of Selkirk, who resided upon his estate near Kirkcudbright, on the river Dee. Jones thought that the possession of the person of this nobleman might bring about a system of exchanges of prisoners, to which England had hitherto shown a reluctance. This design failed, owing to the absence of the earl from home, but the party which landed to capture him took from his house a quantity of silver plate. When this plate was afterward sold, Jones became the purchaser, and restored it to Lady Selkirk. During this cruise the *Ranger* captured the *Drake*, a sloop of war superior to her in force. On May 8, 1778, the *Ranger* arrived at Brest, with the *Drake*, her prize, and 200 prisoners, being nearly double the number of her own crew. Jones was warmly greeted by the American commissioners, and received distinguished attentions from the French court, which was on the point of joining the American cause. From this time until Feb. 1779, Jones used every effort to obtain another and better command. The *Ranger* was despatched by the commissioners to America, Jones being retained by them in France. After many months of disappointment, and much fruitless correspondence, he, according to his own account, was struck with the saying of Poor Richard in an old number of Dr. Franklin's "Pennsylvania Almanac:" "If you would have your business done, go; if not, send." He immediately set out for Paris, and made such strong personal appeals to the minister, M. de Sartine, that on Feb. 4 he was appointed to the command of the ship *Duras*, an old Indiaman converted into a ship of war, and then lying at L'Orient. In compliment to Dr. Franklin, Jones upon application to the minister was permitted to change the name of this ship to that of the "Bon Homme Richard." After many vexatious delays, she was equipped for service, though in a very inefficient manner. On her main or gun deck she mounted 28 12-pounders, and on her quarter deck and fore-castle 14 9-pounders, making an armament of 42 guns in all. But Jones, determined to make the most of her, caused 12 ports to be cut in her gun room below, where 6 old 18-pounders were mounted. This expedient did not add to the efficiency of the ship, but, on the contrary, as will be seen, produced disastrous consequences. On Aug. 14, 1779, Jones sailed from L'Orient, having under his command a squadron of 5 vessels, one of which was the *Alliance*, Capt. Pierre Landais, a new and fast-sailing frigate, which had arrived some months before from America.

He had hardly put to sea before a mutinous temper was but too manifest among many of his officers and men, and in this respect the conduct of Capt. Landais was very conspicuous. This officer had served in the French navy, from which he had been dismissed on account of infirmity of temper. By the middle of September 26 vessels had been captured or destroyed by this squadron, and very great alarm created upon the E. coast of England. On Sept. 23 the Bon Homme Richard was off Flamborough Head, having in company the Alliance, Capt. Landais, and the Pallas, a ship mounting 32 light guns, commanded by Capt. Cottineau, a brave and good officer. Soon after noon the headmost ships of a fleet, known to be from the Baltic, were seen standing out from under Flamborough Head, and beating down toward the straits of Dover. This fleet was under convoy of the Serapis, 44, and Countess of Scarborough, 20. Signal for general chase was made by Jones, and the Alliance, being the fastest of the squadron, took the lead; but no sooner had she discovered the force of the English vessels of war than she stood off from them. At about 7½ o'clock the Richard came up with the Serapis, and closed with her, upon her weather quarter, to about half pistol shot. The weather was serene and beautiful, the water perfectly smooth, and the wind light at S. W., the ships heading to the northward. It was full moon, and Flamborough Head, less than a league distant, and the piers of Scarborough were covered with spectators to witness the combat. The Serapis now hailed the Richard, and was answered. A few unimportant questions passed, when broadsides were exchanged, and two of the old 18-pounders mounted in the Richard's gun room burst, blowing up the deck above and killing or wounding a large portion of the men stationed at them. This part of the battery was then abandoned, and the ports were closed. A close and heavy cannonade was now maintained by both ships for about an hour, when they fouled each other, and there was for a few moments a cessation of the firing. Capt. Pearson of the Serapis again hailed the Richard, asking if she had struck her colors. "I have not yet begun to fight," was the reply of Jones, and the action was immediately renewed. After considerable manœuvring the ships again came foul, when Jones with his own hands assisted in lashing the jib stay of the Serapis to the mizzen mast of the Richard. As soon as Capt. Pearson perceived this, he let go an anchor in the hope that his antagonist would drift clear of him, but the ships were now well secured together head and stern. During this time the combat was raging furiously. The ships being in actual contact, fore and aft, the guns of either were discharged into the side or through the ports of her antagonist. The effect of such a fire was terrible to both. Occasionally fighting with pikes and pistols took place through ports, and the American seamen, laying out upon the yards of their ship, dropped hand grenades on the decks of the Serapis. At

this juncture a most unexpected event took place. The Countess of Scarborough had surrendered to the Pallas, after a well contested action of an hour and a half, and Captain Cottineau entreated Capt. Landais, who had kept aloof with the Alliance, to take possession of his prize, and allow him to go to the assistance of Jones, which he declined; and the Alliance after making two long stretches to windward kept away, and coming upon the larboard quarter of the Richard opened a fire upon her. The evidence of this seems ample. At 9¼ an explosion took place on board the Serapis, caused by a hand grenade from the Richard, which killed and wounded 20 men. About 10 o'clock, owing to a cry which had been raised that the ship was sinking, the carpenter of the Richard released over 100 prisoners, a part of whom succeeded in getting on board the Serapis; and the gunner, alarmed at the quantity of water in the ship (for she had received many shots between wind and water) ran aft on the poop, crying for quarter, but was sternly silenced by Jones. The situation of the Richard now seemed hopeless. She was almost in a sinking condition, many of her guns were disabled, a large number of her prisoners were at large, the Alliance was deliberately firing into her, and some of the petty officers had set up the cry of fire. But it does not seem that the thought of surrendering had even entered the mind of Jones. The prisoners were compelled to work the pumps, and the action was continued with 8 light quarter deck guns, under his personal superintendence. Soon after 10 o'clock the Serapis struck, and the 1st lieutenant of the Richard, Mr. Dale, afterward Commodore Richard Dale, was ordered on board to take possession of her. The lashings were now cut, and as the ships separated, the main mast of the Serapis fell, carrying with it the mizzen topmast. Her cable was then cut, and Lieut. Dale made such sail as he could after the Richard. In the morning the spectacle presented by the Richard was singular and dreadful. She was on fire in two places, and had 7 feet water in her hold. Her counters and quarters on the lower deck were driven in, the whole of her main battery was dismounted, and she was cut to pieces in a most extraordinary manner. The after part of the ship, in line with the guns of the Serapis, was so completely beaten in, that the upper deck was only sustained by a few frames, which had been missed by shot. It being deemed impossible to carry her into port, the wounded were removed, and she soon after sank. The Serapis suffered much less. She was a new ship, in excellent condition, and much superior in force to the Richard, mounting 50 guns, though rated at 44. On her lower deck were 20 18-pounders, on her upper deck 20 9-pounders, and on her quarter deck and forecastle 10 6-pounders. Her crew consisted of 820 souls. The Richard, on the other hand, as has been stated, was an old ship, much decayed, her effective armament consisting of but 42 guns of light caliber. A por-

tion of her crew was absent in prizes, leaving the number actually engaged but 227 souls, and these were Irish, Scotch, Portuguese, Norwegians, &c., with but very few Americans. No authentic report of the loss on either side has ever been given, but the engagement was, beyond all doubt, the most obstinate and sanguinary one which ever occurred between single ships. Jones carried his prizes into the Texel. On his arrival in France he was received with the most distinguished honors. A sword was presented to him by the king, who also requested permission of congress to decorate him with the military order of merit. In 1781 he sailed for the United States, arriving in Philadelphia in February, where he was exceedingly well received. Congress voted him a gold medal, and Gen. Washington addressed him a highly complimentary letter. He was afterward employed to superintend the construction of a line of battle ship, the *America*, at Portsmouth, N. H., which he was to have commanded; but the ship was presented by congress to France. He then went to Paris, as an agent for prize money, and while there was invited into the Russian service with the rank of rear admiral, but was disappointed at not receiving command of the fleet in the Black sea. He quarrelled with the admiral, the prince of Nassau, and owing to the intrigues of enemies fell into disfavor at court, and was finally permitted by the empress Catharine to retire from the service, with a pension which was never paid. He took up his residence in Paris, where he died in poverty and neglect.

JONES, NOBLE WIMBERLY, an American physician and revolutionary patriot, born in Georgia in 1725, died in Savannah, Ga., Jan. 9, 1805. He was the son of one of the first settlers in the state, held a military commission at an early age, and was a member of the assembly in 1761. He was one of the leading revolutionists in Georgia in 1774, was a delegate to congress in 1775, lost one of his sons at the capture of Savannah by the British in 1778, was himself made prisoner at the fall of Charleston in 1780, was exchanged in 1781, and was immediately chosen again a delegate to congress, and began to practise his profession in Philadelphia. He had an extensive medical practice in Charleston from 1782 to 1788, after which he lived in Savannah. He was president of the convention by which the constitution of the state was amended in 1795.

JONES, OWEN, an English architect and decorator, born in Wales about 1809. After serving an apprenticeship to Mr. Lewis Valliamy, he spent several years in travelling through southern Europe, Turkey, and Egypt. During a visit to Granada in 1834, in conjunction with M. Jules Goury, he made careful drawings of the palace of the Alhambra and of other Moorish remains, with a view of preparing an illustrated work on the subject. Goury died at the outset of the undertaking, which Mr. Jones thenceforth prosecuted alone, visiting the Al-

hambra again in 1837 to complete his drawings, and superintending with great care the printing of the illustrative designs in colors. In 1842 the work was published in an unusually costly style, under the title of "Plans, Elevations, Sections, and Details of the Alhambra," &c. (fol., London), accompanied by a translation of the Arabic inscriptions and a historical notice of the Moorish kings of Granada by Señor Pascual de Gayangos. In the same year appeared his "Designs for Mosaic and Tessellated Pavements" (4to., London). The Mohammedan, and more particularly the Moorish style of ornamentation, has been strongly advocated by him, and his labors have greatly developed the science of chromatics as applied to the internal and external decoration of buildings. In 1851 he was appointed a superintendent of the works in connection with the crystal palace exhibition in Hyde park, London, and his plans for decorating the structure were carried out in a modified form. In 1852 he became director of decorations to the crystal palace company, and, upon the erection of their building at Sydenham, superintended the construction and adornment of the Egyptian, Greek, Roman, and Alhambra courts, and the decorative painting of the general fabric. His polychromatic decoration of the Greek court having excited comment, he published "An Apology for the Coloring of the Greek Court," in which he took the ground that ancient sculpture was usually painted, and that the exterior of marble buildings was frequently so embellished. In illustration of his views he painted a portion of the casts of the Elgin marbles at Sydenham in parti-colors, the hair being gilt. His Alhambra court is the finest specimen of colored decoration yet produced in England. He has written a "Handbook to the Alhambra Court," explaining the principles of its ornamentation. His remaining publications are: "Views on the Nile from Cairo to the Second Cataract" (fol., 1848); "An Attempt to define the Principles which should regulate the Employment of Color in the Decorative Arts, a Lecture" (1852); and "The Grammar of Ornament" (fol., 1856), one of the most elegant works of the age, containing 100 plates illustrating various styles of ornament, printed in colors. He has also lectured frequently on his favorite subject, and has translated Seroux d'Agincourt's "History of Art by its Monuments," &c. (fol., 1847). He has frequently been employed in ornamental chromatic designs for the title pages of illustrated books.

JONES, THOMAS RYMER, an English writer on comparative anatomy and physiology, born about 1810. He became a member of the college of surgeons of England in 1838, but on account of an impediment in his hearing has never practised his profession. Devoting himself to the study of comparative anatomy, he published several contributions to that branch of science in the "Proceedings of the Zoological Society," and was soon after appointed professor of comparative anatomy in King's col-

lege, London. His first work, "A General Outline of the Animal Kingdom" (8vo., 1841), written to supply a want in English scientific literature, established his reputation as a comparative anatomist and physiologist, and is still regarded as one of the best works of its kind in any language. About this time he was appointed Fullerian professor of physiology in the royal institution, and subsequently he became examiner in comparative anatomy and physiology in the London university. In 1844 and 1852 were published the first two volumes of his Fullerian lectures, under the title of "Lectures on the Natural History of Animals," the work being still incomplete. His latest publication is "The Aquarian Naturalist" (London, 1858). He has also been a contributor to the "Cyclopædia of Anatomy and Physiology," and has an extended reputation in England as a lecturer on natural history.

JONES, WILLIAM, an English divine, born in Lowick, Northamptonshire, in 1726, died in Nayland in 1800. He was educated at the Charterhouse, and at University college, Oxford, and became successively vicar of Bethersden (1764), rector of Pluckley, perpetual curate of Nayland (1776), and rector of Paston and of Hollingbourn, the last 8 of which appointments he held at his death. He was eminent as a scholar and theologian, and proficient in music. He was an intimate friend of Bishop Horne, and associated with him in maintaining the theological and philosophical opinions of John Hutchinson. His principal works are: "The Catholic Doctrine of the Trinity Proved" (1756), by which and by several other treatises on the same subject he is best known; "Lectures on the Figurative Language of the Holy Scriptures" (1756; 6th ed., 1821; new ed., 1849), which have been highly esteemed, though distinguished for imaginative and allegorical interpretations; "The Scholar Armed against the Errors of the Time," a compilation (2 vols., 1792); and a "Life of Bishop Horne" (1795). He wrote many other religious works, and several treatises on music, composed anthems and other musical pieces which were much admired, and was the originator of the "British Critic." A collected edition of his works, with a biography by William Stevens, was published in 1801 (12 vols.; new ed., 6 vols., 1810). Two posthumous volumes of his sermons, edited by Henry Walker, appeared in 1830.

JONES, SIR WILLIAM, an English orientalist, born in London, Sept. 28, 1746, died in Calcutta, April 27, 1794. His father, an eminent mathematician, died when he was but 8 years old, and the care of his education devolved on his mother, who was noted for her erudition and virtues. She withdrew herself much from society, that she might live only for her son, and her constant aim was to excite his curiosity, to interest him in books, and to produce habits of study. When 7 years old he was sent to the grammar school at Harrow, where he remained 10 years, not only surpassing his associates in

classical studies, but making some progress in Hebrew and Arabic, and applying himself to French and Italian during his vacations. The head master affirmed that he was "a boy of so active a mind, that, if he were left naked and friendless on Salisbury plain, he would nevertheless find the road to fame and riches." In 1764 he was entered at University college, Oxford, his mother accompanying him thither, and prosecuted with the greatest diligence his studies in the oriental and modern European languages, preserving his health by athletic exercises, in which also he excelled. In 1765 he was invited to reside in the family of Earl Spencer, as tutor to Lord Althorp, then 7 years of age, which office he held for 5 years, during which he twice visited the continent, always prosecuting his studies. He was elected during this period to a fellowship at Oxford. Meantime his fame for oriental scholarship had begun to extend, and in 1768 Christian VII. of Denmark requested him to translate into French a Persian life of Nadir Shah. This was published (London, 1770) in connection with a dissertation, also in French, on oriental poetry, containing translations of several of the odes of Hafiz. In the following year appeared his Persian grammar (7th ed. 1809; last ed. 1828), which, as enlarged by subsequent editors, long remained the standard text book on the subject. In 1770 he became a student at the Temple, and began to contemplate "the stately edifice of the laws of England," but was immediately called upon to defend his university against the aspersions of the French orientalist Anquetil du Perron. His pamphlet (1771) was anonymous, in idiomatic and effective French, and was universally admitted to surpass the attack both in wit and learning. In the following year he published a small volume of poems, chiefly translations from the Asiatic languages, which was followed by the more important *Poeseos Asiaticae Commentariorum Libri Sex* (1774; republished by Eichhorn, Leipsic, 1776), in which with equal skill and erudition he aimed to familiarize the European mind with oriental modes of thought and expression. Called to the bar in 1774, he left at Oxford all his oriental books and manuscripts, and applied himself exclusively and with a patriotic enthusiasm to legal studies. "Had I lived at Rome or Athens," he wrote, "I should have preferred the labors, studies, and dangers of their orators and illustrious citizens, connected as they were with banishment and even death, to the groves of the poets, or the gardens of the philosophers. Here I adopt the same resolution. The constitution of England is in no respect inferior to that of Rome or Athens." With such views, he was ambitious of a seat in parliament, and in 1780 stood for the university of Oxford; but his liberal politics, and his condemnation of the American war and of the slave trade, deprived him of all chance of success, and he withdrew from the contest. His political opinions were declared in several essays, as his "Inquiry into the Legal Mode of Suppressing Riots,"

"Plan of a National Defence," and "Principles of Government;" and he produced in 1781 a more elaborate work on the "Law of Bailments," which alone, according to Judge Story, would have given him "a name unrivalled in the common law for philosophical accuracy, elegant learning, and finished analysis." He resumed his oriental studies to produce a translation of the "Moallakat, or Seven Arabian Poems which were suspended in the Temple at Mecca" (1788). In 1788 he was married, knighted, and, through the influence of Lord Ashburton, appointed a judge of the supreme court of judicature at Fort William, in Bengal. In his new home he devoted the leisure of the 11 remaining years of his life to researches in oriental literature. One of his first acts was to collect several persons of similar scholarship and tastes, and to form them into a society "for inquiring into the history and antiquities, the arts, sciences, and literature of Asia." Of this body he was the first president; its first volume of memoirs appeared in 1788; and to its "Asiatic Researches" European scholars have been largely indebted. He contributed to the first 4 volumes numerous treatises of great importance. His next object was to acquire a thorough knowledge of Sanscrit, in order to make a digest of Hindoo and Mohammedan laws similar to the codification of Greek and Roman law effected by Justinian. This task he did not live to complete, and it was afterward finished under the superintendence of Mr. Colebrooke; but the ordinances of Manu, the foundation of Hindoo jurisprudence, were translated by him and published in 1794. He also translated *Sakontala*, or "The Fatal Ring," an Indian drama by Kalidasa; the *Hitopadesa*, the original of the famous fables of Bidpay; the tales and fables of Nizami; and portions of the Ramayana and the Vedas. These were but his minor labors, performed in the intervals of official duties, which he discharged with an exactitude and conscientious integrity long remembered at Calcutta both by Europeans and natives. He had decided to return to England, when he was surprised by death. During the latter part of his life he enjoyed a reputation for scholarship unsurpassed by that of any living man. As a linguist he had no superior but Mezzofanti; he was familiar with 27 languages, many of which he had critically mastered, and also the literature which they contained. No predecessor had equalled his attainments in Sanscrit, Arabic, and Persian. "He seems to have acted," says Lord Teignmouth, "on this maxim, that whatever had been attained was attainable by him; and he was never observed to overlook or to neglect any opportunity of adding to his accomplishments or his knowledge. When in India his studies began with the dawn, and, in seasons of intermission from professional duties, continued throughout the day; meditation retraced and confirmed what reading had collected or meditation discovered." His motto, altered from that of Sir Edward Coke, was:

Seven hours to law, to soothing slumber seven,  
Ten to the world allot, and all to heaven.

His translations, especially that of *Sakontala*, are as remarkable for elegance as precision; all his writings demonstrate purity of moral feeling, and he was personally esteemed a model of amiability and integrity. The pundits of Bengal wept for his loss, and marvelled at the progress he had made in the sciences which they professed. A collected edition of his works was published in 6 vols. in 1799; a life by Lord Teignmouth was added in 1804; and the whole was reprinted in 1807, in 18 vols.

JONES, WILLIAM ALFRED, an American essayist, born in New York, June 26, 1817. He was graduated at Columbia college in 1836, and has for several years been librarian of that institution. He has been a frequent contributor of literary criticisms to periodicals, chiefly to the "Church Record," "Arcturus," the "Whig Review," and the "Democratic Review." Several revised collections of his essays have been made: the "Analyst, a Collection of Miscellaneous papers" (New York, 1840); "Literary Studies" (2 vols., 1847); "Essays upon Authors and Books" (1849); and "Characters and Criticisms" (2 vols., 1857). He published in 1849 a memorial of his father, David S. Jones, with notices of the Jones family of Queens co.

JONSON, BENJAMIN, commonly called BEN, an English dramatist, born in Westminster in 1578 or 1574, died Aug. 6, 1637. He was the posthumous son of a clergyman, and during his childhood his mother was married a 2d time, according to tradition, to a master bricklayer named Fowler. Ben was educated at Westminster school under the tuition of Camden, and subsequently followed the calling of his stepfather, whom he assisted in building part of Lincoln's Inn. Finding this occupation not altogether to his taste, he enlisted in the army, and served a campaign in the Low Countries. Returning to England, he is said to have entered himself at St. John's college, Cambridge; but this statement, as well as others respecting his early career, is of doubtful authenticity. At about the age of 20 he went upon the stage, meeting, however, with but indifferent success as an actor, and at the same time began either by himself or conjointly with brother dramatists to write plays, beside being employed to alter, adapt, or retouch the works of others. His additions to Kyd's "Spanish Tragedy," made in 1601-'2, are called by Lamb "the very salt of the old play." In 1596 appeared his "Comedy of Humors," which was recast and brought out in the Globe theatre in 1598 under the title of "Every Man in his Humor," Shakespeare, who is said to have aided in the composition of the play, being one of the performers. This work, the first English comedy, deserving the name, in which the story was taken from the domestic life of the people, and their prevailing manners were delineated, is called by Hallam "an extraordinary monument of early genius." About the same time he was imprisoned for killing

Gabriel Spenser, an actor, in a duel, and during his confinement was converted to the Roman Catholic faith, although he subsequently became again a Protestant. "Every Man in his Humor" was succeeded in 1599 by "Every Man out of his Humor," a less able performance, in which the "euphuism" so fashionable at that time is ridiculed; "Cynthia's Revels" (1600); the "Poetaster" (1602), which involved the author in a quarrel with Decker, who retaliated upon him in "Satyromastix;" and "Sejanus," a tragedy (1608), in which Shakespeare is said to have taken his farewell of the stage as an actor. Shortly after the accession of James I., Jonson, in conjunction with Chapman and Marston, wrote the comedy of "Eastward Hoe," containing some reflections on the Scottish nation, in consequence of which the 8 dramatists were imprisoned and threatened with the loss of their ears and noses. After a short confinement they were pardoned, and Jonson commemorated his release by an entertainment at which his mother was present, and declared her intention to have poisoned herself and her son if the threatened indignity had been inflicted upon him. He made his peace with James, and until the death of the latter was employed by him in writing masques and other court entertainments, furnishing at least one annually on Twelfth night. Between 1605 and 1611 appeared his comedies of "Volpone," "Epicoene, or the Silent Woman," and the "Alchemist," and the tragedy of "Catiline." In 1618 he visited the continent as travelling tutor to a son of Sir Walter Raleigh, a position for which he was little fitted and to which he did no credit. He was now at the height of his popularity, a favorite at court and a man of great authority among his contemporaries and associates, as well from his reputation for learning as for his native humor and wit. Among his favorite haunts at this time was the Mermaid club at the Mermaid tavern in Bread street, Cheapside, founded by Sir Walter Raleigh in the beginning of the century, and where he was thrown into the society of Shakespeare and the great Elizabethan dramatists, and of Raleigh, Camden, Selden, Donne, and others. The "wit combats" at the Mermaid between Jonson and Shakespeare have been alluded to by Fuller, in the well known passage in which he compares the former to a Spanish galleon and the latter to an English man-of-war. Unfortunately for literary history, no Boswell has chronicled these meetings. The Apollo club, which met at the Devil tavern in Fleet street, was founded by Ben Jonson himself at a later date. The laws of the club, written by the founder in Latin, were inscribed in letters of gold over the fireplace; and here he presided over a knot of young admirers, who were said to be "sealed of the tribe of Ben," with a literary ascendancy equaling that of Dryden in later times at Wills's coffee house, or of Dr. Johnson at the literary club. In 1619 he received the appointment of poet

laureate with a pension of 100 marks, and about the same time made a pedestrian excursion to Scotland, in the course of which he visited Drummond of Hawthornden, who has preserved some curious notes of his conversation. The character which the Scottish poet has drawn of his guest is that of a man arrogant and conceited, priding himself upon his acquirements and studiously depreciating those of others. These qualities brought him frequently into collision with his contemporaries, and on the title pages and in the prefaces of his unsuccessful dramas he was in the habit of abusing in no measured terms authors, actors, and the public, whom he not unfrequently likened to beasts or fools. His fortunes had been for some time on the wane, when in 1628 he was attacked by palsy, and compelled also by poverty to write for the stage. His "New Inn" was unsuccessful, but Charles I., hearing of his necessities, sent him a present of £100, and raised his salary to that sum, adding a tierce of canary annually, a perquisite which has pertained to the office of the poet laureate to the present time. Notwithstanding this assistance, his improvident habits kept him always in difficulties, and in the latter part of his life he suffered from poverty, or rather from an inability to indulge in the pleasures of his earlier years, which was with him equivalent to it. He wrote 2 or 3 more dramas, which Dryden calls his "dotages," and left the "Sad Shepherd," a fragment of great beauty, though rather poetical than dramatic. It was his last song, and "his laurel remained verdant amid the snow of his honored head." Jonson's pride of learning, which obtrudes itself into some of his best works, has interfered not a little with their popularity as literary performances. His "learned sock," however, was not always palatable in his own time, and his plays were seldom successful until the pedantic passages had been omitted. Whenever he forgets his learning, as in the smaller lyrics scattered through his masques and in some of his dramatic pieces, he displays a true and elegant taste, and a delicacy of fancy unsurpassed by any of his contemporaries, unless by Shakespeare. In the opinion of some of his critics his genius was more poetic than dramatic. His delineations of character are striking, original, and artistic, rather than natural. Fuller has summed up his points as follows: "His parts were not so ready to run of themselves as able to answer the spur; so that it may be truly said of him, that he had an elaborate wit, wrought out by his own industry. He would sit silent in learned company and suck in (beside wine) their several humors into his observation. What was ore in others he was able to refine to himself." His comedies are esteemed his best performances, although only "Every Man in his Humor" and the "Alchemist" in a very abridged form are now performed. His tragedies, founded on classic history, and burdened with long extracts from Sallust, Tacitus, and other Latin authors, are

correct in form, but lack vivacity. He published in 1616 a folio edition of most of his works produced previous to that date, carefully revised and corrected. Various collective editions subsequently appeared, the first good one being that of Gifford (9 vols. 8vo., 1816), accompanied with notes critical and explanatory, and a biographical memoir, written with ability, but in too partisan a spirit. Moxon's reprint, the latest, prefaced by Gifford's memoir, (royal 8vo., 1853), contains 17 plays, 15 of which were performed on the stage; over 80 masques and interludes; epigrams, translations from Horace, an English grammar, and a variety of miscellanies in prose and verse. He was buried in Westminster abbey, and the pithy inscription upon his tomb: "O rare Ben Jonson," was added at the expense of an eccentric Oxfordshire squire, called Jack Young, who, observing the tomb to be destitute of an epitaph, gave a mason 18 pence to carve the words upon it. Recent researches in the state paper office are said to have developed facts in the life of Jonson, presenting his character in a less favorable light than it has usually been regarded, and rendering it probable that a new biography of him will have to be written.

JONSSON, FINNUR, an Icelandic historian, born in Hitardal, Jan. 16, 1704, died July 28, 1789. In 1725 he entered the university of Copenhagen, and in 1728 was present at the fire which destroyed the great collection of Icelandic MSS. formed by his patron Arni Magnússon. In his endeavors to save these MSS. he neglected his own effects and library, which were burned. On returning to Iceland he obtained a benefice, and in 1754 was appointed to the bishopric of Skalholt. His inclinations were opposed to an ecclesiastical career; his motive for embracing it was that he might have the means of educating a large family of children left by his uncle. He wrote many works in Latin and Icelandic, the principal of which is the *Historia Ecclesiastica Islandiæ*, published under the care of his son Hannes Finnsson at Copenhagen (4 vols. 4to., 1772-'9). The latter, who succeeded his father in the bishopric, made important additions to this work, edited several sagas, and was the founder of the Icelandic agricultural society.

JOPPA. See JAFFA.

JORDAENS, JACOB, a Flemish painter, born in Antwerp in 1594, died there in 1678. He studied in the school of Adam Van Oort, whose daughter he married. Rubens, whom he imitated, intrusted him with the execution on a large scale of many of his small sketches. He excelled in the representation of Bacchanalian subjects and scenes of festive riot. Of these, the pictures of the "Satyr and the Man blowing hot and cold," and "Pan and Syrinx," are well known specimens. He was an industrious painter, designing and executing with great facility, and in the course of his long life finished an immense number of works.

JORDAN (Hebrew *Hayyarden*, now called

by the Arabian population of Palestine *El-Sheria* or *Sheriat-el-Kebir*), the only large river in Palestine, and with one or two exceptions the only stream in that country which is perennial. Its sources are on the southern declivity of Mt. Libanus and on Mt. Hermon. Josephus names two, the one at Paneion (now Banyas), and the other at Dan or Daphne (Tell-el-Kadi), and forming together the "Little Jordan." The union of the two streams takes place about 4 miles from Tell-el-Kadi. A third source of the Jordan, larger and longer than the two others, which under the name of Nahr Has bani comes from Hasbelah, and, after having received several small streams, flows with the two other sources into Lake Merom (now Huleh), is not mentioned by Josephus. On quitting the lake, the river is sluggish and turbid, but is soon purified by passing over a rocky bed where its mud is deposited. About 2 m. below the lake is a bridge called Jacob's bridge, where Jacob on his return from Mesopotamia is said to have crossed. It was built after the crusades, probably in connection with the caravan route from Egypt to Damascus. The breadth of the river at this place has been variously estimated from 64 to 80 feet. About 13 m. below it enters the lake of Tiberias or Gennesareth, which according to Lynch's survey is 652 feet above the sea. Issuing from the S. extremity of this lake, the river enters a broad valley, or *ghor*, by which name the natives designate a depressed tract or plain between the mountains. The Bible calls it "the plain." Its width varies from 5 to 10 m. The river at first winds very much, and flows first near the W. hills, then turns to the E., and continues to the district called Kurn-el-Hemar, then again returning toward the W. side. Lower down it rather follows the middle of the great valley. Its course is so tortuous that within a space of only 60 m. long and 4 or 5 m. broad it traverses at least 200 m. and plunges over 27 formidable rapids. It enters the Dead sea at its N. extremity, after a total direct course of 130 m. Its mouth is 180 yards wide and 8 feet deep. Its principal affluents are the Zurka and Sheriat-el-Mandhur, or Jarmuk. Its breadth and depth greatly vary, which circumstance explains the great discrepancies in the reports of travellers. The sources and the course of the Jordan were explored in 1847 by the English Lieut. Molyneux, and in 1848 by an American expedition under Lieut. Lynch (see "Narrative of the U. S. Expedition to the River Jordan," New York, 1849). As Christ was baptized by John in the Jordan, Christians have often regarded it as a special privilege to receive baptism in its waters, and water is even now occasionally procured from the Jordan for the baptism of princes.

JORDAN, CAMILLE, a French political orator, born in Lyons, Jan. 11, 1771, died in Paris, May 19, 1821. He was a pupil of the Oratorians in his native city, and his liberal opinions were tempered by strong religious sentiment. When scarcely 20 years old he wrote a pam-

phlet against the civil constitution which the national assembly wished to impose upon the French clergy. A decided opponent of the revolutionary government, he distinguished himself in the insurrection at Lyons, and left France on the fall of that city, Oct. 9, 1793. Returning to his native country after the 9th Thermidor, he was elected in 1796 to the council of 500, advocated the principles of religious liberty in a report, and, having opposed the directorial government, was again compelled to seek a refuge abroad after the 18th Fructidor. Recalled in 1800, he energetically opposed the designs of Bonaparte, and denounced the frauds in the election of 1802 in a pamphlet entitled *Vrai sens du vote national pour le consulat à vie*. From that period till the return of the Bourbons he devoted himself exclusively to literature. In 1816 he was elected to the chamber of deputies. A strong adherent of monarchy, he nevertheless supported the most liberal measures, and signalized himself as a member of the opposition after the death of the duke de Berry. He was one of the fathers of the *doctrinaire* school of politics.

JORDAN, DOROTHY, or DORA, an Irish actress, born near Waterford, Ireland, in 1762, died at St. Cloud, July 8, 1816. She was the daughter of a Capt. Bland, an Irish gentleman, who, having married her mother under age, procured the invalidation of the union. At 16 she made her début in Dublin, under the name of Miss Francis, as Phebe in "As You Like It." She soon, under the name of Mrs. Jordan, by which she was afterward known, was engaged at the York theatre, where she remained for 8 years. She then went to London, and made her first appearance there, Oct. 18, 1785, soon becoming immensely popular in comedy and musical farce. By her talents and remarkable beauty she attracted the attention of the duke of Clarence, afterward William IV. She was at that time under the protection of Mr. Richard Ford, and had several children, but yielded to the admiration of the royal duke. Her children by him were 10 in number, and are known under the name of Fitz-Clarence. At the termination of this connection she went to France, and died there in obscurity and poverty. A monument by Chantrey was erected to her memory at St. Cloud by William IV. after his accession to the throne. Her professional career was brilliant. She was of an amiable character and a kind heart, and her domestic duties were performed with devotion to the interests of her family. Her "Memoirs," written by J. Boaden, were published in 1831. There is some mystery as to her retirement, which is not cleared up by her biographer, and it was generally supposed that she did not actually die at the time and place stated, but that she lived in England for 7 years after under a different name.

JORGENSEN, JOSEPH, a Danish adventurer, born in Copenhagen in 1779, died in New South Wales about 1830. He was a member of the well known Danish family of watch and clock

makers named Jürgensen, but Anglicized the name by writing it Jorgenson. Showing no disposition to engage in the family occupation, he was apprenticed at 14 years of age to the master of an English collier, and subsequently, it is said, served in the British navy as a midshipman. Having returned to Copenhagen, in 1807 he sailed thence in command of a privateer, and was captured and taken to England, where he was put upon his parole. The unprotected condition of the remote Danish colonies at that time suggested to him the idea of an expedition against Iceland, and he succeeded in inducing a London merchant named Phelps to freight a vessel for the purpose of opening a trade with the inhabitants. Jorgenson arrived at Reikiavik in Jan. 1809; but finding that obstacles to commerce were raised by the governor, Count Trampe, he returned to England, and in company with Mr. Phelps made his reappearance in Reikiavik in the succeeding June. A convention had meanwhile been concluded between Trampe and the commander of a British vessel of war, providing for trade between the Icelanders and British subjects; but notwithstanding the solicitations of Phelps and Jorgenson, the governor refused to promulgate it. Under these circumstances the former landed, June 25, with a party of 12 sailors, arrested Count Trampe and took him on board their vessel, and on the succeeding day Jorgenson issued a proclamation that Iceland was free and independent of Denmark. Another proclamation, dated July 11, announced that Jorgenson had assumed the position of protector of the country, with supreme power, until the formation of a regular constitution. No opposition was offered to these proceedings, although the inhabitants of the island numbered upward of 50,000, and the army of Jorgensen did not exceed 8 men, the Icelanders evidently feeling no dissatisfaction at the change of masters. The protector succeeded at the outset by the repeal of various restrictions in conciliating all classes; but his wholesale confiscations of Danish property began presently to excite suspicions as to his character and intentions. In August the British sloop of war Talbot suddenly made her appearance at the island, and her captain, having, upon the application of some of the inhabitants, examined into the transactions of the previous two months, sent both Jorgensen and Trampe to England. The former opened a correspondence with the admiralty, but it having transpired that he was a prisoner of war who had broken his parole, he was confined for a time in Tothill Fields prison. In 1811 he published a work entitled "State of Christianity in Otaheite, and a Defence of the Gospel against Modern Antichrists." Upon the conclusion of the war he travelled on the continent, and in 1817 published "Travels in France and Germany in 1815-'17." He subsequently fell into bad habits, and in May, 1820, was tried at the Old Bailey for theft, and sentenced to 7 years' transportation. After several months' confine-

ment he was released on condition of leaving the country; but having failed to do so, he was rearrested and received sentence of death. This was changed to transportation for life, and in 1825 he was sent to New South Wales. Previous to his departure from England he published "The Religion of Christ is the Religion of Nature, written in the condemned cells of Newgate, by Jorgen Jorgenson, late Governor of Iceland" (8vo., London, 1827).

JORNANDES, or according to the oldest MSS. JORDANES, a Gothic historian, who lived about the middle of the 6th century. He was at first one of the notaries or rather secretaries of the king of the Alani, who inhabited Mœsia, and afterward, becoming a convert to Christianity, he embraced the monastic state. It has been said, but without proof, that he was bishop of some city of Italy. He wrote *De Getarum sive Gothorum Origine et Rebus Gestis*, which is chiefly an extract from Cassiodorus's lost "History of the Goths." Notwithstanding its many shortcomings and incorrect style, it is an important work. He left also, under the title *De Regnorum ac Temporum Successione*, a dry synopsis of universal history, which has been generally printed at the end of his Gothic history. The 1st edition of the latter is that published by Pentinger with Warnefrid's "History of the Lombards" (Augsburg, 1515). It has been frequently reprinted in various historical collections; the last and most correct edition is to be found in Muratori's *Scriptores Rerum Italianarum*.

JORTIN, JOHN, an English divine and author, born in London in 1698, died in Kensington, Sept. 5, 1770. He was graduated at Cambridge in 1719, and after holding various livings he became archdeacon of London in 1764. He was a voluminous and elegant writer. His most important works are: "Observations upon Authors, Ancient and Modern;" "Remarks on Ecclesiastical History;" "Life of Erasmus;" and *Lusus Poeticus*, a small volume of Latin poetry. He also wrote criticisms on Spenser, Milton, Tillotson, and Seneca, and published several volumes of sermons.

JORULLO, a volcano of Mexico, in the department of Valladolid, lat. 19° 9' N., long. 103° 51' W., about 120 m. E. from the Pacific. It is one of the 5 volcanoes which are ranged upon an E. and W. line extending across Mexico. These are Tuxtla, Orizaba, Popocatepetl, Jorullo, and Colima. Jorullo stands upon the plain of Malpais, a portion of the great platform the elevation of which is 2,000 to 3,000 feet above the level of the sea. Around this plain are hills of basalt and ancient volcanic rocks; but up to the middle of the last century the region was not known to be subject to volcanic action. It was under cultivation, and watered by two streams, the Quitimba and San Pedro. In June, 1759, earthquakes began to be frequent, and so continued to the end of September, when flames burst forth from the ground, and rocks were hurled upward to great heights. A chasm

opened on a line extending N.N.E., S.S.W., and on this 6 volcanic cones were formed; the least rising 300 feet above the plain, and Jorullo 1,700 feet. Streams of lava flowed forth from it, and the eruptions continued till February of the next year. In 1808 the locality was visited by Humboldt. He found around the central group an area of about 4 square miles which appeared to have been raised up in convex form, the portion near to the cones being about 550 feet higher than the margin of this area, and the slope at an angle with the horizon of about 6°. Scattered over this surface were thousands of small mounds called *hornitos* or little ovens, 6 to 9 feet high, from which issued steam and sulphurous vapors. The plain was traversed by large fissures, which sent forth similar exhalations. The two little rivers were lost beneath the surface on the E. side, and appeared again on the W. as hot springs. The ground was still hot, but had been gradually cooling since the time of the great eruption. Humboldt was of the opinion that the whole raised surface had been puffed up from its former level by a force applied beneath. Mr. Scrope, however, suggests that the elevation was more probably caused by the accumulation of lava flowing from the several outlets near the centre; and he states in support of this view that lava currents elsewhere cool at angles with the horizon about the same as those of the slopes around Jorullo. In 1827 it was observed that the vapors had ceased to appear from the *hornitos* or *fumaroles*, and at the bottom of the crater there were but faint exhibitions of them. The ground had then become cool, the natives were again cultivating the more fertile tracts upon the plain, and the new hills were covered with a thick growth of wood.

JOSEPH, son of Jacob and Rachel, having a younger brother Benjamin and 10 elder half brothers. He was envied by his brethren on account of his father's partiality toward him; and their aversion was increased by two dreams that he told, in which was foreshadowed his pre-eminence in the family. Conspiring against him, they sold him for a slave to a caravan of Arabian merchants, and he was taken to Egypt. There he rose to the highest power in the house of Potiphar, an officer of Pharaoh. The wife of Potiphar, stung by his rejection of her licentious advances, caused his imprisonment on a false charge; but his successful interpretation of the king's dreams soon raised him to supreme authority at the court. One of the dreams foretold a famine, against which he made ample provision, and such was his distinction that he married the daughter of the high priest of On or Heliopolis. While the famine prevailed, his brethren came from Canaan to Egypt to purchase corn. He at once recognized them, and after a period of delay in which he became convinced that they had lamented and repented of their former cruelty to him, he made himself known to them, and appropriated to Jacob and his family the land of Goshen. The Egyptian

people were at length obliged to pay with their land for food from the public granaries, so that "Joseph bought all the land of Egypt for Pharaoh," and the whole territory of the country, excepting that of the priests, was let to the population as tenants. The story of Joseph is one of the most interesting portions of the Mosaic writings. He died at the age of 110 years, and left two sons, Manasseh and Ephraim, who, being adopted by Jacob, took their place among the heads of the tribes of Israel.

JOSEPH, the spouse of Mary the mother of Jesus Christ. He was of the tribe of Judah, and a descendant of David. St. Matthew and St. Luke give his genealogy, the former making him the son of Jacob and descended from David through Solomon, and the latter calling his father Eli and tracing his lineage through Nathan. This discrepancy is explained in various ways. Julius Africanus supposes that Jacob and Eli were brothers, and that, Eli dying without children, Jacob married his widow, who bore him Joseph. The child was thus the son of Eli according to the Mosaic law, but of Jacob according to nature. Other commentators assume that the genealogy given by St. Luke is that of Mary. It is not known where Joseph was born. He lived at Nazareth, where, according to the received tradition, he followed the trade of a carpenter, when he was betrothed to Mary. Finding her pregnant, he was minded to put her away; but being warned by an angel in a dream that she was with child of the Holy Ghost, he took her to himself, but knew her not till she had brought forth her first born son, who was called Jesus. Joseph is supposed to have died before the crucifixion of the Saviour, but there is little mention of him in the Scriptures. He is held in high honor in the Roman Catholic church, and March 19 is assigned as his festival. In painting he is represented with a lily or flowering branch.

JOSEPH I., emperor of Germany, of the house of Hapsburg, eldest son of Leopold I. by his 3d wife, born July 26, 1678, died in 1711. He was elected titular king of Hungary and Rome at an early age, and after the death of his father succeeded to his hereditary possessions, as well as to the imperial throne of Germany in 1705, inheriting at the same time a double war, against Louis XIV. for the succession of his brother Charles to the throne of Spain, and in Hungary against the revolted patriots under Francis Rákóczy. He was willing to make concessions to the Protestants of Hungary and other provinces, frequently attempted to negotiate with the insurgents, and readily yielded to the demands of Charles XII. of Sweden in behalf of the Protestants of Silesia, which country the young conqueror crossed on his march from Poland to Saxony without even asking the permission of the distracted emperor. The victories of Marlborough and Eugene in the war of the Spanish succession allowed Joseph, who had personally taken part in the siege of Landau, to send considerable forces against the

Hungarians, and dissensions which broke out in the camp of the latter slowly prepared a final triumph of the imperial arms. Shortly before the death of Joseph, Count Pálffy succeeded in concluding a treaty with the insurgents at Szatmár, in the absence of Rákóczy. Joseph was of a mild disposition, and exceedingly fond of ceremony and of the chase. He founded an academy of sciences and arts at Vienna, and a national bank. He was succeeded by Charles VI.

JOSEPH II., emperor of Germany, elder son of Francis I. and Maria Theresa, born March 13, 1741, died Feb. 20, 1790. His mother, the last offspring of the original Austrian line of Hapsburg princes, had acquired her right of succession to the various hereditary thrones of her father by the pragmatic sanction of the latter, and the supreme power in Germany by the election of her husband Francis of Lorraine (subsequently of Tuscany) to the imperial dignity; but she had scarcely ascended the throne when all her claims were disputed by a number of enemies, among whom Frederic the Great of Prussia was the ablest and most dangerous. When Joseph was born, his mother placed him and her rights under the protection of the Hungarian nation, which gallantly responded to her confidence, and Prince Batthyányi afterward took the principal charge of his education. Ambitious, but obstinate, Joseph gave proofs of considerable capacity. Languages, mathematics, war, and music were the studies to which he devoted most of his zeal. He participated in none of the campaigns of the 7 years' war, though this was waged in the years of his advanced youth, and though he admired no less the military glory of its hero, Frederic, than he did after its close his peaceful career. He successively married and lost without issue a princess of Parma and a princess of Bavaria. Made titular king of Rome in 1764, he became emperor of Germany on the death of his father in the following year; but this was then little more than an empty title, and in the hereditary possessions of his mother he received only the dignity of assistant without any real influence, though placed at the head of military affairs. Impatient of the inactivity to which he was doomed while wearing the crown of the Cæsars, Joseph at various periods undertook extensive travels incognito, traversing not only the countries which were to be ruled by his sceptre, Hungary, Bohemia, &c., but also non-Austrian Germany, Italy, Spain, Holland, and France. In the last named country, where his sister Marie Antoinette still shared the popularity of her royal husband, with whom she was destined also to share the scaffold, he was received with the admiration which naturally attached to a monarch who in his diet and dress imitated the frugality of a Marcus Aurelius, and who after the death of his father had burned his 22,000,000 florins of paper money, in order to restore his private inheritance to the state. In Germany he had an interview with Frederic in his camp at Neisse in Silesia, a province which that king

had wrested from the empire of Maria Theresa. Frederic in the following year (1769) repaid the visit at Neustadt in Moravia, where Joseph not only strove to display the perfections of his army, upon which he bestowed his principal cares, and into which he had introduced various liberal reforms, but also concerted with his guest the scheme, unparalleled in the history of diplomatic iniquity, of dismembering Poland, which was eagerly acceded to by Catharine II. of Russia, but somewhat reluctantly by the more conscientious Maria Theresa. This extraordinary act was executed in 1772, and added Galicia and the Zips to the empire of Austria. A few years later Bukovina was taken from Turkey. Bavaria, the elector of which died in 1777, was also to be annexed, but Frederic suddenly marched into Bohemia; and Joseph, who eagerly grasped the opportunity of measuring his strength with that of the renowned conqueror, was compelled by the order of the old empress peaceably to terminate the short struggle of succession. In 1780 he went to Mohilev to see Catharine, with whom schemes of Russian and Austrian aggression in Turkey and Italy respectively were agreed upon. Soon after his return his mother died, and the reign of the imperial philanthropist, so long impatiently looked for by liberal Europe, began. The long suppressed desire of totally transforming his empire and its nations, nourished by a love of the people, and a certainly not less ardent ambition, now found full satisfaction. Reform followed reform, radical changes were undertaken without hesitation, all prejudices spurned, all constitutional checks or historical considerations discarded. Equality, centralization, and uniformity were the leading principles. Serfdom was abolished, German was made the official language everywhere, new codes were introduced, the press was almost entirely made free, hundreds of convents, including 86,000 of the younger monks, were dissolved, and all others placed under the bishops; the bulls of the pope were made dependent upon the *placet regium*; the bulls *Unigenitus* and *In Vana Domini* were expunged from the Austrian rituals; and by the celebrated edict of toleration, which, however, excluded deists, the Protestants were set on a perfectly equal footing with the Catholics. All this was executed without consulting any legislative or deliberative body, and the private rights of individuals were as little considered as the privileges of classes, or the prejudices and ignorance of the masses. The people were to be enlightened and made happy by decrees, all obstacles violently removed, and the refractory punished. Pius VI., who personally repaired to Vienna, strove in vain to check or moderate the reformatory movement. But in the mean time the interests which had been so violently assailed by these changes, having their defenders in the most powerful and most influential classes of society, were active in preparing the overthrow of the new system. Nobles, priests, and patriots were united in secret opposition.

The dissatisfaction was most intense in Hungary, Brabant, the Tyrol, and Bohemia. In Transylvania a bloody rising of the Wallachian peasantry against the nobles, under Hora and Kloaka, was slowly suppressed (the enemies of the government said, not without intention) and most cruelly punished. Joseph's attempt to exchange the Austrian Netherlands for Bavaria was prevented by Frederic's last great act of external policy, the formation of the *Fürsten-Bund* (confederation of princes) in 1785. Unflinching amid all these difficulties, Joseph proceeded in his course of reform, and, eager to add military glory to the fame of his internal achievements, visited Catharine at Kherson during her triumphal progress through the southern regions of her empire (1787), and finally concerted with her the long meditated war against Turkey. It was soon begun. Joseph opened it by a sudden attack on Belgrade, but suffered a repulse, which was followed by the defeat at Lugos (1788), and other disasters. A part of the army was lost, when Joseph returned to his capital, with a fatal malady, while victory followed the banners of the Russian generals. Brabant, which had long been in open rebellion, declared its independence, Hungary was violently agitated, and it availed Joseph little that Laudon partially restored the fortunes of the war in 1789. The revolution in France brought new dangers. Broken in spirit, Joseph, shortly before his death, which was attributed by some to poison, abrogated all his innovating decrees (Jan. 1790), except that of toleration, and lived to witness the joy with which the downfall of the lofty edifice of his philanthropy and ambition was hailed by his subjects.

JOSEPH BONAPARTE. See BONAPARTE.

JOSEPHINE (MARIE JOSEPH ROSE TASCHE DE LA PAGÈRIE), empress of the French, 1st wife of Napoleon I., born at Trois Rets, near St. Pierre, Martinique, June 24, 1763, died at Malmaison, near Paris, May 29, 1814. Her father, whose family had emigrated from the vicinity of Blois, France, held the office of captain of the port at St. Pierre. She received the very imperfect education that was then imparted to young ladies in the French colonies; but her native grace and kindness of heart endeared her to all with whom she became acquainted. She was a great favorite among the black population in her neighborhood, and an old negro woman is reported to have foretold her future brilliant destiny. When about 15 years of age she was sent to France, and one year later, Dec. 13, 1779, married Viscount Alexandre de Beauharnais, like herself a native of Martinique, and then a major in an infantry regiment. By this union, which was far from being completely happy, she had a son, Eugène, afterward prince, and a daughter, Hortense, who became queen of Holland by her marriage with Louis Bonaparte, and was the mother of Napoleon III. Viscount de Beauharnais, although he had been one of the promoters of the revolution in the constituent assembly, and had faithfully served

his country in arms, was arrested upon suspicion during the reign of terror, and sent to the scaffold, July 28, 1794, leaving Josephine in distress. Her efforts to procure the release of her husband had caused her own imprisonment; and her two children were reduced to such extremities that Eugène entered a carpenter's shop as an apprentice. After the 9th Thermidor she was liberated through Mme. Tallien's influence, and became an ornament of the new society which was now forming. At Barras' receptions she met Bonaparte, then an obscure officer. He fell desperately in love with her, although he was 6 years her junior, and married her, March 9, 1796. Twelve days later he was appointed to the chief command of the French army in Italy. He wrote often to his wife during his campaigns, and in June, 1797, had her brought by his aide-de-camp Junot to Milan. She shared all the honors that were bestowed upon her husband either by the people or the directorial government, and was with great difficulty prevented from accompanying him to Egypt. During their separation certain personal enemies found means to make Bonaparte suspect his wife's fidelity, and he even resolved upon suing for a divorce on his return; but a single interview with Josephine revived all his passionate affection. After the 18th Brumaire she removed with Bonaparte to the Luxembourg, and afterward to the Tuileries; and while he pursued his campaigns she attracted to her court the distinguished men of the time of all political opinions, and by her affable disposition, generosity, and captivating manners, won universal respect and affection. She employed herself in behalf of the royalists, procuring the erasure of many names from the list of *émigrés*, and even saving the lives of those who conspired against the first consul. Her fondness for extravagant expenditure, far from diminishing her popularity, increased it, as it contributed to revive commerce, industry, and the arts; so that when Napoleon assumed the imperial title, the French nation hailed with enthusiastic applause the elevation of the "good Josephine." She was solemnly crowned, in Paris, on Dec. 2, 1804. But her happiness was soon marred by sad forebodings; she had no children by her imperial husband, and in the eyes of this great politician a direct heir was essential to the preservation of his power. After many struggles between his love and his ambition, Napoleon, partly by entreaties, partly by using his sovereign authority, prevailed upon his wife to consent to a divorce. The formal act of application was performed, with apparent sadness on his part, and dignified resignation on hers, Dec. 16, 1809, in presence of the arch chancellor and members of the imperial family. The divorce having been declared on the following day, evidences of national sympathy for the fallen empress showed that she was far from having lost any thing of her power over the French people, while her behavior commanded the admiration of even foreign princes. Her own enthusiastic attach-

ment to Napoleon remained unimpaired; and she would have been ready to follow him in his exile, when in his turn he fell from his throne, but their respective situations did not allow such a step. The esteem in which she was held by the allied sovereigns protected her during the disasters of 1814; she was several times visited at Malmaison by the emperor Alexander and the king of Prussia. But her health was now failing; and the anxieties to which she was a prey hastened her death, which was caused by an aggravated inflammation of the throat. Her remains were deposited in the church of Ruel, where a monument was erected in her honor. A statue of her was also inaugurated in 1859 at Fort de France, Martinique. The most important events in the life of this popular princess are faithfully narrated in Thiers' "History of the Consulate and the Empire," while her whole career has been chronicled by Joseph Aubenas in his recent *Histoire de l'impératrice Joséphine* (2 vols. 8vo., Paris, 1859). See also *Lettres de Napoléon à Joséphine pendant la campagne d'Italie, le consulat et l'empire* (Paris, 1827); and *Lettres de Joséphine à Napoléon et à sa fille* (Paris, 1838). The *Mémoires de Mlle. Lenormand sur Joséphine* have little value; those of Mme. Avrillon (3 vols., Paris, 1831) deserve more credit.

JOSEPHUS, FLAVIUS, a Jewish historian, born in Jerusalem in A. D. 37, died about 100. His father belonged to the highest sacerdotal family, and his mother was descended from the Asmonean princes. He received a superior education, was often consulted even from his 15th year by eminent men on recondite questions of the Jewish law, and acquired an extensive acquaintance with Greek literature. He studied with great care the doctrines of the 3 Jewish sects, and passed 8 years in the desert with the ascetic Essenes, after which he remained by creed as by birth a Pharisee. At the age of 26 he was sent to Rome to plead the cause of some Jewish priests arrested by the procurator Felix, and, escaping from a shipwreck on his way, was introduced to Poppæa, the wife of Nero, and not only effected the liberation of his friends, but received many presents from the empress. Returning to Jerusalem, he attempted to dissuade the Jews from the revolt on which they were bent, but failing in his efforts he joined the war party, though, knowing well the resources of Rome, he was convinced that the struggle could only end in the ruin of his country. He was appointed one of the generals and deputed to defend the province of Galilee, and he made vigorous and for a time successful preparations against the Romans, though vehemently opposed by a strong party in the council at Jerusalem led by John of Giscala. On the approach of Vespasian in 67 he threw himself into Jotapata, the strongest of the Galilean cities, where he maintained a desperate resistance for 47 days. Escaping from the massacre which succeeded its fall, he took refuge in a cave, but was betrayed to the

Romans. He thereupon assumed the character of a prophet, and, professing to derive his knowledge from the sacred books of the Jews, announced to Vespasian that the Roman empire should one day be his and his son's. Confidence in him was increased by the discovery from prisoners that he had foretold the exact number of days that the siege of Jotapata should last. He was not, however, released from bonds till, Vespasian having become emperor, Titus succeeded to the control of the Jewish war. He was present at the siege of Jerusalem, suspected as a traitor by both Jews and Romans, and accompanied Titus on his return to Rome, where he passed the remainder of his life in literary pursuits. He was presented with the freedom of the city, an annual pension, and a house which had formerly been an imperial residence. He was 8 times married, and was divorced from his first 2 wives. Pride in the ancient glories of his nation, awe of the greatness and power of Rome, personal vanity, and a tendency to unbounded flattery of the Flavian family, appear with equal prominence in his writings. In a much disputed passage he alludes to Christ as something more than man, to his miracles, Messiahship, death, and resurrection in accordance with the prophecies; but there is no evidence that he was a Christian. His principal works are: a "History of the Jewish War," written in Hebrew, translated by himself into Greek, and published about 75; and a treatise on "Jewish Antiquities," completed about 98. The Hebrew original of neither of them is extant. The former extends from 170 B. C. to the fatal war which terminated in the destruction of Jerusalem, of which it gives a detailed narrative; and the latter includes the period from the creation to A. D. 66, and manifests a desire to conciliate heathen readers. He also wrote his own biography, and a treatise against Apion on the antiquity of the Jewish nation. An account of the martyrdom of Eleazer, and of 7 youths and their mother, entitled *Etz Makkasaiours*, has been ascribed to him, but is of doubtful genuineness. The best editions of his works are by Hudson (Oxford, 1720), Havercamp (Amsterdam, 1726), and Dindorf, in Didot's *Bibliotheca Græca* (Paris, 1845). The principal English translations are by Lodge (1602), L'Estrange (1702), Whiston (1737), and Dr. Robert Traill, who died, leaving finished only "The Jewish War," which was edited by Isaac Taylor (2 vols., London, 1847.)

JOSHUA, the successor of Moses in the command of the Israelites, born about 1537, died about 1427 B. C. He was the son of Nun, of the tribe of Ephraim. He gained the victory over the Amalekites at Rephidim, accompanied Moses to Mt. Sinai, was deputed with 11 others to explore the land of Canaan, was appointed by Moses with the divine sanction to the command of the Israelites, led them into the promised land, and divided the country among the tribes. He governed Israel during 25 years, and his history is contained in the canonical books of

Joshua, of which he has usually been regarded as the author, though some late critics suppose it to have been written either in the time of David, or near the Babylonian exile. There is a Samaritan book of Joshua (published in Arabic and Latin by Jwynboll, Leyden, 1848), which is a chronicle of events from the death of Moses to the time of Alexander Severus.

JOSIAH, the 17th king of Judah, son of King Amon, born in 647, succeeded to the throne in 639, died in 609 B. C. Unlike his immediate predecessors, he did right in the sight of the Lord, and undertook to free the land from idolatry, though the groves and altars consecrated to idol worship were favored by men of rank and influence in the kingdom. Having accomplished this purpose in the 18th year of his reign, he proceeded to repair and adorn the neglected temple of the Lord. In the sanctuary there was found a volume containing the books of Moses, which seems to have been regarded as the original copy of the Mosaic law. Soon after this he ordered the celebration of the pass-over with a care and magnificence unexampled from the time of the judges. Being tributary to the Babylonian empire, he resisted the passage through his territories of the Egyptian king Pharaoh-necho, on an expedition against the Chaldeans, and fell in the battle of Megiddo between the Hebrew and Egyptian forces.

JÓSIKA, MIKLÓS, baron, a Hungarian novelist, born in Torda, Transylvania, in 1796. He studied law, and in 1812 entered the Austrian army, which he left in 1818 with the rank of captain of cavalry. Having married, he lived alternately on his estates in Transylvania and in Pesth, chiefly engaged in literary pursuits, but also active as a member of the liberal opposition party of his country. After the reunion of Transylvania with Hungary in the spring of 1848, he became a member of the upper house of the Hungarian diet, was a decided supporter of Kossuth, and on the resignation of the Batthyányi ministry was appointed member of the committee of defence. He followed the revolutionary government to Debreczin, and after its overthrow effected his escape to Brussels, where he still resides, continuing his activity as an author. Condemned to death in his absence, he was hanged in effigy in Pesth in 1851. Jósika is one of the most popular and prolific writers of his country; among his most remarkable works are the historical novels *Abafi* (1836, 8d ed. 1851), *A utolsó Báthori* ("The Last of the Báthoris"), *A Csehok Magyarországon* ("The Bohemians in Hungary"), *Zrínyi a Kőltő* ("Zrínyi the Poet"), *Jósika István* ("Stephen Jósika"), and *Esther* ("Esther," 1858); all translated into German, partly by Klein, partly by the author's second wife Julia Podmaniczky, whom he married in 1847. His more recent publications, written in exile, have appeared anonymously.

JOST, ISAAK MARCUS, a German author of Jewish birth, born in Bernburg in 1793. He studied at Göttingen and Berlin, was appointed teacher in the latter city in 1816, and in 1835

principal teacher of the Jewish *Realschule* in Frankfort-on-the-Main, which position he still holds. He has written numerous historical, linguistic, and other works. His best known publications are: *Geschichte der Israeliten* (9 vols., Berlin, 1820-'28); *Allgemeine Geschichte des jüdischen Volkes* (2 vols., 1832); *Neuere Geschichte der Israeliten* (3 vols., 1846-'7), containing the history of the Jews since 1815; and *Geschichte des Judenthums* (3 vols., Leipzig, 1857-'9). He has translated the Mishna into German (6 vols., 1832), and in 1839-'51 edited the *Israelitische Annalen* (Frankfort).

JOTUNS, JOTNEN, or JETTEN, in Scandinavian mythology, giants, representing the rude powers of nature, and in some respects corresponding to the Titans of the Greeks. They were fabled to inhabit Nifheim, the region of darkness, cold, and ice, and to wage continual war with the Asen, or gods who symbolized the more genial elements, such as light, warmth, and vegetation. From Ymer, first of the Jotuns, the world was made. The ice in Nifheim having been melted by the sun rays from Muspelheim (the land of light and heat), the thaw gave birth to the first Jotun Ymer, and to the cow Ardmbla, which by licking the salt rocks generated the first man Bure. From himself Ymer begot the giant race of the Hymthussen, but was shortly after slain by Odin, Wila, and We, Bure's grandsons. His blood became the sea, his flesh the earth, his bones the rocks and mountains, his skull the heavens, his brain the clouds, and his eyebrows the ramparts defending Midgard, the home of men. In a historical point of view the Jotuns appear to have been the aboriginal inhabitants of the north of Europe, who long maintained a contest with a later wave of immigration from the East in Odin and his companions. According to northern fable, the Jotuns were mighty giants controlling the ruder forms of nature, and inhabiting caves. Their sons were mighty rivers and floods, and their daughters clear, rippling brooks, often so beautiful as to win the love of the highest among the gods. Regarding the Jotuns in the light of men, they were probably the same race as the Thussen or Thursen, and belonged to the nation of the Finns.

JOUFFROY, THÉODORE SIMON, a French philosopher, the greatest moralist of the eclectic school, born in the hamlet of Les Pontets, Doubs, July 6, 1796, died in Paris, Feb. 4, 1842. After attending the college of Nzeroy, he was confided in 1807 to the care of his uncle, an ecclesiastic and professor in the college of Pontarlier, with whom he remained 4 years, and was then transferred to the college of Dijon. Rollin was the first author in whom he took delight, and history continued through his life to be a constant and favorite study. He had already attempted a tragedy, when in 1814 he was selected as a brilliant pupil for admission into the normal school. Theological meditations had led him to the highest problems, and he describes himself as at this time uncertain

about the enigma of human destiny, yet detesting incredulity, and resolute to solve the question by the light of reason, since he had lost that of faith. He was thus in a condition to be strongly impressed by the youngest of his masters, Victor Cousin, whose eloquent lectures decisively directed his vocation to philosophy. In 1817 he became pupil-assistant in the philosophical department of the normal school, at the same time lecturing in the Bourbon college, and fulfilled both tasks till his health obliged him to resign the latter in 1820. By the suppression of the normal school in 1822, he was deprived of public employment for 5 years, and in the interval he delivered a private course of lectures, attended by the élite of the young men of the capital; published philosophical articles in the *Globe* and other journals and reviews, one of which, entitled *Comment les dogmes finissent*, added much to his reputation; translated the "Moral Philosophy" of Dugald Stewart (Paris, 1826), to which he furnished an elaborate preface; and began his translation of the complete works of Thomas Reid (6 vols., Paris, 1828-'35), to which he added several of the lectures of Royer-Collard, and a preface in which he undertook a complete examination of the Scotch philosophy. In 1828 he was made assistant professor of ancient philosophy in the faculty of letters of Paris, and, interested rather in philosophy than its history, treated of the faculties of the soul in a course of lectures on the first "Alcibiades" of Plato; and in 1830 became adjunct professor of the history of modern philosophy, and delivered his *Cours du droit naturel* (2 vols., 1835; a 3d vol. was edited after his death by Damiron, 1849), his most eloquent work, which treats at once of ethics, psychology, and theodicy. In 1831 he was elected to the chamber of deputies, and in 1833 was appointed to the chair of Greek literature and philosophy in the college of France, and elected to the academy of the moral and political sciences. In 1835 he was obliged to abandon his various duties to seek a restoration of his health in Italy, and on his return in 1838 resigned his professorship in the college of France to succeed Larmignière as librarian of the university. His feeble voice and calm and methodical mind alike unfitted him to excel in the chamber of deputies, though from his abilities and personal character he always commanded attention. In 1840 he was called into the royal council of public instruction, and, being appointed to draw up the address of the new ministry, maintained that its administration should be distinguished by some broad difference from that which had preceded it. Finding himself in a minority, his disappointment had a fatal influence on his already broken health. He languished till his death, in serenity and firmness of mind, seeking complete solitude; only his wife and children were allowed to approach him, the blinds of his windows were closed and the light excluded, and he remained to the last as if in calm and deep meditation. As a metaphysician, Jouffroy

adopted and hardly went beyond the psychological standpoint of the Scotch school. One of his most original theories is his distinction between the psychological and the physiological life, or the personal and impersonal life, different from that ordinarily made between the soul and body. The former is an extraordinary original power, directing our natural capacities, and moulding our whole existence to the intelligent accomplishment of its existence; the latter is human nature as subjected to its necessary laws and impulses. Every faculty that we possess is regarded as being developed either, on the one hand, according to the necessary laws of human nature, or, on the other hand, under the sway and direction of our personal power. These faculties he thus classifies: the personal faculty, imperfectly designated by the name of liberty or will; the primitive inclinations, or the aggregate of natural instincts or tendencies, prior to all experience; the locomotive faculty; the expressive faculty; sensibility; and the intellectual faculties. As a moralist, he has given a peculiar explanation of good and evil. Every thing is good in proportion as it aids in the fulfilment of our destiny. The problem of human destiny therefore lies at the foundation of morality. There can be no *à priori* judgment as to the moral quality of actions, since that is relative to the agent, depending on the influence they may have on the destiny for which he was created. Good, in the case of any particular being, is the fulfilment of its own specific destiny; good, in itself, is the fulfilment of the destiny of all beings; and an interruption in the accomplishment of destiny constitutes evil. The style of Jouffroy is remarkably clear, forcible, and elegant, and his writings have great literary merit irrespective of their philosophical contents. His principal works, not already mentioned, are the *Mélanges philosophiques* (1838), containing 28 essays, most of which had before appeared in periodicals; the *Nouveaux mélanges philosophiques*, edited by Damiron (1842); and the *Cours d'esthétique*, also edited by Damiron (1848). His *Cours du droit naturel* has been translated into English under the title of an "Introduction to Ethics," by W. H. Channing, and a selection from his essays under that of "Philosophical Miscellanies," by G. Ripley, in Ripley's "Specimens of Foreign Literature" (Boston, 1888-'40).

JOURDAN, JEAN BAPTISTE, count, a French general, born in Limoges, April 29, 1762, died in Paris, Nov. 23, 1833. He enlisted in the army when scarcely 16 years old, served 5 years in America under Count d'Estaing, and was discharged in 1784. He then became a merchant's clerk, and had married a milliner and adopted her business when the revolution broke out. He became a lieutenant of the national guards, and was in 1791 elected to command a battalion of volunteers; he joined the army of the north, distinguished himself in Belgium under Dumouriez, was appointed brigadier-general in 1793, and 4 months later promoted to

the rank of general of division. Wounded at the battle of Hondschoote, he had scarcely recovered when he was placed in command of the army of the north. He drove the imperial troops from their position at Wattignies, Oct. 16, 1793, and was called to Paris to consult with the committee of public safety; but being unexpectedly placed on the retired list, he returned to his shop at Limoges. But his services could not well be dispensed with, and on April 15, 1794, he received the command of the army of Moselle. A few days later he was transferred to that of Sambre-et-Meuse, with which he won (June 26) the celebrated battle of Fleurus, executed several other successful operations, and drove the Austrians beyond the Rhine. In 1795 he displayed uncommon talents in crossing that river. In 1796 he advanced into Germany, and defeated Orléans at Altenkirchen; but being subsequently worsted near Würzburg by the archduke Charles, he was obliged to fall back, and resigned his command. In 1797 he was elected to the council of 500, where he procured the adoption of the law of military conscription. He was president of that body in Oct. 1799, when he resigned his legislative functions to assume the command of the army on the Danube. After a short and unsuccessful campaign, he returned to Paris, was re-elected to the council of 500, refused to participate in the plans of Bonaparte for the subversion of the directorial government, and was one of the members excluded from that body on the 19th Brumaire. He nevertheless was sent by the first consul on a special mission to Piedmont, and reconciled that country to the French domination. He was appointed marshal of the empire and grand eagle of the legion of honor in 1804, but received no important command. He lived in comparative inactivity until he was appointed in 1806 governor of Naples, and became the principal adviser and friend of Joseph Bonaparte. He accompanied Joseph to Spain, with the title of major-general of the armies of his Catholic majesty; but he had, as such, neither authority nor influence, and was not answerable for the reverses of the French armies in the Peninsula from 1808 to 1813. He was treated by Napoleon with a coldness amounting to disgrace. In 1814, having assented to the deposition of Napoleon, he received a peerage from Louis XVIII. He joined Napoleon during the Hundred Days, but on his defeat at Waterloo went back to the Bourbons, was created a count, then governor of the 7th military division, and in 1819 peer of France. On the revolution of July, 1830, he held for a few days the ministry of foreign affairs, and was appointed by Louis Philippe governor of the Invalides. He was an honest man, and died poor.

JOURNALISM. See NEWSPAPERS.

JOUSSOUF, or YUSUF, a French general, born either on the coast of Provence or in the island of Elba, between the years 1807 and 1810. Kidnapped, when a mere child, by corsairs, he was taken to Tunis and sold to the bey, who

had him educated according to the Mohammedan creed and placed him in his body guard. A love affair with the daughter of his master exposed him to imminent danger, escaping from which he took refuge on board a French brig, landed at Algiers in 1830, enlisted in the French army, and soon reached the rank of captain in the 1st regiment of *chasseurs d'Afrique*. In 1831 he was intrusted, as an interpreter, with several perilous missions, which he successfully performed. In 1832 he took part in the capture of Bona, which he held with desperate valor. He distinguished himself in the expedition against Tiemcen in 1836, and received the title of "bey of Constantine." In 1837 he repaired to Paris, where his romantic reputation and handsome person made him a "lion" in the highest society. On his return to Africa, he served as lieutenant-colonel of spahis from 1838 to 1841, and then as colonel commanding the irregular cavalry in 1842. He participated in nearly every campaign under Marshal Bugeaud, who appointed him brigadier-general on the battle ground of Isly. On his second visit to Paris, in 1845, he embraced the Christian faith and married a niece of Gen. Guilleminot. Resuming active service, he distinguished himself in various encounters with Abd el Kader, took part in the Laghouat expedition in 1852, commanded the division of Algiers in 1855, and finally figured conspicuously in 1857 in the invasion of Kabylia under Marshal Randon.

JOUST. See TOURNAMENT.

JOUY, VICTOR JOSEPH ÉTIENNE DE, a French author and journalist, born in 1764 in the village from which he derived his name, died in St. Germain-en-Laye in 1846. Having enlisted in the army when a boy, he went to South America, and then to India, where he was introduced to Tippoo Sahib, and met with some remarkable adventures. He afterward participated in the first campaigns of the French revolution, reached the rank of major, found himself involved in several difficulties, and at the age of 33 was placed on the retired list. He now devoted himself entirely to literature, produced several light comedies, and in 1807 gained considerable reputation by *La vestale*, a lyric poem, set to music by Spontini; this performance 8 years later was rewarded with one of the great decennial prizes. He continued his efforts in the same line, composing the libretti for Spontini's *Fernand Cortez* (1807), Catel's *Les bayadères* (1810), Cherubini's *Les Amazones* and *Les Aventures* (1812-'13), and Rossini's *Moïse* (1827) and *Guillaume Tell* (1829). He also attempted tragedy. His *Tippo-Sahib* was performed in 1813; *Sylla*, for which Talma's acting, and especially his wonderful resemblance to Napoleon, secured a remarkable success, in 1821; *Bélisaire* in 1825; and *Julien dans les Gaules* in 1827. Jouy was meanwhile an active contributor to several periodicals. A series of his sketches was collected in 1812 under the title of *L'hermite de la chaussée d'Antin*, which was compared with Addison's "Spectator." Under

the restoration he took an active part in politics, and held a high rank among the opposition journalists, being one of the principal writers for the *Constitutionnel*. His attacks brought the wrath of the government upon him and his friend Jay; both were incarcerated for a few months, which considerably added to their popularity, and was the occasion of their publishing *Les hermites en prison* (1823) and *Les hermites en liberté* (1824). After the revolution of July, 1830, he was appointed librarian at the Louvre by Louis Philippe, who granted him also in his later years an apartment in the chateau of St. Germain. He published his own *Œuvres complètes* (27 vols. 8vo., Paris, 1823-'7).

JOVELLANOS, or JOVE-LLANOS, GASPARE MELCHIOR DE, a Spanish statesman and poet, born in Gijón in Asturias in 1744, died Nov. 27, 1811. While yet a youth he is said to have been learned to a remarkable degree in law, languages, history, antiquities, and literature. In 1767 he was appointed a judicial magistrate at Seville, and in 1778 was called to Madrid as one of the principal magistrates of the capital and court. In 1780 he was raised to a place in the "council of orders," where he soon proved himself to be the first philosophical statesman of Spain. While Charles III. lived Jovellanos exercised great influence, but after the death of that monarch in 1788 court cabals and enemies attacked him with violence. He proposed a tax on the higher clergy, to fill the treasury exhausted by the war against the French republic, and this proved the cause of his exile in 1790 to the mountains of Asturias. He was recalled in 1797 and made minister of justice, but in the next year he was again sent to Asturias by the intrigues of Godoy, who hated and feared him. In 1801 he was banished to the island of Majorca. He recovered his liberty in 1808, on the fall of Godoy, was elected member of the supreme junta, and was offered by King Joseph the ministry of the interior, which he declined. His native city being occupied by the French, he took refuge on a small vessel, and after a stormy passage of 8 days arrived at Vega, where he died within 48 hours after landing. "Jovellanos left behind him," says Mr. Ticknor, "few men in any country of a greater elevation of mind, and fewer still of a purer or more irreproachable character." Among his works are the *Memoirs politiques*, which have been translated into French, many important political and statistical memoirs, and a collection of poetry, containing *El delincuente honrado*, a comedy, which had great success in Spain, and which has been translated into French and English, and frequently played in Paris and London.

JOVIANUS, FLAVIUS OLAUDIVS, Roman emperor, died in 364, after a reign of 7 months. He was the son of Varronianus, one of the greatest generals of his age. He was captain of the body guards of the emperor Julian, and participated in his fatal campaign against the Persians. After the fall of Julian, he was proclaimed emperor by the legions, and declared

himself a Christian. His army was in the midst of a hostile country, from which his first care was to extricate it. But Sapor, the Persian monarch, so harassed his march with repeated attacks, that Jovianus, to save his army from destruction, consented to an ignominious peace, which restored to the Persians all the possessions wrested from them by Julian. On reaching the Roman territory, the emperor caused an edict to be issued which forbade the persecution of Christians, and restored the supremacy of their religion; but he would not permit the pagans to be oppressed on account of their belief. On the way to Constantinople he arrived, Feb. 16, 864, at Dadastana, an obscure village of Galatia, where he was found dead in his bed the next morning—whether suffocated by a charcoal fire with which the room had been warmed, or overcome by intemperance, or the victim of poison, is uncertain.

JOVIUS, PAULUS. See GIOVIO.

JUAN FERNANDEZ, or MAS-A-TIERRA, an island in the S. Pacific, about 400 m. from the coast of Chili, to which it belongs, in lat. 38° 40' S., long. 79° W.; pop. about 40. It is 15 m. in length and 6 in breadth; area, nearly 65 sq. m. The surface is in general rugged and mountainous, but the valleys are numerous and fertile. The climate is pleasant and healthful. The principal productions are oats, turnips, apples, strawberries, melons, peaches, figs, sandal wood, and cork. Wild goats are also abundant, while large quantities of excellent fish are taken off the coast. There is a safe and convenient harbor on the N. E. side of the island, which is much frequented by vessels as a watering station. The loftiest of its mountains is Yungue, whose summit is nearly 4,000 feet above the sea. Juan Fernandez has been leased by the Chilean government to a company who catch and prepare fish there. In the 16th and 17th centuries it was a favorite resort of the buccanniers. In 1704, Alexander Selkirk, a Scotchman, who was sailing master of the *Cinque Ports*, an English privateer, was put ashore here at his own request, well supplied with clothing, instruments, and arms, and remained in solitude till 1709. His story is commonly said to have been the foundation of Defoe's "*Robinson Crusoe*," and Juan Fernandez is often termed Robinson Crusoe's island. But from the title of Defoe's romance, which in consequence of its length is abridged in the modern reprints, and from the details given in the narrative itself, it has been inferred that Robinson Crusoe's island was not in the Pacific, but on the N. coast of South America near the mouth of the Orinoco. The full title begins as follows: "*The Life and strange surprising Adventures of Robinson Crusoe, of York, mariner, who lived eight and twenty years all alone in an uninhabited island on the coast of America near the mouth of the great river Oroonoke, having been cast on shore by shipwreck*," &c. The real prototype of Robinson Crusoe may therefore have been Peter Serrano, a Spaniard who was wrecked on

an island in the Caribbean sea, not far from the mouth of the Orinoco, in the 16th century, and lived there many years in solitude, and was finally taken off by a passing vessel. An account of his adventures is given in Sir Paul Rycaut's translation of Garcilasso's "*Commentaries of Peru*," which was published in London a few years before "*Robinson Crusoe*" was written, and was a popular and conspicuous book, which could not have escaped Defoe's notice.

JUANES, JUAN BAUTISTA, sometimes incorrectly called Vicente Joannes, a Spanish painter, born in Valencia in 1523, died in Bocairente near Valencia in 1579. The Spanish writers rank him with the great artists of the age of Leo X., and style him the Spanish Raphael. His subjects were all selected from sacred history. His *chef d'œuvre* is the "*Baptism of Christ*," in the cathedral of Valencia.

JUAREZ, BENITO, a Mexican president, born in 1807 in a village near Jatlan, at present known as Villa Juarez, in the state of Oajaca. He is descended from pure aboriginal stock, and was born in humble circumstances. At an early age he was received into the service of a wealthy family of Oajaca, who assisted him in his education. Afterward he prepared himself for the profession of the law, in which he gained distinction. Devoted to liberal ideas, he took an active part in politics as a member of the legislature of his native state. He successively went through the whole range of the judicial organization of his state, from the position of justice of the peace to that of presiding judge. In 1846 he was elected deputy to the constitutional congress in the city of Mexico. He took a very prominent part in the administration of the law known in Mexico by the appellation of *manos muertas* (mortmain), by which a loan was imposed upon the clergy to supply the necessities of the existing war with the United States. From 1848 to 1852 he officiated with success as governor of his native state. During the period of peace he devoted himself to the opening of roads, the increase of primary and higher schools, and the reform of the financial administration; and on retiring from the government, he left in the public treasury a considerable sum of money. In 1853, under the administration of Santa Anna, he was banished from the country, spent a short time in Havana, and thence proceeded to New Orleans, in which city he resided until April or May, 1855, when he left it for Acapulco to join Alvarez, whom he accompanied to Cuernavaca. In that city he discharged the functions of representative of the state of Oajaca in the assembly empowered to choose a temporary president of the republic. Alvarez was selected, and Juarez became minister of justice. While in this office he promulgated the law abolishing the privileges of the clergy and the army which is known as the *ley Juarez*. Alvarez having retired from the presidency in Dec. 1855, after having appointed Gen. Comonfort as his substitute, Juarez left the cabinet in conjunction with all the other ministers. Comonfort then

appointed him governor of Oajaca, the administration of which office he assumed when the revolution which had broken out there rendered the discharge of his mission very difficult. He succeeded, however, in effecting the immediate pacification of the state, and sent forth armed forces for the reestablishment of order in other parts of the republic. The term of the provisional administration having expired by the promulgation of the constitution of 1857, he was elected constitutional governor of the state of Oajaca, and was in the discharge of the duties of this post when, in Nov. 1857, President Comonfort made him secretary of state, and subsequently he was appointed president of the supreme court of justice. After the withdrawal of Comonfort from the government (Jan. 1858) Juarez became, in virtue of his office, constitutional president of Mexico. On Jan. 19 he established his government in Guajuato. The reverses of civil war afterward compelled him to remove it to Colima. As in this city he was separated from the rest of the republic—which recognized the constitutional government, with the exception only of the city of Mexico and 3 or 4 others, in which the so called conservatives had large garrisons—he determined to proceed by way of Panama to Vera Cruz, and arrived there on May 4, 1858, where he has since officiated as the head of the constitutional government.

**JUARROS**, DOMINGO, a Central American ecclesiastic, synodal examiner of the archbishopric of Guatemala. He is the author of a history of Guatemala, entitled *Compendio de la historia de la ciudad de Guatemala*, in 6 books (Guatemala, 1800-'18). It embraces accounts more or less complete of the 5 ancient provinces (now republics) of Central America, viz.: Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica.

**JUBA**. I. King of Numidia, son of Hiempsal (who had been restored to his throne by Pompey), died by his own hand in 46 B. C. Juba succeeded to the throne on the death of his father, and in the conflict between Cæsar and Pompey he sided with the latter, both from enmity to Cæsar, with whom he had quarrelled on an official visit to Rome during his father's lifetime, and from friendship for the man to whom his father owed his crown. The moment Curio, Cæsar's lieutenant, landed in Africa (49 B. C.), Juba hastened to the succor of Attius Varus, the commander of Pompey's forces. Varus had already been defeated by the Cæsareans under the walls of Utica; but on the approach of Juba, Curio retreated and assumed a strong post near the sea. He was drawn from his position by a stratagem, and overthrown, himself being slain, and his army almost cut to pieces. Juba sullied the glory of this victory by cruelty, causing some cohorts of cavalry who had surrendered to be massacred. He enjoyed his kingdom in peace till 46 B. C., when Cæsar arrived in Africa to crush the last remnant of the Pompeian faction. Then Bocchus,

king of Mauritania, was incited to invade Juba's dominions, and a Roman force was sent to cooperate with him. He heard of their inroad while on the way to join Scipio, the Pompeian commander, and turned against them, but finally went to Scipio's aid. The rival hosts encountered at Thapsus, and the result proved fatal to the Numidian and his allies. Juba, fleeing from the field, wandered about for a few days as a fugitive, and then in despair killed himself. After his death his kingdom was formed into a Roman province, of which Sallust was the first governor. II. King of Mauritania, son of the preceding, died about A. D. 18. He was a child at the time of his father's death, fell into the hands of the conquerors, and was carried prisoner to Rome. He was brought up and educated in Italy, and ultimately became one of the most learned men of the age. Augustus, whom he accompanied to the East, formed a high opinion of him, and at the settlement of affairs subsequent to his return to Rome, he restored to him his paternal kingdom, and gave him the daughter of Antony and Cleopatra in marriage. At the request of his patron, however, he afterward exchanged Numidia for the two provinces of Mauritania, and some portion of the Gætulian territory. Few of the details of his life are known. In the reign of Tiberius he was obliged to call in the Romans to repress the desert tribes. He was the author of valuable works in almost every department of knowledge, but all have perished save their titles and a few brief extracts. The most important of them were a "History of Africa," based principally on Carthaginian authorities; a "History of Assyria;" a "History of Arabia;" a treatise on "Roman Archaeology;" a "History of Theatres;" a "History of Painting and Painters;" and two treatises on botany and medicine.

**JUBILEE**, a Hebrew festival, celebrated every 50th year. According to the Hebrew ritual, every 7th year as well as every 7th day was observed as a period of rest. To avoid the difficulty of supposing two successive years to be thus observed, some critics have endeavored to prove that the year of jubilee was the 49th instead of the 50th. During this year there was neither sowing nor reaping, all depending alike on the spontaneous products of the earth. Slaves became free, and every one resumed possession of his inheritance, however it had been alienated. Unlike the sabbatical year, however, the jubilee did not annul debts. The design of this institution was to check the rise of any great inequality of social condition, and to prevent the rich from oppressing and enslaving the poor, or from appropriating their lands. It also strengthened the bonds of families, and bound the people to their country, by leading them to cherish an affection for estates derived from their ancestors and to be transmitted to their posterity. The jubilee did not continue to be observed after the Babylonian captivity.—In the middle ages, the term was applied to the year in which all who visited the church

of St. Peter at Rome for a certain number of days with pious offerings received plenary indulgence. A jubilee was first declared by Pope Boniface VIII. in 1800, and was to recur every 100 years. The time was limited by Clement VI., Urban VI., and Paul II. respectively, to 50, 88, and 25 years, and the last period still remains the ordinance of the Roman Catholic church. The condition of visiting Rome is no longer in force, certain works of charity or devotion being substituted for it.

JUDÆA, in ancient geography, is variously used to designate the whole of Palestine or the land of the Jews, especially during the period between the Babylonish captivity and the last wars of the Jews; the southern kingdom of the Hebrews, or that of Judah, in contradistinction to that of the 10 tribes or of Israel; or the southern division of Palestine W. of the Jordan in the time of the Asmoneans and Romans, between Samaria on the N., the Jordan and the Dead sea on the E., Idumæa and the desert on the S., Egypt on the S. W., and the Mediterranean on the W. The limits of Judæa in each of these acceptations were continually varying. (See PALESTINE, and HEBREWS.)

JUDAH (Heb. *Jehudah*). I. The 4th of the sons of Jacob by Leah, founder of the most numerous of the tribes of Israel, which, having received all the land bounded by Dan, Benjamin, the Dead sea, Idumæa, Simeon, and the Mediterranean, became powerful under the dynasty of David, which originated in one of its towns, Bethlehem, and, after the division of the Hebrew state into two kingdoms, the principal member and representative of the southern, named after it. After the destruction of the northern kingdom by the Assyrians, Judah became the common name of the Hebrew nation in general, and the name Jews (Heb. *Jehudim*, Lat. *Judei*) is derived from it. Jerusalem, the capital of the united state, and afterward of the southern division, was situated within the limits of the tribe of Judah, on the confines of Benjamin. The mountain of Judah was a range traversing its centre, and the desert of the same name near its southern boundary. II. Surnamed HAKKADOSH (the Holy), a celebrated rabbi of the 2d century, of the house of Gamliel, and one of his successors as *nasi* (patriarch), was the principal author of the Mishna. He was a friend of one of the Roman emperors, whom Rapoport, the most competent critic on the subject, identifies with Marcus Aurelius. III. HALLEVI, or HA-LEVI (the Levite), a Spanish rabbi of the 12th century, called as an Arabic writer ABUL HASSAN. He distinguished himself as a physician, philosophical theologian, and poet, in the latter capacity being unsurpassed, if not unequalled, by any post-biblical writer in Hebrew. Shortly before the middle of the 12th century he made a pilgrimage to the land of his fathers, a part of which he sings in glowing strains of pious devotion; but before reaching the holy city every trace of him is lost. According to a tradition he was killed by a

Mussulman before entering its gate. His principal work is the *Khusari* ("The Khazar"), a vindication of the truth and exposition of the principles of Judaism, in fictitious discourses on religion between a king of the Khazars (who was converted to that faith about 4 centuries before the time of the author) and a rabbi. It was translated from the Arabic into Hebrew by Judah ben Tibbon, into Latin by Buxtorf, and also into Spanish and German. His songs, which among others contain the gems of Hebrew liturgical poetry, have found numerous translators and editors, among the most recent of whom are Luzzatto, Sachs, Dukes, and Geiger (*Der Divan des Castiliens Abul-Hasan-Judaha-Levi*, Breslau, 1851). His elegy on Zion was translated into German by Mendelssohn.

JUDAS ISCARIOT, one of the 12 apostles, the betrayer of his master. He was the son of Simon, was appointed treasurer of the apostles, covenanted with the chief priests to deliver Christ up to them for 80 pieces of silver (at the highest computation about 22 dollars), accomplished this purpose, repented when he saw his Lord condemned and buffeted, offered to restore the money, confessed that he had betrayed innocent blood, and in despair committed suicide, hanging himself according to Matthew, falling and bursting asunder according to Luke. Many interpreters suppose that the motive of his betrayal was to oblige Jesus, in self-defence, to announce himself as the expected king Messiah, to surmount the emergency by his miraculous powers, and to open to himself, the apostles, and the Jewish kingdom the anticipated career of aggrandizement. "The difference," says Archbishop Whately, "between Iscariot and his fellow apostles was, that though they all had the same expectations and conjectures, he dared to act on his conjectures, departing from the plain course of his known duty to follow the calculations of his worldly wisdom and the schemes of his worldly ambition."—See Whately's "Discourse on the Treason of Judas Iscariot," in his "Essays on Some of the Dangers to Christian Faith" (London, 1839).

JUDAS MACCABÆUS. See HEBREWS.

JUDD, SYLVESTER, an American author and clergyman, born in Westhampton, Mass., July 23, 1813, died in Augusta, Me., Jan. 20, 1853. He was graduated at Yale college in 1836, and subsequently embraced the Unitarian creed. He entered the divinity school of the university at Cambridge in 1837, completed his theological studies in 1840, and was ordained as pastor of the East parish in Augusta, Me., on Oct. 1. In 1843 he began the work on which his literary reputation chiefly rests, "Margaret, a Tale of the Real and Ideal," &c. (12mo., Boston, 1845), which has been illustrated by a series of outline drawings by Felix O. O. Darley (New York, 1856). In 1850 he published "Philo, an Evangelist," a didactic poem in blank verse, and in the same year "Richard Edney," a romance. An old Indian tradition suggested to Mr. Judd a dramatic poem in 5 acts, "The White Hills, an

American Tragedy," still unpublished. A volume entitled "The Church, in a Series of Discourses," was published posthumously in 1854; and his "Life," by Mrs. Arethusa Hall, was published in the same year.

**JUDE, SAINT,** surnamed **THADDEUS** (the zealot), or **LEBBEUS**, one of the apostles, a relative of Jesus, probably a son of Alphaeus and brother of James the Less. No circumstances of his life are related. According to the traditions of the West, he preached and suffered martyrdom in Persia. According to eastern traditions, he labored in Arabia, Syria, and Palestine, and died in Edessa; or, according to others, visited Assyria also, and died in Phoenicia. He is commemorated in the western church on Oct. 8. The genuineness of the Epistle of Jude, one of the canonical books of the New Testament, was disputed as early as the time of Jerome, chiefly because it cites the two apocryphal books of "Enoch" and the "Assumption of Moses." Most critics have, however, maintained it. It is written with vehemence and fervor, seems to have been addressed to converted Jews in Asia Minor and beyond the Euphrates, and contends against Gnostic, Nicolaitan, and other dangerous doctrines.—See the "Last of the Epistles; a Commentary upon the Epistle of St. Jude," by Frederic Gardiner (Boston, 1856).

**JUDGES OF ISRAEL.** See **HEBREWS**.

**JUDGES**, Book of, one of the historical books of the Old Testament, narrating the deeds of the 13 judges of Israel from Othniel to Samson. It is a fragmentary rather than a complete and connected history, the fullest accounts being given of Deborah and Barak, Gideon, Jephthah, and Samson. It begins with showing that the calamities suffered by the Hebrews after the death of Joshua were due to their apostasy from Jehovah. It is supposed by many modern critics that the first 16 and the remaining 6 chapters are by different authors. The first portion, believed to have been written before the time of David, is ascribed to Samuel. Among the more important commentators on the book are Le Clerc, Rosenmüller, Maurer, Stader, and the American biblical scholar George Bush.

**JUDGMENT**, in law, a solemn determination of a question, declared by a court of record. The language used in a judgment is, that "it is considered by the court," &c., the theory being that the function of the court is not to give its own decision, but to ascertain and pronounce the decision of the law. To give validity and full force to a judgment, the court which renders it must have competent jurisdiction over the case, or be authorized by law to entertain and determine the question which it decides; the case must have been properly brought before the court; and the trial must have proceeded with due regard to all those forms and acts which are established by law, to prevent surprise, neglect, or error. A judgment may be arrested and avoided, if, within the time prescribed by the rules of the court, it can be shown that there are intrinsic defects appearing

of record, which are of sufficient importance. For, the judgment being founded upon the record, it cannot stand if the party against whom it is rendered can show that the record is inconsistent with it or insufficient for it. The more common instances of this are where there is an irreconcilable contrariety between parts of the record; as, for example, where the judgment is founded upon a verdict which is essentially different from the pleadings at issue.—Judgments are of many kinds, for the reason that they must conform to the pleadings and issue. They are usually classed as judgments upon demurrer, on a verdict, on confession, on default, or on nonsuit. (See **PLEADING**.) A judgment is also interlocutory or final; and the best definition of an interlocutory judgment is to say that it is any judgment which is not final, or which does not entirely dispose of the whole question. A judgment that is final and valid is the highest assurance known to the law. Such judgments were formerly extensively used in England to operate as conveyances of land; the party to whom the land was to be transferred commencing an action for it against the party who was to transfer it, and this being concluded by a judgment that the land in question belongs to the plaintiff.—From the high and solemn nature of a judgment, the doctrine of merger was applied to it. If one sues another on his promise, or indebtedness of any kind, or for wrong of any kind, and recovers judgment, it is a technical rule of law that the original cause of action merges or is lost in the judgment. There is seldom any practical mischief arising from this, as the judgment itself can be sued as well as the former cause of action; but in modern times, and in the United States, a party would undoubtedly be permitted to resort to his original cause of action, unless the judgment had been not only rendered but satisfied, provided it could be shown that he would suffer injury by loss of his original right. So, too, it was a well established rule of law, that if one brought an action against another for depriving him unlawfully of his property, and recovered a judgment for damages, this judgment vested in the defendant a right or title to the property, although the damages were never paid nor the judgment satisfied in any way. The reasons were, that a judgment vests absolutely in the plaintiff a right to the damages, and the law supposes that what should be done will be done, and therefore that the defendant will satisfy the judgment. The effect of the rule was, and so far as it is in force is, that if A borrows B's watch and refuses to return it, and B sues him and recovers \$100 damages, as soon as the judgment is rendered the watch belongs in full property to A, although he never pays one dollar of the damages. It was impossible that a rule so inequitable as this could be uncontradicted. Able judges have declared that the judgment must be satisfied before it could have this effect. Although the cases are quite irreconcilable, we should say, resting very much on the high

authority of Chancellor Kent (2 Commentaries, 388), that the prevailing rule in the United States would not permit a mere unsatisfied judgment to have this effect.—There is no doubt whatever that a judgment of a court of record may be made the foundation of a suit. If it be the judgment of a competent court in the same state, it proves itself; and no defence can be made which does not distinctly impeach it for fraud, or for essential error; and even then the proper course might be to have the judgment itself vacated. If it be the judgment of a court of another of the United States, it falls within that clause in the federal constitution which provides that “full faith and credit shall be given in each state to the public acts, records, and judicial proceedings in every other state,” and authorizes congress to provide the manner in which they shall be proved. Congress, by an act passed May 26, 1790, made this provision. In a case which arose under it, the supreme court of the United States held that it was the intention of the constitution to do more than make the judgments of state courts *prima facie* evidence in other courts; and any judgment, duly authenticated, if it would be considered record evidence of the highest nature and conclusive at home, must be so considered in every other state.—As to the force and effect of a judgment rendered in a foreign country, we are not aided by legislation, but must depend upon the principles of the common law; and that is undoubtedly the same upon this point in the United States that it is in England. The question, how far a foreign judgment, *proprio vigore*, has force and validity, has indeed been discussed in many cases, in both countries, and with some diversity in the conclusions. On one extreme stand those who would make it a mere *prima facie* evidence, open to rebuttal by any evidence tending to show that it ought not to have been rendered. Where this doctrine is held, it is plain that the whole case may be tried over again in the action on the judgment, with the burden of proof on the party who would set it aside. Against this are those who hold the opposite extreme, that a foreign judgment is as conclusive as a home judgment. The law on this subject both in the United States and in England (8 Sumner, 600; 16 Ad. and Ellis, N. S. 717) may now be considered as resting on a medium ground. First, it is certain that no sovereign state is bound to execute a judgment or decree of any foreign state. Next, a foreign judgment is valid and conclusive, provided: 1, that the court rendering the judgment had full jurisdiction of the case; 2, that the case was properly brought before that court and properly tried; 3, that there is nothing in the unquestionable law of the case which forbids or contradicts the judgment; and 4, that it was not obtained by fraud, deception, or oppression. The civilians of the continent of Europe generally maintain the absolute validity of a foreign judgment. But the courts of France have never yet recognized the validity of a foreign judgment, to the

extent to which this is now admitted in England and the United States; although the recent adjudications of that country indicate a much nearer approach than formerly to what may be called the English view of “the comity of nations” in this respect.—Not only may a judgment be made the foundation of a suit, but a former judgment may be relied upon as a defence against a suit which would raise the same question anew. This ancient and important rule is never denied in its general form; and it rests upon the obvious principle that there must be, at some time and by some means, an end of litigation. Therefore, if a question be once tried by a proper tribunal, and in a proper way, and solemnly decided, it is decided for all time, and cannot again be brought up for consideration. In other words, a judgment rendered is conclusive upon the merits of a question; and this rule is now applied, with the qualifications above stated, to a foreign judgment. When it is applied to a home judgment, another difficult question arises, upon which, it must be admitted, the highest authorities stand in conflict, viz.: If a former judgment be offered as a bar to an action, must it appear by the judgment itself, together with the record of the suit, that the question now to be considered was raised and considered in the former case; or, if neither the judgment nor the record, nor both, indicate that the same question was tried before, can this be shown by evidence? Some courts, in their unwillingness to have the merits of a question litigated more than once, have carried this rule so far, for example, as to lead to the conclusion, that if A. sued B. for a house and land, B. could say in defence that the question of their right and title had been tried once and solemnly decided in his favor; and could make out this defence by a record of a former judgment in which A. sued B. for an assault and battery and judgment was rendered for B., if he could then show that B. admitted in the former action the assault and battery, but justified them on the ground that A. persisted in staying in the house in question against the order of B., who thereupon, by the assault and battery alleged, put him out of the house; and that A. admitted all this, only denying that the house belonged to B. and insisting that it belonged to himself; and the only question at the trial was, to whom did the house belong. Undoubtedly, the disposition to let a question which is once determined so remain, is as strong in the courts of the United States at this time as ever. But the ancient rule would have required that the former trial of the question should be proved by record; and that it should have been tried as a direct issue, and not collaterally and as it were incidentally. This we hold to be the prevailing rule at present; and we regard it as resting on sufficient grounds, in the danger there might be in thus permitting one case to determine another case, on the mere evidence of witnesses unsupported by record.—For the lien on the real estate of the judgment debtor created by the judgment, see LIEN.

JUDITH, daughter of Merari of the tribe of Reuben, widow of Manasseh, celebrated for her deliverance of her native city Bethulia when besieged by the Assyrian general Holofernes. It is uncertain whether she lived before or after the Babylonish captivity. Mourning the death of her husband during the siege of the town, and noted for her beauty, she went forth in rich attire to the camp of the enemy, played a faithless part, attracted Holofernes by her charms, and on the third day, when she was alone with him in his tent, and he was intoxicated, struck off his head with a falchion, and bore it into Bethulia. In the morning the Israelites attacked and discomfited the Assyrians, panic-struck at the loss of their general. She lived to the age of 105 years, and the Jews are said to have instituted an annual festival in honor of the victory. The history is contained in the apocryphal book of the Old Testament which bears her name, which, according to De Wette, could not have been written later than the first Christian century, and was probably written much earlier. Calmet supposes the narrative to be a parable and not a real history, an opinion which is now shared by many critics.

JUDSON, ADONIRAM, an American Baptist missionary, born in Malden, Mass., Aug. 9, 1788, died at sea, April 12, 1860. He was the son of the Rev. Adoniram Judson, a Congregational clergyman, and descended from William Judson, who came to New England in 1634. He was graduated with the first honors at Brown university in 1807, and opening a private school in Plymouth, Mass., immediately afterward, he commenced the preparation of his "Elements of English Grammar," and "Young Ladies' Arithmetic," which were published successively in 1808 and 1809. The sceptical views which he had previously held, and which seem to have been the effect of current French infidelity acting upon his peculiar constitution and habits, yielded to an examination of the evidences of Christianity, and his profession of religious faith was made May 28, 1809, in the third Congregational church, Plymouth, of which his father was then pastor. He had already entered the second class at Andover theological seminary, not as a candidate for the ministry, but as an inquirer after truth, and in 1810 his studies in that institution were regularly concluded. In 1809 he read Dr. Buchanan's celebrated sermon entitled "The Star in the East," which became the occasion of his devoting himself to the missionary enterprise. He found kindred spirits in some of his fellow students at Andover, and a formal application for counsel and encouragement, addressed by Adoniram Judson, jr., Samuel Nott, jr., Samuel J. Mills, and Samuel Newell, to the general Congregational association of Massachusetts, became the incipient step toward the formation of the American board of commissioners for foreign missions. Impatient at the slow progress of the American movement, he embarked for England, under an invitation previously re-

ceived, to consult with the directors of the London missionary society in regard to the practicability of coöperation with that society by the newly formed American board. The vessel in which he embarked was captured by a French privateer, and the young missionary soon found himself in a prison in Bayonne, France. Released on parole, through the influence of an American gentleman, he reëmbarked for England, where he arrived in May, 1811, and was offered for himself and his associates appointments and support from the London society, but the plan of coöperation was declined as unadvisable. Turning homeward, he arrived at New York in August, and in September was present at the meeting of the American board at Worcester. Here his eloquent importunity, united with that of one of his colleagues, triumphed over the continued tendency to delay, and Judson, Newell, and Nott, with Gordon Hall, were appointed by the board its missionaries to the Burman empire. Luther Rice was subsequently added to their number, and the 5 young men were ordained at Salem, Feb. 6, 1812. Mr. Judson's marriage with Miss Ann Hasseltine had occurred the day previous to his ordination, and on the 19th of the same month they, with Samuel and Harriet Newell, embarked from Salem for Calcutta. At this place, and at Madras, they were subjected for a full year to much annoyance by the East India company's regulations. Finally they found refuge in flight to Rangoon, in the Burman empire, the place of their original destination, where they arrived in July, 1813. Meanwhile Mr. and Mrs. Judson had adopted the views of the Baptist denomination, and having been baptized by Dr. Carey, English Baptist missionary at Serampore, had surrendered their connection with the American board. Mr. Rice, arriving at Calcutta by another vessel, had on his voyage pursued similar studies with similar results, and had returned to America to enlist the Baptists of the United States in the support of foreign missions. Traversing the entire country, this eloquent and earnest advocate was successful in awakening a missionary spirit among the American Baptists, and in effecting an organization among them for missionary purposes. The Baptist general convention, called since 1845 the American Baptist missionary union, was formed at Philadelphia in April, 1814, and immediately appointed Mr. and Mrs. Judson its missionaries. Established in Rangoon, the field now left to them by the closing of the English Baptist mission, they applied themselves with great zeal to the acquisition of the language, without grammar or dictionary, or teachers who could speak English. Mrs. Judson earliest attained the power to converse; Mr. Judson's habits of thorough philological inquiry rendered his progress less rapid, but made his mastery of the language equal to that of native scholars. In 3 or 4 years he published a "Summary of the Christian Religion," a catechism, and a translation of the Gospel of Matthew. In

March, 1817, an intelligent Burman, accompanied by his servant, presented himself to Mr. Judson as an inquirer; in April, 1819, the first *sayat* (an edifice which is both a caravansary and a place for public meetings) was opened for Christian worship; and on June 27 in the same year the first native convert was baptized. At the close of the year 1820 the number of baptized converts was 10. Meanwhile the mission had been reinforced by the arrival of additional missionaries, and the impression which it was making had, in 1819, excited the displeasure of the new viceroy. Mr. Judson determined to appeal to the king for toleration, and, with his colleague Mr. Colman, ascended the Irrawaddy to Ava for that purpose. He was admitted to an audience, but the plea was unavailing. Believing that they had made a mistake in appealing to the king, and fearing that this measure would bring upon the converts the vengeance of the government, they had well nigh formed the purpose of removing to a safer place in Aracan, but were deterred by the steadfast courage of the native Christians. In 1821 the continued ill health of Mrs. Judson compelled her to return for a time to the United States, where, after a short stay in England, she arrived in Sept. 1822. While in this country she published her "History of the Burman Mission," and by her presence and her personal appeals contributed largely to increase the missionary zeal of the American churches. In the spring of 1823, with her health but partially restored, she re-embarked for Calcutta, accompanied by Mr. and Mrs. Wade as recruits to the mission, and rejoined her husband at Rangoon in the autumn of the same year. During her absence the number of converts had been nearly doubled, and Mr. (now Dr.) Judson had completed a translation of the New Testament, as well as an epitome of the Old. Their residence had been transferred to Ava by request of the king, who was anxious to command the medical services of Dr. Price, a missionary physician who was colleague with Dr. Judson. The sudden breaking out of war however between the East India company and the Burman government brought upon the missionaries, and other foreign residents at Ava, the severest privations, perils, and sufferings. For nearly two years no tidings came of the fate of the missionaries. Three Englishmen residing at Ava having been arrested by the native authorities and examined, it was found that the accounts of one of them showed considerable sums of money paid to Drs. Judson and Price, and, ignorant of the methods of transmitting funds by bills of exchange, the government saw in this fact proof of their complicity with the English in the war. On June 8, Dr. Judson was arrested at his dwelling by a posse of officers, thrown into the "death prison" with all the other white foreigners, and loaded with chains. Mrs. Judson was kept a prisoner in her own house, under the guard of 10 ruffianly men; but on the third day a message to the governor of the city, expressing a desire to appear before him with a

present, resulted in an order for her release. Further gifts secured the promise of an amelioration of her husband's sufferings, and permission to visit him in prison; and by the same means all the prisoners were delivered from their suffocating confinement, and placed in an open shed within the prison enclosure. Hither she sent food and mats for them all, commencing those angelic ministries to the sufferers which have rendered her name immortal. Next, her anticipations were raised by the prospect of a successful petition to the queen; then came the confiscation of Dr. Judson's effects, the most exact lists of them being made by officers in attendance. Careful for the future, she secreted a considerable sum of money, alike indispensable to her support, and to any successful intervention in behalf of her husband, and saved likewise numerous articles which, during the long imprisonment, proved of inestimable value. Then followed the disappointment of all her hopes by the refusal of the queen to interfere. Again she was refused admittance to her husband, and the sufferings of the prisoners were increased; and again relief to them was purchased by her judicious use of presents. Seven months thus passed away, during which she employed her time in devising and executing measures for the comfort of the prisoners, and especially for the release of her husband, scarcely a day passing in which she did not visit some member of the government, or some branch of the royal family; with no other effect, however, than that she and the objects of her solicitude were kept from despair by the encouraging promises of a capricious court. New miseries were still in store. The hot season had arrived, and the sufferings of the prisoners had become intolerable. The birth of a child suspended for a brief period these ministries of Mrs. Judson. Twenty days after this event she was again at the prison, and again in the presence of the governor pleading for ameliorations. Returning to the prison from an interview which the governor had requested, she found the white prisoners all removed. She ran in every direction, making inquiries in vain, until at length she learned from an old woman that they had gone toward Amarapoora, the old capital, distant 6 miles. "You can do nothing for your husband," said the governor; "take care of yourself." She obtained a passport, and set off, first in a boat, and then in a cart, for Amarapoora. Arriving there, she learned that the prisoners had just left for Oung-pon-la. Here she found them, chained two and two, and almost dead from fatigue and suffering. Here they spent the next 6 months, subjected to continual oppression and extortion. The king was at length forced to ask conditions of peace of the British, and in Feb. 1826, Mr. and Mrs. Judson were permitted to rest under the protection of the British flag, in the camp of Gen. Sir Archibald Campbell, who had demanded their release. Descending the river to the territories ceded by the Burman government to the English, they commenced missionary operations at Amherst,

a new town designed to be the British capital. Scarcely, however, were they fixed in this abode, when urgent overtures were made to Dr. Judson to accompany an embassy to Ava, to negotiate a new treaty. In the hope that an article providing for religious toleration might be incorporated, he yielded to the wishes of the commissioner, and parted with Mrs. Judson on July 5, never to see her more on earth. Her constitution, broken by the intense sufferings and cares of the long imprisonment, yielded to an attack of fever, and she died after 18 days' illness. Returning to Amherst, Dr. Judson applied himself with diligence to missionary labors. The number of native converts was increased, many new missionaries arrived, and new branches of the mission were established, that among the Karens starting at once into importance as among the most successful of modern times. Dr. Judson was chiefly employed in the translation and revision of the Sacred Scriptures, and in the preparation of a Burman-English dictionary. His philological tastes and habits qualified him peculiarly for labors of this character. His knowledge of the Burman language and literature equalled that of the most learned men of the empire; and he used the language with elegance and facility. In Jan. 1834, he completed the translation of the Bible. In April of the same year he married Mrs. Sarah H. Boardman, widow of a missionary, the Rev. George Dana Boardman. For 11 years he continued his missionary labors, to a large degree biblical and philological, till 1845, when the failing health of his wife compelled a voyage to the United States. Mrs. Judson died in the harbor of St. Helena, Sept. 1, and was buried on that island. Dr. Judson arrived at Boston, Oct. 15. The emotion excited by his return spread over the whole country, and was shared by every denomination of Christians. He was received with distinguished marks of respect and veneration by public meetings in many chief cities and towns of the United States, and especially by his Baptist brethren assembled in their missionary conventions at New York and Richmond. On July 11, 1846, he reëmbarked for Burmah, having married Miss Emily Chubbuck, a lady well known among American female writers under the name of "Fanny Forester." Arriving at Maulmain in December, he resumed his work with ardor. Under the better auspices occasioned by a political revolution, he established himself for a while at Rangoon, and even projected new attempts at Ava, which a want of means compelled him to abandon. Returning to Maulmain, he assumed the pastorate of the Burman church, and carried forward the dictionary on which he had been so long engaged. In the autumn of 1849 a severe cold, followed by a fever, withdrew him from his work. His disease refused to yield to remedies, and on April 8, 1850, despairing of recovery at Maulmain, he left his wife in a state of health which forbade her accompanying him, and departed with a single attendant for the isle of Bourbon.

He suffered much while descending the river, but rallied for a time on the open sea. On April 12 he sank quietly to rest, and was buried in the ocean.—Dr. Judson was of medium stature, of light and agile form, his features clearly defined and expressive of character, his eyes dark and piercing, his bearing self-possessed but unassuming, and his whole appearance indicative of an uncommon personage. His mental endowments were of a high order, and his early habits of accurate scholarship were maintained amid the disadvantages of missionary labor. That distance and imperiousness of manner which had marked his youth, softened by his piety, became a dignified Christian reserve. Beneath it was a heart full of all gentle affections. His religious consecration was radical and unreserved. He was thoroughly a Christian man. He became a missionary with no romantic hopes. He expected no more than to aid in laying the foundation of the Christian church in Burmah; if he could see 100 converts from Gaudama brought into the Christian fold, and the Bible translated into the Burman language, this would be his adequate reward. He lived to see the Burman mission, including its Karen branches, embracing many thousands of converts, with Bibles, schools, and the ripening elements of a Christian civilization.—A memoir of his life was written by the Rev. Francis Wayland, D.D. (2 vols. 12mo., Boston, 1853). See also a memoir by J. Clement (12mo., Auburn, N. Y., 1852); "Records of his Life, Character, and Achievements," by the Rev. D. T. Middleditch (12mo., New York, 1854); and "The Earnest Man: a Sketch of the Character and Labors of the Rev. Adoniram Judson," by Mrs. H. C. Conant (8vo., Boston, 1856).

JUDSON, ANN HASSELTINE, 1st wife of the preceding, daughter of John and Rebecca Hasseltine, born in Bradford, Mass., Dec. 22, 1789, died in Amherst, Burmah, Oct. 24, 1826. She early developed very remarkable qualities both of intellect and character. Her mind was strong, active, and clear; her spirits buoyant, her attachments ardent, and her fertility of resources for the accomplishment of her purposes unfailing. She was educated at the academy of her native town. Her mind was well disciplined, and her acquisitions were unusually large. Mr. Judson's acquaintance with her commenced in 1810, and resulted soon after in an offer of marriage on his part, and an invitation to share with him the responsibilities and perils of missionary life. They were married at Bradford, Feb. 5, 1812, and on Feb. 19 embarked for Calcutta. Her subsequent history will be found in connection with that of her husband. Her devout and earnest piety, her labors as a missionary, and her heroism and achievements as an angel of mercy to prisoners during the Burman war, have crowned her name with the highest honors. A memoir of her life was written by the Rev. James D. Knowles (2d ed., Boston, 1829; many times reprinted).—SARAH HALL (BOARDMAN), 2d wife of the

Rev. Adoniram Judson, born in Alstead, N. H., Nov. 4, 1803, died at the island of St. Helena, Sept. 1, 1845. She was the eldest child of Ralph and Abiah Hall. While she was a child her parents removed, first to Danvers, Mass., and then to Salem. In her 17th year she was baptized by the Rev. Dr. Bolles, of the 1st Baptist church, Salem. On July 4, 1825, she became the wife of the Rev. George Dana Boardman, and on July 16 they embarked for Calcutta, arriving there Dec. 15. The Burman war still raging, Mr. Boardman accepted temporarily an invitation to preach at the Circular Road Baptist church in that city. Here they remained till the spring of 1827, when they embarked for Burmah, where arrangements were made for the establishment by Mr. Boardman of the mission station at Maulmain, which subsequently became the chief seat of Baptist missions in that country. Here Mrs. Boardman made rapid progress in the acquisition of the language, and availed herself of every opportunity and method in her benevolent work. This mission being fairly established, Mr. and Mrs. Boardman were transferred to Tavoy for a similar service, where was commenced that remarkable work of the propagation of the gospel among the Karens, the inhabitants of the interior jungles. Missionary service among them was performed in part by receiving them into schools at Tavoy, and in part by visiting their villages in the wilderness. In two years Mr. Boardman died. His widow continued her missionary labors, and beside managing a school with great success, and giving religious instruction in various ways at Tavoy, she was accustomed to make long and toilsome journeys among the mountains. In these excursions, assemblies of hundreds gathered around her, and notwithstanding her reluctance to assume what seemed like the office of a public teacher, she was obliged to conduct their worship, and instruct them more perfectly in the Christian faith. In April, 1834, she became the wife of Dr. Judson. Her subsequent life was less eventful, but it was filled with steady, quiet usefulness. She was perfectly familiar with the Burman language, and skilful in the use of it. She translated into it the first part of Bunyan's "Pilgrim's Progress," and various tracts, prepared a hymn book, several volumes of Scripture questions for Sunday schools, and, as one of the last works of her life, a series of Sunday cards. Before the Peguans had a missionary, she acquired their language, and translated or superintended the translation of the New Testament and the principal Burman tracts into the Peguan tongue. In these useful labors she continued until 1845, when her shattered health compelled her to attempt a voyage to America in the hope of its restoration. Embarking with her husband, they were cheered for a time with prospects of her improvement, but a change supervening, she gradually declined, and died in the harbor of St. Helena. A memoir of her life was written by Mrs. Emily C. Judson (18mo., New York, 1850).—EMILY CHUBBUCK, 8d wife of the

Rev. Adoniram Judson, born in Eaton, Madison co., N. Y., Aug. 22, 1817, died June 1, 1854. Though her opportunities of early culture were extremely limited, she made much progress in learning. At the age of 14 she took charge of a district school, and continued teaching, with very brief intervals, until the age of 28, contributing in the mean time a number of pieces in prose and poetry to the village newspapers. In 1840 she entered the Utica female seminary as a pupil, but was soon transferred to the office of teacher. She began her career of formal authorship by writing several Sabbath school books ("Charles Linn," "Allen Lucas," &c.), which, however, yielded little pecuniary remuneration. Charged with the support of her aged parents, she turned to other sources, and in 1844 addressed a playful letter, under the assumed name of Fanny Forester, to Messrs. Morris and Willis, editors of the New York "Evening Mirror," delicately proposing contributions to their journal. Mr. Willis encouraged her, and she soon became a regular contributor to the "Columbian" and "Graham's" magazines. A brilliant literary career was opening before her, when a new direction was given to her destiny by her marriage with the Rev. Dr. Judson, in June, 1846, and their departure for India in July following. Mrs. Judson continued in Burmah until Jan. 1851, when, upon the death of her husband, she returned to America. While in Rangoon she wrote the memoir of Mrs. Sarah B. Judson, and in Maulmain composed some of her best poems connected with her personal history. She returned with a broken constitution, but devoted herself to the care of her children and of her aged parents, and to her literary labors. She prepared and arranged the papers for Dr. Wayland's life of Dr. Judson, and collected her poems, which were published under the title of the "Olio." Her other works are: "The Kathan Slave," a collection of missionary writings in prose and verse, and "My Two Sisters." Her magazine tales and sketches had been collected and published before she left America, under the title of "Alderbrook."

JUGGERNAUT, or JUGGERNAUTH, a town and temple in British India, in the district of Outtaok and presidency of Bengal. The town lies on the N. W. shore of the bay of Bengal, on the coast of Orissa. The ground on which it stands is esteemed holy, and is held free of rent on condition of performing certain services in and about the temple. The principal street is composed chiefly of religious establishments called *maths*, which consist of stone buildings with low-pillared verandas in front and shaded by trees. At the end of this street, which is very wide, rises the celebrated temple. In the vicinity of the town are luxuriant groves and gardens, and many fine tanks of great antiquity. Between the S. W. side of the town and the sea are numerous ancient edifices nearly buried in the drifting sand. The town is 250 m. S. W. from Calcutta, and contains a population of 30,000.—The temple of Juggernaut stands

within a square enclosure, surrounded by a lofty stone wall, each side of which measures 650 feet, making an area of about 10 acres. On the E. side is a grand gateway from which a broad flight of steps leads to a terrace 20 feet high, enclosed by a second wall, each side of which measures 445 feet. From this terrace the great pagoda rises, from a base of 80 feet square, to the height of 200 feet above the ground. It tapers from bottom to top, and is rounded off in the upper part. Most of the Hindoo deities have temples within the enclosure. The great temple is dedicated to Krishna, considered as an avatar or incarnation of Vishnu, and derives its name from his title Juggernaut (properly Jagatnatha, "the lord of the world"). Siva and Subhadra are the next principal objects of adoration, and these three deities are respectively represented by three frightful-looking idols made of blocks of wood about 6 feet high, each surmounted by a grim representation of the human countenance. The block representing Krishna is painted dark blue, while Siva's image is white, and Subhadra's yellow. Each idol is provided with a chariot, which is a lofty platform mounted on wheels. That of Juggernaut or Krishna is the largest, 43½ feet high, 34½ feet square, and is mounted on 16 wheels, each 6½ feet in diameter. The *Rath Jatra*, or great festival of Juggernaut, occurs in March when the moon is of a certain age, and the idols are then taken on their chariots to visit their country house, about 1½ m. from the temple. The chariots are drawn by long ropes held by enthusiastic thousands of men, women, and children, while priests standing on the platforms sing and repeat obscene stories, accompanied by corresponding gestures, amid the applause of the multitude. In former years some of the votaries were occasionally sacrificed by falling accidentally or by design before the chariot wheels, and being crushed to death by the ponderous rolling vehicle; but latterly there have been no occurrences of this sort. The temple of Juggernaut is of considerable antiquity. The present building is supposed to have been completed in 1198 at a cost of more than \$2,000,000. The British obtained possession of the place in 1803. Its former masters, the Mahrattas, had levied a tax upon the pilgrims resorting thither, and out of the large sum thus raised granted a small allowance to defray the expenses of the temple. The British continued this tax and the provision for the maintenance of the temple until 1839, when the tax was abolished and an annual donation from the public treasury given to the priests. In consequence of the scandal created by the spectacle of a Christian government contributing to support the most obscene rites of heathen worship, this donation has recently been withheld, and the temple now depends on a pilgrim tax collected by the native authorities.

JUGGLER, one who practises or exhibits tricks by sleight of hand, or who makes sport by tricks of extraordinary and deceptive dexterity

The further we go back in history the more do we find the juggler assuming the character of the thaumaturgist or worker of serious marvels; and in the 16th century men were burned alive in Spain and Italy for performances which now excite but little wonder. But in the earliest times, when knowledge and science were devoted to strengthening heathen religion, juggling was a real power, and formed the most efficient means of sustaining the dignity of the priesthood. The talent of so wise a body of men as the hierarchy of India and Egypt carried thaumaturgy to an incredible extent, and it is by no means impossible that a great proportion of the marvels ascribed by legend to magicians were actually or apparently performed. The investigations of Salverte have shown in what manner most of these could have been done, and with what effect, especially in the depths of temples, before witnesses filled with awe and devoid of doubt. Thus Iamblichus (*De Mysteriorum*, cap. 29) and Porphyry speak of those who showed the apparitions of gods in the air; a trick explained by Robertson ("Memoirs," vol. i. p. 354) to be of easy performance. The wonder-worker Maximus probably used a similar secret when, on burning incense before a statue of Hecate, the goddess was seen to laugh so plainly as to fill all present with horror. Ordinary jugglers at the present day show the face of another person to those looking in a mirror, a trick also used by fortune tellers to exhibit future husbands to superstitious girls. This, which is done by a very simple optical contrivance sold in many shops, perfectly explains the manner in which the Agrippas and Faustus of the middle ages, as well as the earlier magicians, showed those who were supposed to be absent, or the forms of the departed, as Cleonice appeared to Pausanias. Juggling, properly regarded, is a science, the principal of whose divisions is that of sleight of hand or substitution. The commonest tricks performed by these means have been known to all cultivated races. The tosser of knives and balls, the marvellous balancer, the producer of unexpected objects from strange receptacles, occur in Saxon MSS. and on the walls of Egyptian and Etruscan tombs; they amazed the Norseman and the Roman; and when the troubadour degenerated to a vagabond, he became a *jongleur* (Lat. *joculator*), whence the word juggler. The tying and untying of intricate knots, which has even in these days been attributed to supernatural agency, yet which is shown by every juggler, leads us back to the Scottish warlock whom no bonds could hold, and to the symbolic mazes of Runic and Gordian ties. Within a few years London was amazed at a man who could tell one person in secret what card it was that another thought of. Lord Bacon (*Sylva Sylvarum*, cent. ix. 946) tells of one that "did first whisper the Man in the Eare, that such a Man should think such a Card." Those who have seen glasses or chains broken, and handkerchiefs apparently torn to pieces, and then restored to the owners,

may be amused to know that a learned writer of the 16th century, Fromann (*Tractatus de Fascinatione*, p. 583), really believed that this was done by magic, though he tells us in the same book that in his time many common jugglers (*canculatores aut saccularii*) were often mistaken for magicians. Modern wizards simply amuse by showing us eggs or other objects which dance and follow the motion of the hand, an invisible silk thread or hair being the medium used; but of old the king of Babylon stood at the parting of the ways and used divination with arrows which leaped up and pointed the way he was to go, as they did in after times for the Arabs (Koran, v. 99); and for the Tartar Genghis Khan the same trick was used. Reginald Scot, in his "Discoverie of Witchcraft," explains how the head of a man may come through a table, upon a plate, and being duly whitened like a corpse may astonish the world by talking—an account which throws much light on the talking heads of Arabic, Greek, Hebrew, Norse, and mediæval fable. Fifty years ago ventriloquism was regarded as a physiological mystery, and of old it seemed awful when the river Nessus saluted Pythagoras, when a tree spoke before Apollonius, and when a new-born infant, or animals, or statues talked. Every modern juggler allows himself to be shot at; the first European, Laing, who went among the Soulimas, near the source of the Joliba, saw a native chief perform the same trick on a grand scale and in a curious manner, the muskets always flashing in the pan when aimed at him, but shooting well when turned, however unexpectedly, to other objects. In all ages, and especially in the East, wizards have stuck arrows and swords through their own limbs, and driven nails through their hands; but when in 1859 a so-called "India rubber man" attempted to astonish by similar feats, his secret was quickly exposed in the newspapers. Ancient jugglers performed extraordinary feats by mechanism, which is defined by Cassiodorus (*Variarum*, lib. i. c. 45) as "the science of constructing machines whose effects shall seem to reverse the order of nature." In those days the floors of temples heaved like waves, doors widened of themselves to admit portly visitors, tripods advanced to salute them, statues wept, nodded, and bled; all which marvels are imitated by modern jugglers. In the 17th century, by acoustics, invisible sprites called *tramarres* rapped audibly on any object indicated; in the 19th Haller and Blitz summon them again. The abbé Mical and Maelzel in modern times astonished the world with *androides*, little speaking figures; the Egyptian priests made gods and statues which prophesied and explained dreams. Stone statues of the gods which rang like a bell when struck (Pausanias, "Attica," cap. 42) are still found in China as the jade stone images of Buddha. In optics, the Chinese jugglers show a clear metallic mirror which, when it reflects sunshine on a wall, exhibits in the circle of light an inscription; a secret accidentally discovered a

few years ago in Paris by seeing a letter stamped in the back of a daguerreotype plate reflected in like manner, though not visible on the reflecting surface. The magic lantern fully explains the images of the gods shown in the water by ancient wizards, and the devils seen by Benvenuto Cellini in the Colosseum. In hydrostatics, the bottle yielding all kinds of wine, which has often appeared in romance, as on the table of Faust, has been realized by many wizards of the present day. Many tricks of modern eastern jugglers have however never been fairly explained. Their placing a boy in a basket on the ground and stabbing through it, causing blood to flow and the boy to vanish and reappear, is one of these; so too is their curious trick of making trees grow visibly in a few minutes. Something like this was shown by a Neapolitan, who professed to make lettuce seed sprout by electricity, and who thereby long puzzled the scientific world. In modern Egypt (Lane, "Manners and Customs of the Modern Egyptians," vol. ii., c. vii.) a naked juggler is tied up in an empty bag, and comes out bringing with him plates of food and lighted candles. The Indian jugglers are also exceedingly skilful.—Common jugglers are said to have originated in Egypt, and made their appearance in Greece; in Rome they were termed *prestigiatores, pilarii* (ball players), and *saccularii*, "those who tricked with bags and into pockets." The real Faust of the middle ages was a common juggler, and much below the dignity of black-art scholars like Agrippa and Paracelsus. Of his class was the Bohemian Zito. The most remarkable jugglers of modern times have been Pinetti, Eckhartshausen, Philadelphia, and the famed Katterfelto. More recently we have had Bartolommeo, Bosco of Turin, Döbler, Prof. Anderson, Heller, Houdin, Hermann, and in America Blitz. Most eminent of these is the Frenchman Robert Houdin, who applied to his art not only true genius but the resources of science. His memoirs were published in Paris in 1859. For other works on the subject, see Reginald Scot, "Discoverie of Witchcraft" (1584); Wiegleb, *Natürliche Chemie* (26 vols., Berlin, 1779–1805); J. S. Halle, *Magie* (17 vols., Berlin, 1783); Funk's *Natürliche Magie* (Berlin, 1816); K. O. Eckhartshausen, *Ueber die Zauberkräfte der Natur* (Munich, 1819); Sir David Brewster, "Lectures on Natural Magic" (London, 1832–5); Eusèbe Salverte, *Des sciences occultes* (Paris, 1843).

JUGURTHA, a Numidian king, born in the 1st half of the 2d century B. C., died in Rome in 104 B. C. He was the illegitimate son of Mastanabal, youngest son of Masinissa, king of Numidia. Micipsa, his paternal uncle, on succeeding to the throne, adopted him, and had him brought up with his own sons, Hiempsal and Adherbal. Jugurtha soon distinguished himself so much by his superior abilities, and skill in all martial exercises, as to excite the jealousy of Micipsa, who, to remove him out of the way, sent him in B. C. 134 with an auxiliary force to aid Scipio in the Numantine war. Jugurtha's courage and

capacity won him the friendship of the Roman commander and officers, many of whom are said to have secretly stimulated him to aspire to the sole sovereignty of Numidia on the demise of his uncle. On the conclusion of the war he returned to Numidia, and was received with ceremonious respect by Micipsa, who, to purchase his forbearance, made him at his death heir to the kingdom in common with his two sons. But the three princes quarrelled on their first meeting after his death, and a little later Hiempsal was assassinated by Jugurtha. Adherbal and his party took up arms, but were defeated, when he fled for refuge to Rome, and submitted his case to the senate, who, despite the intrigues and bribes of Jugurtha, sent commissioners to Africa to divide Numidia between the rivals. The commissioners took gifts from Jugurtha, and gave him the larger and better half of the kingdom. He was not however satisfied. After trying in vain to provoke Adherbal to declare war, he threw off the mask, invaded that prince's territory, and compelled him to take refuge in Cirta, where, on the surrender of that city in 112 B. C., himself and all his followers were massacred. The conduct of Jugurtha now excited loud indignation at Rome, and an army was despatched to Africa to depose him. But the Roman commander and legate suffered Jugurtha to purchase peace on terms which involved no greater sacrifice, on his part, than 80 elephants and an inconsiderable sum of money. This shameful transaction so weakened the confidence of the Roman people in the patricians, that the prætor Cassius was sent to Numidia to guaranty to Jugurtha a safe-conduct if he would go to Rome and give evidence against the generals. The king consented, proceeded to the imperial city, and appeared in the *comitia*; but a tribune in the interest of the generals forbade him to testify, and the attempt to convict the corrupt officers proved a failure. Jugurtha remained at Rome for some time, intriguing and adding to his influence among the aristocracy. Having however procured the assassination of Massiva, a Numidian prince, who since the death of Adherbal had been a competitor for that kingdom, he was ordered to quit Italy. It was while leaving Rome, on this occasion, that he uttered the memorable exclamation, which indicates how the Romans had fallen from their ancient integrity: "Behold a city for sale, could she but find a purchaser." The war was now renewed against Jugurtha, and Spurius Albinus was appointed to conduct it, during whose command a division of the army was surprised by Jugurtha in its camp, the greater part cut to pieces, and the survivors compelled to pass under the yoke. This disgrace stirred up the Roman spirit, a new army was raised, and Q. Cæcilius Metellus was sent to succeed Albinus. Metellus was at once an able general and an honest man. After the first campaign Jugurtha was willing to purchase peace on any conditions short of surrendering himself a prisoner of war. Metellus, however, was ambitious not only of

terminating the war, but of adorning his triumph with the vanquished, and the contest was renewed. Nothing memorable was achieved during the remainder of Metellus's term. The Numidian, avoiding a general engagement, resorted to guerilla tactics; while the Roman, on hearing that the plebeian Marius was to supersede him in the command, discontinued offensive operations, determined that no act of his should tend to lessen the difficulties which lay in the way of his successor. Marius arrived in Africa in 107 B. C., speedily reduced almost all the strongholds that had been in the possession of the king at the time of his arrival, and gradually subjected his territory to the dominion of Rome. Jugurtha, seeing his kingdom slipping from his grasp, made one final effort to retrieve his fortunes. Having formed an alliance with Bocchus, king of Mauritania, the two monarchs with their united forces attacked the army of Marius on its march, but after a desperate contest they were totally defeated. The Mauritanian king now deserted his ally, and enticed him into an ambuscade, where he was made prisoner, and delivered in chains to Sylla, the quæstor of Marius. He was afterward taken to Rome, and, after adorning the triumph of his conqueror (Jan. 1, 104), was cast into prison, where he died of starvation at the end of 6 days. The details of the life of Jugurtha are chiefly known from the interesting history of the "Jugurthine War" by Sallust.

JULIAN (FLAVIUS CLAUDIUS JULIANUS), surnamed the Apostate, a Roman emperor (A. D. 361-363), born in Constantinople, Nov. 17, 331, died in Persia, June 26, 363. He was the son of Julius Constantius, the grandson of Constantius Chlorus, and the nephew of Constantine the Great. When the tyrant Constantius II. ordered the male descendants of Chlorus by his second wife Theodora to be put to death, he made an exception in favor of Julian and his half brother Gallus, whose tender years did not excite his apprehension. But, though he spared their lives, he banished them to certain cities of Ionia and Bithynia, and ultimately confined them in the strong castle of Macellum near the Cappadocian Cæsarea. During the period of their restraint Julian was not only instructed in the doctrines of the Christian faith, but taught to fast, to pray, and to fill the office of reader in the church of Nicomedia. In 351 Gallus was taken from prison, invested with the dignity of Cæsar, and made prefect of the East. Through his mediation Julian was liberated, and permitted to fix his residence in any of the Asiatic cities. He now first became acquainted with those Platonic philosophers who ere long induced him to abandon Christianity for paganism. He was not however ambitious of persecution, and did not make a public avowal of his apostasy till he could do so with perfect safety. After the murder of Gallus, he again became an object of distrust to Constantius, who had him transported to Italy, and imprisoned at Milan, whence having been liber-

ated by the intercession of the empress Eusebia, he retired to Athens. Constantius soon recalled him, and on Nov. 6, 855, proclaimed him Cæsar, and gave him his sister Helena in marriage. He was at the same time invested with the government of all the transalpine provinces, and with the command of the forces which were to drive the German invaders of Gaul beyond the Rhine. Having with equal skill and energy effected this latter undertaking, and checked the rapacity of the local governors, he acquired such popularity that when the jealous Constantius in 860 commanded him to send his best soldiers to the Persian war, the troops proclaimed him emperor. Julian crossed over into Germany and made an admirable march along the forest-covered valley of the Danube with the intention of advancing against Constantinople; but the sudden death of Constantius in Cilicia gave him undisputed possession of the empire. On Dec. 11, 861, he made his triumphal entry into the capital, amid the acclamations of the soldiers, the citizens, and the senate. He now openly avowed his abandonment of Christianity, which had long before been known to his friends, and his Christian subjects apprehended a cruel and relentless persecution. Shortly after his accession, however, he published an edict which granted perfect toleration to all sects and religions. But the spirit of this edict was not respected even by Julian himself. He excluded Christians from civil and military offices, forbade them to teach grammar and rhetoric in the schools, compelled them to contribute to the building and repair of pagan temples, permitting at the same time the Jews to rebuild their temple at Jerusalem, and wrote a voluminous treatise against the assumed errors of Christianity. Amid the licentious priests and lascivious dancers who thronged the pagan temple, he was frequently seen bearing the wood, kindling the fire, slaughtering the victim, and divining from the entrails of the expiring animal. He was nevertheless worthy in other respects to wield the sceptre. Immediately after his accession he applied himself to reform the luxury and extravagance of the imperial court. He ordered the laws to be equitably administered, and instituted a tribunal for the trial of such officials as had been guilty of peculation or oppression in the former reign. The incursions of the Persians upon Roman territory led him to declare war against that people, and in 863, having crossed the Euphrates at Hierapolis, he advanced with the main body of his army against the royal city of Ctesiphon. Under the walls of this place he gained a brilliant victory over a division of the enemy; but having been induced by the representations of a Persian noble, who affected to be a fugitive, to postpone the siege of Ctesiphon, and to march into the desert in search of Sapor, the Persian monarch, he was surprised by the enemy, and in the battle which ensued received a wound from an arrow which proved mortal in the evening of the same day. Jovian was proclaimed his successor on the

battle field. In his manner of life Julian emulated the temperance and simplicity of the primitive Romans; he was indefatigable in the discharge of his public duties, and in his intervals of leisure was devoted to study and philosophy. He possessed rhetorical and literary talents of a high order, and wrote much and well on various subjects. The ablest if not the most important of his extant works are: the "Cæsars," or the "Banquet," a satirical composition in which the different Roman emperors are made to appear at a celestial banquet where old Silenus censures their vices and crimes; and the "Misopogon," or the "Beard-Hater," in which the emperor exposes the licentiousness and effeminacy of the citizens of Antioch, who had ridiculed the beard of their sovereign, such appendages not being fashionable in that city. His treatise against the Christians has been lost, with the exception of those extracts preserved in the refutation of it by Cyril of Alexandria. The best collective edition of the works of Julian is that of Spanheim (Leipsic, 1696). The most celebrated modern lives of Julian are by Gibbon in his "Decline and Fall of the Roman Empire;" by the abbé de la Bletterie, *Histoire de l'empereur Julien l'apostat* (Paris, 1785); and by Neander, *Ueber den Kaiser Julianus und sein Zeitalter* (Leipsic, 1812).

JÜLICH, a circle of the Prussian province of Aix la Chapelle (pop. 50,000), with a capital of the same name (pop. 4,000), situated on the river Roer, 26 m. from Cologne. The town is the Juliaeum mentioned in the "Itinerary" of Antoninus. One of the imperial counts of Jülich, Girard I., assisted Henry the Fowler in his warfare against the Hungarians, and the county of Jülich was raised to the rank of a duchy in favor of Girard's descendants by the emperor Charles IV. (1356). For a long time afterward Jülich was one of the independent duchies on the Rhine, until the beginning of the 17th century, when the line of hereditary dukes became extinct. At the congress of Vienna in 1814 the duchy was allotted to Prussia, with the exception of a few localities annexed to the Dutch province of Limburg. The razing of the fortress of Jülich was begun in 1860.

JULIEN, STANISLAS AIGNAN, a French orientalist and sinologue, born in Orleans, Sept. 20, 1799. He was the son of a noted mechanician. After completing his classical studies in his native town, he repaired to Paris, and, while making himself acquainted with several living European languages, perfected his knowledge of the ancient Greek by attending the lectures of Gail at the college of France. He was on the point of emigrating to Camden, S. O., where one of his elder brothers was established as a manufacturer of fire-arms, when news of his brother's death arrived and detained him in France. Gail appointed him his substitute in 1821; and to vindicate his claims to this distinction, he published in 1823 a critical edition of the poem of Coluthus, *Ἐλενης Ἀρπάζη*, with translations in Latin, French, Italian, Spanish, English, and

German. In 1824, under the title of *La lyre patriotique de la Grèce*, he produced a French translation of the lyrical poems of the modern Greek poet Kalvos of Zante. A young Scotchman inspired him with a taste for the Chinese language, and introduced him to Sir William Drummond, who supplied him with the means of studying that language. He also attended the lectures of Abel Rémusat, and mastered the Chinese with such uncommon rapidity that within a year he was enabled to translate into Latin the writings of Mencius (Meng-tseu). This work was published at the expense of the Asiatic society of Paris. Since then he has accomplished much toward making Chinese literature known in Europe. Among his numerous translations are two dramas: *Hooi-lan-ki, ou l'histoire du cercle de craie* (8vo., London, 1832); and *Tchao-chi-kou-eul, ou l'orphelin de la Chine* (Paris, 1834); a novel, *Pé-che-ting-ki, Blanche et Bleue, ou les deux couleurs-fées* (Paris, 1834), and several other tales which appeared in the 5th volume of the *Salmigondis*, or in the *Constitutionnel*; two philosophical works of great fame, *Kan-ting-pien, le livre des récompenses et des peines* (London, 1835), and *Lao-tseu Tao-king, le livre de la voie et de la vertu* (Paris, 1841); two interesting treatises, *Résumé des principaux traités Chinois sur la culture des mûriers et l'éducation des vers à soie* (1837), and *Histoire et fabrication de la porcelaine Chinoise* (1856). His most important work appeared under the general title of *Voyages des pèlerins Bouddhistes*, three volumes of which have been already published (1853-'7-'8), containing *Histoire de la vie de Hiouen-tsang et de ses voyages dans l'Inde*, and *Mémoires sur les contrées occidentales*. This work throws much light on the early history and geography of India; a portion of the publishing expenses was defrayed by the English East India company. He has beside in MS. or in preparation several other works, among which is a complete Chinese dictionary. In 1832 M. Julien succeeded Abel Rémusat as professor of the Chinese language and literature; he was elected in 1833 to the academy of inscriptions, intrusted in 1845 with the keeping of the Chinese department in the royal (now imperial) library, and promoted in 1855 to the rank of administrator of the college of France; he is an associate of nearly all the learned societies of Europe, corresponds with several mandarins, and is said to enjoy a high reputation in the literary world of China.

**JULIUS**, the name of 8 popes. I. **SAINT**, born in Rome, died there, April 12, 852. He was chosen pope, Feb. 6, 837. He sustained Athanasius in his contest with the Arians and summoned a council in 842 to take action in the matter. Another council was held at Sardica in 844, at which it is asserted that the right of arbitration in cases of deposition of bishops was reserved to the see of Rome. Two letters of Julius are given in the *Epistola Romanorum Pontificum*. II. **GIULIO DELLA ROVERE**, born in Albisola in 1441, died Feb. 21, 1518. He was

bishop successively of Carpentras, Albano, Ostia, Bologna, Avignon, and Mende, and was made cardinal by his uncle Sixtus IV., who also gave him command of the papal troops sent against the revolted Umbrians. His success in this war so increased his popularity, that Alexander VI. on assuming the tiara banished him from Rome. Julius returned to the camp, and contributed an important part in the conquest of Naples by Charles VIII., the rising of the Genoese, and the expulsion of Luigi Sforza. On the death of Alexander, Aug. 18, 1503, he caused the election of the aged Pius III., who survived his elevation only 26 days, and Julius himself was then chosen on the first ballot. His first care on coming to the throne was to drive out Caesar Borgia from the Papal States, his next to strengthen and extend the power of the holy see. The refractory nobility at home were soon reduced to obedience, but the Venetians, who held Ravenna, Rimini, and other territories of the church, were a more formidable enemy. After fruitless negotiations, Julius joined in 1509 the famous league of Cambrai, formed by the emperor Maximilian, Louis XII. of France, and Ferdinand of Aragon, for the dismemberment of the Venetian republic. The troops of the league were everywhere successful; the doge sued for peace, and the pope, who had now got what he wanted, grew jealous of Louis, and willingly united with the Venetians to expel the French from Italy. Ferdinand was also led to view the success of Louis with uneasiness, and became a party to the "holy league," which was signed Oct. 4, 1511, and whereof Henry VIII. of England afterward became a member. Julius took the field in person, and, after several campaigns of varying success, drove out the "barbarians," as he termed his former allies. He could not so easily rid himself of the Swiss, German, and Spanish troops by whom he had effected this result, and in the midst of the disorder raised by his warlike and ambitious policy, he died without achieving for the holy see that preëminence which had been the whole aim of his pontificate. Julius was in heart and action a thorough soldier. He "made his tiara a helmet and his crosier a sword," and his disposition is well expressed in an old epigram:

Cum Petri nihil efficiant ad prelia claves,  
Auxilio Pauli forsitan ensis erit.

He was nevertheless regarded by the Italians as a friend to the liberation of their country, and the justice and wisdom of his internal administration gained him their affection. He laid the corner stone of St. Peter's church, and was a patron of Michel Angelo, Bramante, and Raphael. It was Julius II. who granted Henry VIII. a dispensation to marry Catharine of Aragon. He was succeeded by Leo X. III. **GIAN MARIA DEL MONTE**, born in Arezzo, Sept. 10, 1487, died March 28, 1555. He belonged to a noble family, held several high offices under the papal government, was made cardinal in 1536, and succeeded Paul III. in 1550. He reopened the sittings of the council of Trent,

which had been discontinued under his predecessor, and confirmed the institution of the Jesuits. He took part with Charles V. in his quarrel with Ottavio Farnese and the French, but was compelled to sign a truce with his enemies in April, 1552, soon after which he declared the suspension of the council of Trent, which had already been broken up by the Protestants, and retired to his luxurious villa near Rome. He reconciled England with the holy see under the reign of Queen Mary. He was succeeded by Marcellus II.

JULIUS, NIKOLAUS HEINRICH, a German physician, born in Altona, Oct. 3, 1788. With a view of examining the condition and management of prisons, he explored many parts of Europe and the United States, delivered lectures, and published a variety of works on this and kindred subjects, as *Die Amerikanischen Verbesserungssysteme* (Leipsic, 1837); *Nordamerika sittliche Zustände* (1839); *Beiträge zur britischen Irrenheilkunde* (1844), &c. He has also edited the *Jahrbuch der Straf- und Besserungs-Anstalten* (Berlin, 1829-'48), and in concert with Gerson the *Magazin der ausländischen Literatur der gesammten Heilkunde* (Hamburg, 1821-'35). In 1849 he returned to Hamburg, where he had previously practised his profession. His German translation of Ticknor's "History of Spanish Literature" appeared in 1852.

JULLIEN, LOUIS GEORGE, a French composer and director of music, born in Sisteron, Basses-Alpes, April 23, 1812, died in Paris, April 16, 1860. From his father, who had been band master of the Swiss guards in the service of Louis XVI., he inherited a talent for music, and at 6 years of age was a skilful performer on the violin. Subsequently he served in the French army and navy, and about 1830 gained admittance as a pupil into the *conservatoire* at Paris, where he was instructed by Cherubini. Upon leaving this institution he became director of the concerts in the Champs Elysées. In 1839 he went to England, and for a number of years directed promenade concerts in London with great success. In 1847 he attempted to establish the English opera in a style of splendor equalling that bestowed upon the Italian; but upon the failure of the enterprise, he resumed his concerts, which were among the most popular ever given in England. In 1853 he produced at Covent Garden theatre an opera entitled *Pietro il Grande*, which met with considerable success, and in the same year, accompanied by a large orchestra, he visited the United States, in the chief cities of which he gave concerts for several months. His subsequent career was less prosperous, and he died in a charitable institution. He composed and arranged innumerable short pieces, and was the means of rendering popular some of the best compositions of the oldest masters, and of bringing before the public a number of prominent singers and instrumental performers.

JULY, the 7th month in our calendar, having 31 days, named in honor of Julius Cæsar. It was at first called by the Romans Quintilis,

(*quintus*, fifth), being the fifth month in the ancient Roman year, which began with March. The name was changed by proposal of Antony, because Julius Cæsar was born on the 12th of this month. Charlemagne gave it the name of *Heumonat* (mowing month).

JUMNA, a river of Hindostan, and the principal tributary of the Ganges. It rises in the protected hill state of Gurwhal, near the S. base of the Himalaya, in lat. 31° N., long. 78° 30' E. Its source is at the foot of a group of hills called the Jumnotri peaks, near which it receives the overflow of several hot springs. It is here a violent torrent, having for 16 m. an average descent of 814 feet per mile. After a S. W. course of about 60 m., during which it is joined by several large mountain streams, it turns to the W., and in lat. 30° 30', long. 77° 53', receives the Tonse. About 97 m. from its source it enters the plain of Hindostan, flowing S., and divides into several branches. It here becomes navigable by rafts. After passing the city of Delhi, where it throws off a branch, and is crossed by a bridge of boats, its general course is S. E. It joins the Ganges at Allahabad, 619 m. below Delhi, and 860 m. from its source. The two rivers are here about equal in volume, and both are regarded as sacred by the Hindoos. In the lower part of its course the Jumna is sometimes 2 or 3 m. wide. Its banks are rocky and precipitous, and its current is rapid. Navigation is attended with much difficulty, but many of the most serious obstructions have been removed, and vessels can now ascend to Calpee. Its principal affluents are the Chumbul, Baun, Sinde, Betwa, Cane, Hindon, and Seengoor. Delhi, Agra, Allahabad, Minpooree, Etawah, Muttra, and Calpee are the most important places on its banks. A canal has been projected to unite the Jumna about 80 m. above Delhi with the Sutlej at Loodiana. Three irrigating canals are also fed by it. One called the canal of Feroze Shah, built in 1856 and reopened after 85 years' disuse in 1823-'5, separates from the river on the right side near Chooarpoor, and passes by Hansi and Hissai, being 240 m. long. Another, the Delhi canal, branches off from this and rejoins the Jumna at Delhi, after a course of 70 m.; it was built by Ali Murdan Khan, a favorite officer of Shah Jehan from 1638 to 1656, and, after having been choked up for 60 years, was restored by Lord Hastings in 1817-'20. The Doab canal, on the left bank of the river, leaves the Jumna near Fyzabad and rejoins it opposite Delhi; it was repaired in 1824-'30, and is 135 m. long. The waters of the Jumna in its lower course are so strongly impregnated with natron as to be unfit for drinking.

JUNE, the 6th month in our calendar, having 30 days. The name is variously derived from *juniores* (the young men), to whom Romulus is said to have assigned it, as he assigned May to the elders; from Juno, whence it was sometimes called Junonialis; from Junius Brutus, the first consul; and from *jungo* (to join), with reference to the union of the Romans and Sabines. It

was named by Charlemagne *Brachmonat* (fallow month).

JUNG BAHADOOR COOMARANAGEE, prime minister of Nepaul, born about 1816. He is the 2d son of a general who commanded part of the rajah's army on the N. W. frontier. While serving as a subaltern under his father he manifested a daring and adventurous spirit, which, if it frequently led him into breaches of military discipline, gained to an extraordinary degree the affection of the soldiers. He visited the British possessions in upper India, and on his return, instead of being punished for absence from his post without leave, was promoted to the rank of captain. In 1839, his uncle Mahtabar Singh having been made prime minister, he went to court, where he became implicated in a conspiracy against the British, and marched with a secret expedition to Benares; but his plans being discovered, he was made prisoner and carried back to Nepaul. Released on the frontier, he divided his attention for a while between gambling and politics, for both of which he showed a remarkable aptitude. In 1845 the ranee (queen) resolved upon the destruction of Jung's uncle, the prime minister, and chose the nephew as her agent. Mahtabar Singh was treacherously shot by Jung, and the assassin received for reward the chief command of the forces with a place in the new ministry. In the course of the following year, acting in concert with the ranee, who had almost absolute control over her imbecile husband, he became premier by a *coup d'état*, shooting down 14 nobles with his own hand in the audience hall of the palace. He soon lost the favor of the ranee, and, having foiled an attempt upon his life, caused her to be banished. This was followed by the deposition of the king and the elevation of the heir apparent to the throne. Jung, however, retains the whole power of the state, and is the virtual sovereign. His administration has proved advantageous to the country, and has been marked by improvement in its laws and the development of its resources. He is feared and hated by the king and the nobles, but is a favorite with the army and the people. In 1850 he visited England in the quality of ambassador, the ostensible purpose of his mission being to negotiate respecting a disputed tract of territory on the British and Nepaulese frontiers. He landed at Southampton May 25, attended by a splendid retinue and bearing costly presents to Queen Victoria; and after a stay of a few months, during which he was the object of many attentions and intense public curiosity, he returned home, stopping a while in Paris, and arriving at Bombay in November. Soon afterward he caused his daughter to be married to the Nepaulese heir apparent. He cultivated the friendship of the English, affected English modes of life, and when the revolt broke out in 1857 offered his services in suppressing it. He took the field with 9,000 Gorkhas, assisted in the capture of Lucknow, and in the summer of 1858 returned to Catmandoo, having received from Queen Victoria

the grand cross of the order of the bath. He afterward opened a fresh campaign against the remnant of the rebels on the Nepaulese frontier, crushed and dispersed them in Dec. 1859 in a decisive battle, and thus brought the war definitively to a close.

JUNG-STILLING (JOHANN HEINRICH JUNG), a German mystic author, born in Im-Grund, Nassau, Dec. 12, 1740, died in Carlsruhe, April 2, 1817. After being successively a charcoal burner, tailor, and teacher, he began to study medicine at Strasbourg, where he became acquainted with Goethe, who in his autobiography has given a fine analysis of his naive, trustful, and affectionate character. He operated for cataract with eminent success at Elberfeld, was professor of rural economy at Lantern (1778), Marburg (1787), and Heidelberg (1808), and at his death was a privy councillor of Baden. The best known of his writings is an autobiography, *Stilling's Jugend, Jünglingsjahre, Wanderschaft, Lehrjahre, häusliches Leben und Alter* (published in three parts, 1787, 1789, and 1817), a curious work, containing many profound thoughts, and marked by an eccentric religious and moral enthusiasm. He wrote several allegorical and mystical tales, as the *Geschichte des Herrn von Morgenthau* (1779), *Geschichte Florentins von Fahlendorf* (1781), *Leben der Theodora von Linden* (1788), *Das Heimweh* (1794), and *Theobald, oder der Schwärmer* (1797). In his autobiography he took a sentimental delight in picturing his 3 successive wives, and love and marriage are treated with special enthusiasm in his romances. In his later works he appears as a ghost-seer and theosophist. The most important of them are: *Theorie der Geisterkunde* (1808), and *Apologie der Theorie der Geisterkunde* (1809), full of marvellous but not carefully authenticated narratives; *Scenen aus dem Geisterreich* (1817), consisting of conversations in heaven, and inculcating a sort of worship of genius; and the poem *Chrysdon, oder das goldene Zeitalter* (1819), descriptive of the millennium. His various works were collected in 14 vols. (Stuttgart, 1838).—His daughter AMALIE, who presided over an institution founded by the grand duchess Stephanie of Baden, died in Mannheim in Jan. 1860.

JUNGERMANNIA (Linn.), the name of a genus of small cryptogamic plants, of which there are many species indigenous to North America. The genus is dedicated to Jungermann, a German botanist of the 17th century, and it was at one time the type of the natural order, which comprises a large number of distinct kinds. They are also sometimes called scale mosses, being creeping moss-like plants, with entire, or from two to many lobed stem leaves, the fructification terminal on the main stem or on a short branch; the floral organs are scattered, free or immersed antheridia and solitary pistillidia, having both an involucre and involucl. The seed-like bodies (*sporidia*) are mixed with spiral threads (*elaters*), and con-

tained in 4-parted and 4-valved spore cases. These little plants are interesting to the botanist on account of the intermediate rank which they maintain between certain lower and higher orders of the acrogens, and as indicating the approach in gradual development to a higher organization. The number of species found in this country, according to Sullivant's "Mosses of the United States," is 18, all represented by European types. Most of them grow in woods and among mosses upon wet rocks, trunks of trees, and wherever moisture is periodically to be found. Some affect alpine situations, as *J. setiformis* (Ehrlart). Scarcely any other plants exceed the entire group of the *Jungermanniaceae* for delicacy of forms, beauty of foliage, variety of colors, contour of expansive development, elegance of the organs of fructification, and minuteness of proportions, or afford the botanist more pleasure in their investigation.—See Sir Wm. J. Hooker, "British Jungermanniaceae, or a History and Description with Colored Figures of the Genus and Microscopical Analyses of the Parts" (folio, London, 1816); Gray's "Manual of the Botany of the Northern United States" (revised ed., New York, 1858).

JUNGFRAU (the "Maiden" or "Virgin"), a picturesque mountain, or rather group of mountains, in Switzerland, forming one of the ridges of the Bernese Alps, and separating the cantons of Valais and Bern. It is the 8th in height of the European mountains, reaching an altitude of 13,718 feet, and derives its name either from the pure mantle of snow which covers its crest, or from the fact that until the present century it was deemed inaccessible. In 1811, however, the brothers Meyer of Aarau claimed to have ascended it. In 1828 the highest peak was reached by some peasants from Grindelwald, and in 1841 by Prof. Agassiz, accompanied by Prof. Forbes of Edinburgh and others. Although the thermometer fell to 6½° below zero, lichens were found on the highest exposed points. The highest peak rises in a sharp point, the summit being not more than 2 feet broad. The Silberhörner, which are inferior peaks on the W. side, are remarkable for their graceful forms.

JUNGHUHN, FRANZ WILHELM, a German naturalist, born in Mansfeld in 1812. He studied medicine, botany, and geology in Halle and Berlin, and became assistant surgeon in the Prussian army. Having fought a duel, he was sentenced to 20 years' imprisonment, but escaped to France, and afterward entered the foreign legion in Algeria as a medical officer. Ill health compelled him to return to France, and, having received a pardon from his government, he went to the Dutch East Indies, was employed there for some time as physician, and afterward explored the islands, especially Java, under the auspices of the government. His *Topographische und Naturwissenschaftliche Reisen* were edited by Nees von Esenbeck (Magdeburg, 1845). German and Dutch editions of his *Batalländer in Sumatra* appeared in Berlin and Leyden in 1847; and a German version by

Hasskari of his *Zurückreise von Java nach Europa* in 1851. His most important work, considered by many the best on the subject, treats of the botany, geography, and geology of Java (*Java, seine Gestalt, Pflanzendecke und innere Bauart*, 8 vols., German ed., Leipsic, 1852). A work is now in progress in which several naturalists are engaged, giving, under the title of *Planta Junghuhniana*, a description of plants and fossils which he discovered in Java.

JUNGMANN, JOZEF JAKOB, a Slavic philologist and author, born at Hudlitz, Bohemia, July 16, 1778, died in Prague, Nov. 14, 1847. From a poor farmer's boy he rose to the highest academical position at the university of Prague. Among his first literary labors were translations of Châteaubriand's "Atala" and Milton's "Paradise Lost," which Bowring calls "the most admirable among the many admirable versions of that renowned and glorious heroic." In 1820 he published a Bohemian chrestomathy (*Slownost*, 2d ed. 1845); in 1825 a history of the Bohemian language and literature (2d ed. 1848); and in 1835-'9 a complete Bohemian-German dictionary (*Slownik Cesko-Nemecky*), which is regarded as his most important work, and as worthy to rank with the best English and German lexicographical works. His patriotic devotion to the development of the Bohemian language and literature, the generosity of his disposition, and his great popularity as a teacher, have established for him a high reputation; and in 1860 it was proposed to erect a monument in his honor in the university buildings of Prague.

JUNIATA, a central co. of Penn., watered by Juniata river; area, 860 sq. m.; pop. in 1850, 18,029. It has a mountainous surface, with many fertile valleys. The productions in 1850 were 138,633 bushels of Indian corn, 187,187 of wheat, 102,498 of oats, 12,288 tons of hay, 262,085 lbs. of butter, and 14,686 of wool. There were 25 grist mills, 20 tanneries, 2 woollen factories, 2 iron foundries, 2 newspaper offices, 26 churches, and 2,000 pupils attending public schools. The Pennsylvania railroad and canal pass through Mifflintown, the capital.

JUNIATA, a river of Penn., formed near the centre of the state by the junction of the Little Juniata and Frankstown branch, which rise at the foot of the Alleghany mountains. Its general course is E., with many deviations; and after passing through a picturesque and mountainous country, it joins the Susquehanna 14 m. above Harrisburg. Including the Frankstown branch, it is about 150 m. long. It is not navigable. The Pennsylvania canal follows its banks throughout its whole course.

JUNIPER (*juniperus*, Linn.), a genus of evergreen trees or shrubs, with subulate or else scale-like, rigid leaves, belonging to the natural order of *coniferae*. The common juniper (*J. communis*, Linn.) is best known in America as a low shrub, spreading flat upon the ground, though sometimes rising to the height of from 2 to 8 feet. Its foliage consists of leaves arranged in threes, which are linear, awl-shaped, prickly

pointed, spreading, and of a bright green excepting the glaucous whitish hue of the upper surface. The berries are dark purple, about the size of a pea. The common juniper is regarded as identical with the juniper of Europe, though there, according to Loudon, it is known to have attained to the size and form of a tree. One figured in his *Arboretum Britannicum* was 20 feet high, with a trunk  $5\frac{1}{2}$  feet in circumference at the base. An instance of an altitude of 80 feet is also given. Such tall-growing forms average an annual growth of from 6 to 9 inches, until, having reached a height of 6 or 8 feet, the upward growth becomes slower, and their duration may be computed at more than a century. The leaves of the juniper have a strong and rather unpleasant taste, with a little astringency. The peculiar juice of the bark appears to consist of resin and volatile oil. The part mostly used in medicine is the berries; the medicinal powers may be regarded as residing in the oil, which these berries yield on distillation. The berries have long been employed for the purpose of a diuretic, particularly in dropsy, and of giving to gin their peculiar flavor.—The *J. Virginiana* of Linnæus is known as the red cedar or savin, and is a beautiful and picturesque tree, rising to a height of 15 to 30 feet, often covering rocky pastures, and yielding valuable timber from its trunk. Its foliage consists of 4-ranked, much crowded leaves; on young plants or rapidly growing twigs the leaves are awl-shaped and somewhat spreading in pairs or threes, but on the older lateral branchlets they are very small, scale-like, and imbricated. Its flowers are dioecious; the barren ones in small, terminal, oblong, yellowish-brown aments; the fertile ones minute in size, consisting of about 6 fleshy, bluish scales in pairs or threes, united at base, and containing one or two covered ovaries or germs; from the coalescing of these swelling germs is formed an obscurely 4-sided berry (*galbulus*), containing a seed or two covered with a bony shell. The red cedar, if pruned when young, may be made to have a smooth and straight trunk, and a handsome head. Sometimes individual trees may be observed, of handsome proportions, which have acquired these properties naturally. Others, upon bare and exposed hills, have short and thickened trunks, supporting broad, flat, and very picturesque heads. Others, exposed to strong winds blowing from the ocean, assume fantastic shapes. The wood is close-grained, smooth, compact, and durable. The sap wood is white, while the central portion of the trunk is of a beautiful red color, from which circumstance it receives its common name, although it is not a cedar. Its leaves are believed to possess the same medicinal properties as savin. A well known variety is the *J. comm. prostrata*, identical with the *J. repens* (Nuttall); this variety occurs on the banks of the Genesee river, N. Y., according to Dr. Bradley. The range of the species seems to be from the Saskatchewan in Canada, in lat.  $54^{\circ}$ , as far S. as Florida and

Louisiana, westward to the Rocky mountains, and in Bermuda and Barbados. The Bermuda red cedar, which has been found to be tender in Great Britain, is indigenous in the Bermuda islands, where it grows to a large tree, and its soft fragrant wood is employed in the manufacture of lead pencils.—The tall juniper (*J. excelsa*) was first discovered in Siberia by Pallas, and is a handsome evergreen with an upright trunk and slightly pendulous branches. The Chinese juniper (*J. Chinensis*, Linn.) is also a beautiful species with a dark green foliage.

JUNIUS, the signature of an English political writer, the author of letters which appeared in the London "Public Advertiser" newspaper between Jan. 21, 1769, and Jan. 21, 1772. As acknowledged in the first authorized collection, the series consisted of 44 letters by Junius and 15 by Philo-Junius, an auxiliary part being assumed under the second name for the purpose of supporting and defending the principal character, but with the design of being ultimately avowed. There have been preserved also 62 brief business letters which he addressed to Woodfall, the publisher of the "Public Advertiser," between April 20, 1769, and Jan. 19, 1772, and 10 letters written by him in private correspondence with John Wilkes between Aug. 21 and Nov. 9, 1771. To the same hand are attributed also 118 letters, on various political subjects and under different signatures, as Mneumon, Atticus, Lucius, Brutus, and Domitian, published in the "Public Advertiser" between April 28, 1767, and May 12, 1772. Some of these are of doubtful authenticity, and few of them are so elaborately finished and polished as the letters of Junius, to which signature he adhered for his most important addresses after the extraordinary effect produced by the first letter under it, apparently employing others when he wrote for explanatory and collateral purposes. The utmost period in which the agency of Junius can be traced is thus less than 6 years, and the period in which he wrote his acknowledged letters is about 8 years. These letters, directed against the ministry and the leading public characters connected with it, contain some of the most effective specimens of invective to be found in literature. Their condensed and lucid diction, studied and epigrammatic sarcasm, dazzling metaphors, and fierce and haughty personal attacks, made them at once attractive and appalling, and arrested the attention equally of the government and of the public. Not less startling was the immediate and minute knowledge which they evinced of court secrets, making it believed that the writer moved in the circle of the court, and was intimately acquainted not only with ministerial measures and intrigues, but with every domestic incident. They exhibited indications of rank and fortune as well as scholarship, the writer affirming that he was "above a common bribe" and "far above all pecuniary views." When Woodfall was prosecuted in consequence of Junius's letter to the king, the author promised to make restitution

to him of any pecuniary loss. The authorship of Junius was the greatest secret of the age. Every effort that the government could devise or private indignation prompt was in vain made to discover it. "How comes this Junius," said Burke in the house of commons, "to have broke through the cobwebs of the law, and to range uncontrolled, unpunished, through the land? The myrmidons of the court have been long, and are still, pursuing him in vain. They will not spend their time upon me, or you, or you. No; they disdain such vermin, when the mighty boar of the forest, that has broke through all their toils, is before them. But what will all their efforts avail? No sooner has he wounded one than he lays down another dead at his feet. For my part, when I saw his attack upon the king, I own my blood ran cold. I thought he had ventured too far, and there was an end of his triumphs, not that he had not asserted many truths. . . . But while I expected in this daring flight his final ruin and fall, behold him rising still higher, and coming down souse upon the two houses of parliament. Yes, he did make you his quarry, and you still bleed from the wounds of his talons. You crouched, and still crouch, beneath his rage. Nor has he dreaded the terrors of your brow, sir; he has attacked even you—he has—and I believe you have no reason to triumph in the encounter. In short, after carrying away our royal eagle in his pounces, and dashing him against a rock, he has laid you prostrate. King, lords, and commons are but the sport of his fury." The earl of Mansfield and other legal advisers of the crown had many consultations as to how this "mighty boar of the forest," as he was called by others beside Burke, could be most adroitly ensnared in the network of the law. The host of enemies whom he aroused in every direction were eager in plotting schemes for his detection. But, aware that his power and perhaps his personal safety depended upon concealment, he continued to astonish every one by his secret intelligence and to assail the government with undiminished intrepidity and rancor, revealing his apprehensions and precautions only in his private notes to Woodfall. His security was doubtless due in large measure to the forbearance and honor of this publisher, who followed strictly the imperative and precise orders of his correspondent. In one of his letters to a public character he gave as a reason for his concealment: "Though you would fight, there are others who would assassinate." In a letter to Woodfall he writes: "I must be more cautious than ever. I am sure I should not survive a discovery three days; or if I did, they would attain me by bill." In other letters he speaks with the utmost confidence: "As to me, be assured that it is not in the nature of things that they, or you, or anybody else should ever know me, unless I make myself known; all arts, or inquiries, or rewards would be equally ineffectual;" and in his dedication to the English nation he declared: "I am the sole depositary of my own secret,

and it shall perish with me." Junius appears to have written in a disguised hand. Various prescribed signals, as "O," "A letter," or a scrap of Latin poetry, were made to him in the notices to correspondents in the "Public Advertiser." Answers and parcels from the printer were left for him according to his orders in a great variety of places, addressed to different names. How much of the carrying part of the business was performed by himself is not certain; it is probable that when he employed another hand it was that of a porter who knew nothing of the contents or author of the packet with which he was intrusted. In a private note to Woodfall he complains: "Your letter was twice refused last night, and the waiter has often attempted to see the person who sent for it." A respectable authority affirms that he once saw a tall gentleman in a light coat, with bag and sword, throw a letter from Junius into the office door of Woodfall, and that he immediately followed the bearer until after a short distance he got into a hackney coach and drove off. Wilkes wrote on the first letter that he received from Junius: "Received by a chairman, who said he brought it from a gentleman whom he saw in Lancaster court, in the Strand." Who the person was who thus foiled the scrutiny of his own age has been the subject of more than 100 volumes or pamphlets, and of a vast number of essays in periodicals. He has been identified at different times with Sergeant James Adair, Col. Isaac Barré, Hugh Macaulay Boyd, Edmund Burke, Bishop John Butler, Lord Oamden, Lord Chat-ham, Lord Chesterfield, J. L. De Lolme, John Dunning (Lord Ashburton), Samuel Dyer, Henry Flood, Dr. Philip Francis, Sir Philip Francis, Edward Gibbon, Richard Glover, Henry Grattan, William Greustrake, George Grenville, James Grenville, William Gerard Hamilton, James Hollis, Sir William Jones, John Kent, Gen. Charles Lee, Charles Lloyd, Thomas Lord Lyttelton, Lachlan Maclearen, the duke of Portland, Gov. Thomas Pownall, Sir Robert Rich, John Roberts, the Rev. Philip Rosenhagen, Lord George Germaine (Viscount Sackville), Earl Shelburne, Earl Temple, John Horne Tooke, Horace Walpole, John Wilkes, Alexander Wedderburn (Lord Loughborough), Dr. James Wilmot, and Daniel Wray. Several of these laid claim to the honor of which they were ambitious, while the real author may have declined to accept a brilliant literary fame with the stigma of an almost fiendish malignity of character. The first attempt to fix the authorship upon Sir Philip Francis was made in 1816, by John Taylor, in his "Identity of Junius with a Distinguished Living Character Established," and it has from that time been more generally ascribed to him than to any other. According to Macaulay, "the case against Francis, or, if you please, in favor of Francis, rests on coincidences sufficient to convict a murderer." Beside numerous and constant coincidences in dates and circumstances, and resemblance of character and

handwriting, it should be observed that he never directly denied the charge. In answer to an inquiry, he wrote evasively: "Whether you will assist in giving currency to a silly malignant falsehood is a question for your own discretion." Lady Francis affirms that his first gift to her after marriage was an edition of Junius, which he bade her take to her room, keep from sight, and never to speak on the subject; and he made a posthumous present to her of a sealed copy of Taylor's "Identity of Junius," found in his bureau. According to her statement, also, Sir Philip made himself known as Junius to the king, Lord North, and Lord Chatham, under an engagement of secrecy, and received in consequence his Indian appointment; and the secret was faithfully kept by each of the contracting parties, who were equally interested in not divulging it.—Complete editions of his letters were published by George Woodfall, son of the original printer of them (8 vols., London, 1812 and 1814), to which an elaborate preliminary essay was prefixed by Dr. John Mason Good. A new edition (1850-'55), by John Wade, forming two volumes in Bohn's "Standard Library," contains the whole of Woodfall's edition, and an essay with new evidence concerning the authorship, which increases the strength of the claim made for Sir Philip Francis. The most complete bibliography of Junius is given in Lowndes's "Bibliographer's Manual," vol. iii. (London, 1860).

JUNIUS, FRANCOISCUS (FRANÇOIS DU JON), a scholar and philologist of French descent, born in Heidelberg, Germany, in 1589, died in Windsor, England, Nov. 19, 1677. His father, of the same name, celebrated for his Latin translation of the Scriptures in conjunction with Tremellius, commentaries, and other writings, was professor at Heidelberg and afterward at Leyden. Here the son studied mathematics with a view to the profession of a military engineer, and in 1608, after the death of his father, joined the army; but leaving it on the truce of 1609, he devoted himself to study and literature. In 1620 he went to England, and for 30 years filled the office of librarian to the earl of Arundel. During this period he studied the Teutonic languages, and came to the conclusion that the Gothic was the parent of them all. He published an edition of the Gothic Gospels of Ulphilas, with a commentary; but his greatest work was his *Glossarium Gothicum*, in 5 languages, the Saxon department of which has since been issued separately under the title of *Etymologicum Anglicanum*. He also wrote a treatise *De Pictura Veterum*, which he translated into English himself. In 1650 Junius visited Germany, and remained there for some years. He died while residing in the house of his nephew, Isaac Vossius. He bequeathed all his MSS. to the Bodleian library at Oxford.

JUNK (Portuguese, *junco*), a general name applied by Europeans to vessels navigating the seas of eastern Asia, and especially of China and Japan. The Chinese junks of commerce

are unwieldy flat-bottomed vessels, varying in length from 50 to 200 feet, and sometimes having a capacity of 700 or 800 tons. They have 3 masts, and a short bowsprit placed on the starboard bow; an elevated bow and stern; and sails of mats, which are run through with strong bamboo rods at the distance of every 2 or 3 feet, and are hoisted by a large rope. In large junks the main sail frequently weighs several tons. The rigging is of the rudest description, and the masts are frequently unsupported by shrouds. The anchor is made of a hard species of wood called iron wood. Junks sail well before a wind, but in general are not adapted for long sea voyages. The voyage of the Keying, a vessel of 700 or 800 tons, in 1847, to New York, whence she went to England, forms the first exception on record to this rule.

JUNO, called by the Greeks *HERA*, in ancient mythology, a daughter of Saturn and Rhea, and the sister and wife of Jupiter. At her marriage all the other divinities attended and presented the bride with gifts, among which was the tree with the golden apples which was consigned to the care of the Hesperides. She was treated with the same reverence by the Olympians as the father of gods and men himself, and styled the queen of heaven. She was surnamed (by the Greeks and Romans respectively) *Βασιλεια* and *Regina* as the celestial queen; *Γαμηλια* and *Pronuba*, as the patroness of marriage; *Ελευθια* and *Lucina* as presiding over childbirth. She was not, according to Homer, a very amiable, obedient, or devoted wife, and her jealousy, obstinacy, and violence often caused Jupiter to tremble on his throne. Having conspired with Neptune and Minerva to dethrone and confine him, Jupiter bound her with chains, and hung her up in the clouds. Juno was the mother of Mars, Hebe, and Vulcan. The chief seats of her worship were Argos, Samos, Sparta, and Rome. Her most celebrated Hellenic temple, situated near Argos, contained a colossal statue of the goddess, made of ivory and gold. At Rome her principal temple was on the capitol hill, and her great festival, the *matronalia*, was celebrated on the 1st of March by the wives and matrons of the city. Juno is usually represented in works of art as a woman of majestic mien, crowned, and sitting in a chariot, with a peacock beside her.

JUNOT, ANDOORÉ, duke of Abrantès, a French soldier, born in Bussy-le-Grand, Burgundy, Oct. 28, 1771, died in Montbard, July 29, 1818. He was educated for the law, but in 1792 enlisted in the army as a volunteer, and by his courage won the *sobriquet* of "the tempest." He attracted the attention of Bonaparte at the siege of Toulon, and a close intimacy sprang up between the two, Junot's devotion to his superior amounting almost to fanaticism. He accompanied Bonaparte to Italy as his aide-de-camp, and won the rank of colonel in the campaign of 1797. He distinguished himself in Egypt, and was made brigadier-general. A wound received in a personal encounter with a

brother officer, who was not as enthusiastic an admirer of Bonaparte as himself, delayed his return to France, and he landed at Marseilles on the day of the battle of Marengo. He was forthwith appointed to the command of Paris, and a few months later married Mlle. Laure de Permon, and received the rank of general of division. But his own as well as his wife's indiscretions were so distasteful to Napoleon, that in 1808 he removed Junot to the command of one of the corps of the "army of England." On the establishment of the empire, Junot was promoted to the rank of colonel-general of the hussars, received a pension of 30,000 francs, and a little later the grand cross of the legion of honor; but he could not conceal his disappointment at not having been placed among the first marshals of the empire. His dissatisfaction, his improper behavior and lavish expenditures, coupled with his wife's eccentricities, caused the emperor to send them for a while into honorable exile; and Junot was, in 1805, appointed ambassador to Lisbon, where he distinguished himself only by his ostentation. In the same year he went to Germany without permission, and arrived in time to participate in the battle of Austerlitz. In 1806 he was again appointed governor of Paris and commander of the 1st military division; but the same follies on his part led to the same result as before. He was sent to Spain to take command of the army that was to invade Portugal; here at least he showed his talent as a general, succeeded in taking possession of the country in the face of the greatest difficulties, and won by his gallant conduct the title of duke of Abrantès; but his success was soon checked by the arrival of Sir Arthur Wellesley with an English army. Junot was defeated at Vimiera, and constrained by the convention of Cintra, Aug. 23, 1808, to evacuate Portugal. Landed at La Rochelle with his troops by the English fleet, he immediately joined Napoleon, who took him back to Spain, where he was placed in command of the 3d corps, then besieging Saragossa. He participated in the campaign of 1809 in Germany, and in 1810 was sent back to the Peninsula, where he was severely wounded in the face by a bullet. In 1812 he commanded a corps of the invading army in Russia; but his slow operations did not satisfy the emperor, who, instead of employing him actively the next year in Saxony, appointed him commander of Venice and governor-general of the Illyrian provinces. This kind of disgrace, combined with other troubles and the suffering brought upon him by his old wounds, preyed so much upon his constitution that he became insane, and was taken to his father's house near Dijon, where he threw himself from a window and died from the effects of the fall.

**JUNOT, MADAME.** See **ABRANTÈS, DUCHESS OF.**

**JUNTA** (Sp.), in Spain, a name given to legislative assemblies or administrative councils. In the middle ages, the assemblies of the representatives of the nation, without any preliminary

call of the monarch, were termed general juntas. It was sometimes used as synonymous with cortes. Charles II. established a great junta to regulate and determine the competency of the inquisition. There was afterward a royal junta of commerce and the mines, and another of the tobacco monopoly. In 1808 Napoleon convoked at Bayonne under the name of a junta an assembly of 150 representatives of the nation (of whom only 90 appeared), for the adoption of a constitution which he wished to introduce into Spain. After the insurrection of the provinces several juntas were formed in them, which were finally absorbed in a central junta of 44 members; but provincial juntas reappeared in the subsequent revolutions. The same term was employed in the Spanish colonies which have become independent.—In English, the word *junto* designates a cabal formed usually for some sinister purpose.

**JUPITER** (Gr. Ζεύς), the greatest of the Greek and Roman gods, was a son of Saturn and Rhea, and the brother of Neptune, Pluto, Vesta, Ceres, and Juno. As Saturn used to devour his children as soon as they were born, his wife Rhea, when she found herself pregnant with Jupiter, entreated Coelus and Terra to save the life of the child. They advised her to flee with the infant to Orète, which she accordingly did, and concealed him in a cave of Mt. *Ægæon*. As he approached maturity Jupiter gave evidence of the divinity of his nature. He delivered the Cyclops from the bonds with which they had been fettered by Saturn; gave liberty to the hundred-handed giants Briareus, Cottys, and Gyes; subdued the Titans, and shut them up in Tartarus; and finally dethroned his father, and obtained the empire of the universe, which he shared with his brothers Neptune and Pluto, assigning the dominion of the sea to the former, that of the lower regions to the latter, and reserving for his own peculiar realm the heavens and the atmosphere; while over the earth and earthly beings the whole three exercised a joint rule. Jupiter fixed his residence on the summit of Olympus, and took successively to wife Metis, by whom he became the father of Minerva; Themis, who bore him the Horæ and the Parcæ; Eurynome, who was the mother of the Graces; Ceres and Mnemosyne, whose offspring were Proserpine and the muses; Latona, who became the mother of Apollo and Diana; and Juno, whose children by him were Mars, Hebe, and Vulcan. Jupiter was the most powerful of the heathen gods, the supreme ruler of mortals and immortals. Every thing good or bad proceeded from him, and at his pleasure he assigned a happy or an unhappy destiny to earthly beings. He was armed with thunder and lightning, and at the shaking of his shield the tempest raged, and the rain and the hail descended. His most distinctive epithets were *Ολυμπιος*, or Olympian, *Capitolinus*, from his principal temple at Rome on the Capitoline hill, and *Κεραυνιος*, or *Tonans*, "the thunderer." The most celebrated Hellenic temples of Jupiter were those of Do-

dona and Olympia, the latter of which contained the famous colossal statue of the god by Phidias. The eagle, the oak, and the summits of mountains were sacred to Jupiter, and his favorite sacrifices were goats, bulls, rams, and cows. Jupiter is generally represented sitting on a throne with a thunderbolt in his right hand, a sceptre in his left, and an eagle standing by him.

JUPITER AMMON. See AMMON.

JUPITER, THE PLANET. See ASTRONOMY.

JURA, an island off the W. coast of Scotland, belonging to the inner Hebrides, and separated from the mainland by a channel less than 2 m. wide; length 23 m., breadth 6 m.; area, 156 sq. m.; pop. in 1851, 1,064. A mountain range, whose highest peaks are termed the paps of Jura, traverses its entire extent, save where Tarbet Loch interrupts it. The aspect of Jura is wild, rugged, and inhospitable. There are no fertile valleys, but it has some excellent slate quarries, and a very fine sand for glass-making. Jura is famous for its red deer, and for caverns remarkable for their size and beauty.

JURA, an E. department of France, formed from a part of the old province of Franche-Comté, bounded N. by the department of Haute-Saône, N. E. and E. by Doubs and Switzerland, S. by Ain, and W. by Côte d'Or and Saône-et-Loire; area, 1,894 sq. m.; pop. in 1856, 296,701. The name is derived from the mountains which cover  $\frac{2}{3}$  of the department. The surface presents 3 divisions, viz.: the western part, consisting of a low plain about 7 m. in width; the first mountain elevation, rising suddenly from the plain and forming a plateau nearly 10 m. wide; and the high mountain district, consisting of lofty summits and deep valleys. The highest summits are Reculet, La Dôle, and Mont Poupet, which rise between 5,000 and 6,000 feet above the sea. Among the numerous rivers are the Ain, Loue, and Doubs, which are navigable. The Bienne is the most important of the smaller rivers. There are many marshes and lakes. The Rhone and Rhine canal traverses the N. part of the department, and railways run between Dijon and Besançon and several other places. Large quantities of squared timber are floated down in rafts to Lyons. The forests abound with pine and oak timber. Agriculture is highly advanced. The annual production of wine amounts to 8,000,000 gallons; the best wines are those of Lons-le-Saulnier and Poligny. Gold, copper, lead, coal, and iron are found. Lithographic stone, marble, and alabaster are quarried, and there are extensive salt works at Montmorot and Salins. The value of manufactured goods amounts annually to \$1,500,000, chiefly iron and iron wares. The department is divided into 4 arrondissements, Lons-le-Saulnier, Poligny, Sainte-Claude, and Dôle. Capital, Lons-le-Saulnier.

JURA, a range of mountains between Switzerland and France, extending about 180 miles in length from the waters of the Rhone in the department of Ain on the S. W. to those of the upper Rhine in a N. E. direction. The great

valley of Switzerland and the lake of Neuchâtel lie along its S. E. base, and over these from its summits may be seen Mont Blanc and the principal peaks of the Alpine chain. The Jura, like the Appalachian chain of the United States, consists of parallel ridges including narrow longitudinal valleys, along which the rivers flow in one or the other direction, occasionally passing through a break in the mountains into the next valley. In their external form, and the wave-like arrangement of the stratified rocks of which they are composed, the resemblance is still more striking. They occupy a belt of country of similar width, averaging about 80 miles; and the highest summits, which are mostly in the S. part of the range, attain about the same elevations as those of the Appalachian mountains in North Carolina. Mont Moleson is 6,588 feet high; Reculet de Toiry, 5,649; Mont Tendre, 5,588; Dôle, 5,509; Chasseron, 5,280; and Chasseral, 5,240. The principal strata are limestones of the oolite formation, named the Jura, from their abundance in this range, and with them are associated shales and sandstones, including beds of gypsum. The highest summits of the Jura lose their snowy winter covering in the summer season, and are then green with dense forests of fir. The growth below is in great part of walnut, groves of which surround almost every village. In the valleys are found some of the richest pasture lands in Switzerland, where are produced the Gruyère and other cheeses famed throughout Europe. Great numbers of cattle are reared and fed on the mountains. The Jura and the intermediate undulating country abound in wooded hills, among which rocky masses project at intervals, above the fertile slopes, which by the aid of irrigation yield 3 crops of grass annually. The most picturesque scenery is presented by the Val Montiers, or Münster Thal, between Basel and Bienne, the pass of Klus at the foot of the Ober-Hauenstein, and the lac de Joux.—The name Jura has also a wider application than to the mountain range above described; the continuation of the same limestone country through Swabia and Franconia being distinguished as the German Jura, situated between the Rhine and Main, and divided by the rivers Danube and Altmühl into 8 parts, viz.: the Black Forest Jura (*der Schwarzwald Jura*), situated between the Rhine and Danube; the Swabian Jura (*der Schwäbische Jura*), on the Danube and Altmühl, and designated by various names in various localities, as Ober-Hohenberg, Raube Alp, &c.; and the Franconian Jura (*der Fränkische Jura*), between the Altmühl and Main, traversed by the Ludwig's canal, and noted for its caves with bones of animals.

JURIEU, PIERRE, a French Protestant theologian, born in Mer, Orléanaise, in 1687, died in Rotterdam, Jan. 11, 1718. He was sent to England to complete his education under his maternal uncle, Peter du Moulin, and while in that country was ordained. On returning to France, he succeeded his father in the pastorate of the reformed church at Mer, and after-

ward was made professor of divinity and Hebrew at the academy of Sedan, where he remained until the institution was suppressed in 1681. He then retired to Rotterdam, where he became professor of theology, and minister of the Walloon church. He passed the remainder of his life in that city, engaged in bitter controversy with friends and enemies, especially Bayle, who openly charged him with religious indifference. Jurieu however got the better of the philosopher, and caused his dismissal from his professorship. He was a man of great learning, ability, and polemical tact, but extremely violent in his temper. He was the author of various works, highly esteemed in their day, though now almost forgotten. Of these the most important are: a "History of Calvinism;" a "History of the Opinions and Religious Ceremonies of the Jews;" a "Critical History of the Dogmas and Worship of the Church from Adam to Christ;" and a treatise "On Devotion."

JURY, a chosen body of men, whose duty it is either to judge and determine certain questions of fact submitted to them, or to inquire into the existence of certain alleged facts. Upon the jury a very large proportion of the whole procedure for the trial of actions in England and America rests. Its intrinsic importance has made the inquiries into its early origin and history interesting; and they are the more so, because they are found to be closely interwoven with investigations into the political, legal, and social institutions of many nations. Different writers have come to very different conclusions, perhaps because they began from different points of departure, and viewed their facts under different aspects. In almost all the results thus presented there is some truth; but we apprehend that they have erred in attributing the institution of juries to some one or two only of the many origins from which it has arisen, and the many influences which have combined to give to its present form in England and in the United States. Its principal source has been found in the *δικαστήριον* of Athens, or in the *judices* of Rome, or in the compurgators of the Saxons, or in the trial by the vicinage of the Romans, or in the Norwegian *Gulating*. We apprehend that it would be, if not impossible, at least so difficult to determine which among all these things may be considered as having contributed most to form the trial by jury, that the inquiry is not worth the time and labor it costs; for it must end in the conclusion that all have contributed, and importantly, to this result. The essence of the trial by jury is the determination of questions arising in actions at law by a select body of persons, who, without holding permanent judicial offices, come from among the people for this purpose, and, after their work is done, return to them. In Asia we find nothing of this at any time; and nothing of it in history, until the *δικαστήριον* of Athens was regulated if not introduced by Solon. The dicasts were a large body of men, numbering some thousands, who were selected or appoint-

ed from among the freemen of Athens, in some way under if not by the archons. From this large body a smaller number was selected, perhaps by lot, for each case, to hear and determine the questions which might arise in that case, under the direction of a presiding archon or other magistrate. Before proceeding to hear any case, they were sworn to discharge their duty faithfully. After hearing the case, they gave their votes by depositing them in urns or vases, from which the presiding magistrate took them and announced the verdict. Each dicast received from one to three oboli for his services. In this there is much resemblance to the jury of our own day; the principal difference being in the large number who sat in each case, which appears to have been sometimes as many as 500. This body the advocates addressed, beginning their speeches with *Ἀνδρες δικάσται* (as we see in Demosthenes, Æschines, and Lysias), in the same manner as our advocates say: "Gentlemen of the jury." It cannot be doubted, we think, that the judicial procedure of Rome was, to a great extent, derived from and formed by that of Athens. We are accustomed to translate the word *judez* by "judge," but there was no officer or magistrate known to the Romans who discharged precisely the duties which with us belong to the judge; the prætor came nearest to it; but *judez* would be much better translated by the word jurymen. When the plaintiff (*actor*) came before the prætor or other magistrate having jurisdiction, he made his complaint, and the defendant (*reus*) answered it. The prætor then referred the case to the *judices* to determine the facts; usually stating, in this reference, that such or such conclusions of law would follow from such or such conclusions of fact. The number of *judices* usually sitting is not known, and sometimes even an important case was tried before a single *judez*; as we know that Cicero delivered his oration *Pro Quintio* before one *judez*, assisted by a *consilium*. The *judices* generally were aided by jurisconsults who sat with them. The whole number of persons from whom could be selected the *judices* of each case was in Rome as in Greece large, amounting to some thousands; but by whom or on what principle it was appointed, or how or by whom the smaller number was appointed for each case, is not certainly known. There was sometimes an agreement of the parties as to the *judez* or *judices*, who were sometimes called *arbitri*, and who then answered to our arbitrators; and there was a method of objecting to *judices* appointed by lot or otherwise (*recusatio judicis*), which answered very exactly to our challenges. As we know that, as soon as Rome conquered a province, it introduced at once the provisions and the forms of its own law (its *jura et instituta*), in part perhaps because the province might be thus most effectually bound to the empire, and in part also because they were always better than those of the conquered nation; and as we know therefore that institutions, which resembled in

so many particulars our jury, were in full force in England for more than three centuries, it would seem to be unreasonable to deny them an important influence in creating the trial by jury. But, on the other hand, the Saxons brought into England the trial by compurgators. Then the party accused, or in later times the party plaintiff or defendant, appeared with his friends, and they swore, he laying his hand on theirs and swearing with them, to the innocence of the accused, or to the claim or defence of the party. Little is certainly known either of the origin or of the extent, in point of time or of country, over which the trial by compurgators prevailed; but it must have had great influence upon the subsequent forms of procedure. If in nothing else, it fixed the number of the traverse jury at 12, that being the common number of compurgators, whence the old mediæval phrase, *jurare duodecima manu*; and this was a great improvement on the varying and sometimes very large number in Greece and Rome. Beside this, however, recent investigation has shown, among the Norman legal usages, traces of trial by jury, more numerous, and more nearly resembling that trial as now conducted, than any thing known to have existed among the Anglo-Saxons. Moreover, it is now known that, with much variety of form, modes of trial essentially similar to that by jury prevailed among both the Teutonic and Scandinavian nations, from a very remote antiquity. We regard it therefore as certain that all these influences contributed to establish this mode of trial in England, and to shape it as we know it to exist there. Indeed, it was not until all of them had had an opportunity of completing their work, that we find what we should now call a jury certainly existing. Glanville represents it, in one of its most important forms and purposes, as introduced in the reign of Henry II.; he calls it "a royal benefit conferred upon the people by the goodness of the sovereign, with the advice of the nobility." So many of the attendant circumstances indicate that it was a Norman institution, bestowed upon his English subjects by a Norman king, that Sir Francis Palgrave has not hesitated to consider our jury trial as derived directly from Norman law.—One mistake in regard to a clause in *Magna Charta* is so common, and perhaps so important, that it should be corrected. The great charter says that no freeman shall be arrested or imprisoned, or exiled, or otherwise destroyed, *nisi per legale iudicium parium suorum, vel per legem terra*. This has been held to mean, "unless by lawful trial by jury;" and an argument has been drawn from it against the legality of any conclusive procedure against any person but on the finding of a jury. But the *iudicium parium* of *Magna Charta* did not mean a judgment or verdict of a jury. Even in *Magna Charta* itself we read of *juratores*; and the phrase *verdictum legalium hominum* and others by which a jury is indicated, are common in the law language of that day. But the *iudicium parium* was the peculiar and well known feudal

process, by which the lord with his vassals sat to try questions of title between others of his vassals. It is quite probable, however, that the alternative phrase, *per legem terra*, was intended to include trial by jury.—In Greece and Rome, in the Teutonic and Scandinavian nations, and probably among the Normans, the agreement of a majority of a jury, or of the body which represented a jury, was sufficient; but from the earliest times unanimity has been required in an English traverse jury, and the same rule is applied with the same strictness in this country. The origin of this peculiarity is quite unknown. The most plausible conjecture, for which indeed there is some authority, is, that originally there were or might be more than 12 jurymen, but the agreement of that number was required; and when the number of the jury finally settled down at 12 and no more, unanimity became requisite. There have been, in perhaps all ages, doubts whether the advantages of this rule were sufficient to compensate for the mischiefs which sometimes result from it; and these doubts have gone so far, that Lord Chancellor Campbell has introduced before the British parliament a bill providing that verdicts founded upon a certain majority of the jury might, in some specified cases, be sufficient. But this proposed change has not as yet found favor with the parliament; nor has any thing like it been enacted, or even formally proposed, so far as we know, in the United States.—There is, in respect to the evidence on which a jury acts, a circumstance strikingly illustrative of the change which has taken place in the constitution and in the functions of a trial jury. Now, they have nothing to do but to hear and weigh the evidence offered to them in open court; any thing beyond this is a departure from their duty; and if one of their number happens to know any thing about the facts of the case, he ought not to communicate it to the others, and they ought not to be influenced by it, unless he is sworn as a witness and examined as a witness; so anxious is the law to keep from the jury all evidence which does not rest upon an oath, and has not been submitted to examination. It is, however certain that, in the beginning of jury trials, and until the 15th century, the jury themselves were the witnesses, and the only witnesses, they being selected to determine the questions of the case because they were supposed to know the facts, and no other witnesses being examined, and no evidence whatever being offered to them. Nor was it until about the middle of the 16th century that there is any trace of any process known to the law for the summoning of witnesses. (See *Summers vs. Mosely*, 2 Crompton and Meeson, p. 485.)—As the jury must not pay any attention to any evidence not lawfully before them, so they must not go beyond the evidence, and inquire into the law, for that is the exclusive province of the court. In civil cases, no one has ever doubted this; that is, no one has ever doubted that in civil cases

it was the duty of the court to state the law to the jury, and the duty of the jury to receive and obey the law thus given to them. But of late, a question has arisen in regard to criminal trials, which has assumed, at least in many of the United States, an aspect of much importance. There are those who insist that in all criminal cases the juries shall be judges of the law as well as of the fact; and a year or two since a statute was enacted by the legislature of Massachusetts, which was intended to have this effect.—Juries are either grand juries or petit juries. Nearly all that has been said in this article relates only to petit juries, which are sometimes called traverse juries, and sometimes trial juries. A grand jury tries no question, and finds no verdict. The proper authority of the state, usually the attorney for the government, brings before the grand jury a case of supposed crime or wrong, with a bill of indictment, and the evidence on the subject. This they consider *ex parte*, or without hearing the accused; and if they think that the evidence is sufficient, they approve or “find” the bill, and present the accused to the court. If they do not think it sufficient, they “ignore” the bill (as it is termed), and no indictment is presented. The usual method of “finding” a bill is for the foreman (whom the jury choose) to write on the back of the bill: “A true bill,” with his signature and the date; and when a bill is rejected, the foreman writes upon it: *Ignoramus*, with signature and date. Sometimes the government attorney prepares no bill, but brings before them the case and evidence, and prepares a bill only when they direct him to do so. The grand jury are the exclusive judges of the weight and force of the testimony offered before them. The grand jury is generally more numerous than the petit jury. The more usual number is 28; originally it was 24, but as unanimity is not necessary, although at least 12 must agree to an indictment, to avoid the inconvenience of having 12 for and 12 against a bill, one less than 24 is the common number. Beside bills of indictment, and specific offenders, the grand jury may present to the court any public wrongs they think should be brought to its notice, and sometimes exercise a wide liberty in this respect. None are present with the grand jury during their deliberations but the officer of the government; and it is a part of their oath that they shall keep secret “the commonwealth’s counsel, their fellows’, and their own.” But there is a reasonable limit to this, for it is no uncommon thing for a grand juror to take the witness stand in a trial of a case, and testify as to what some person has said as a witness before the jury. A grand jury constitute a regular body, recognized as such by the law, having what may be called a jurisdiction coextensive with that of the court to which they make presentments.—Jurors, both grand and petit, are returned by the sheriff of each county (or, for the U. S. courts, by the marshal of each district), in obedience to a writ, called a *venire*,

which commands him to summon “to come” (*ut facias venire*, in the old law Latin) to the court at the appointed time the proper number of persons. The authorities of every city and town, or sometimes county, put into a box the names of all persons therein qualified and bound to serve as jurors. Usually these are all persons qualified to vote, with some special exemptions. When notice is given them to select and return the names of jurymen, the proper officer (as determined by statute or usage) draws a name from the box; and if persons are wanted both for grand and petit juries, usually the first 28 drawn are returned as grand jurors, and those that come after are for petit jurymen, until the necessary number is made out, which is usually enough to supply two or three juries. The names of these persons are given to the sheriff or marshal, and entered by him in the return of his *venire*. As no one can be called upon to discharge this duty, which is sometimes very burdensome, oftener than once in a certain number of years (usually three), when any one’s name is drawn, the day is indorsed upon the paper; and if it be seen that the same person has been drawn within three years, the paper is put back into the box and he is considered as not drawn. The whole list or schedule of a jury is called the “panel.” (In the Scotch law, the word “pannel” means the accused, or the party on trial.) The grand jury is “impanelled” when sworn and organized. A petit jury is impanelled when the names are called over, and the first 12 who are present, and are not excused or objected to, are sworn, and set apart as the jury. It is common in most of our courts having much business to impanel two juries; that sitting on the right hand of the court being called “the first jury,” and that on the left hand “the second jury.” Sometimes, though very seldom, and only when the urgent pressure of business requires it, a third jury is impanelled. The purpose in impanelling more than one jury is, that while one is charged with a case and is deliberating, another case may be tried before another jury. Upon trials before a jury, the court are the exclusive judges of the admissibility or competency of evidence; but if it be admitted, the jury are the judges of its value.—We may remark that the institution of the grand jury certainly existed, substantially the same or nearly the same as at present, among the Saxons; and it is from this grand jury that some suppose the petit or trial jury to be derived; and doubtless this is in some degree true.

JUSSIEU, Dr., a French family of natural philosophers who have been styled the “botanical dynasty” of France. The most celebrated are the following: I. ANTOINE, born in Lyons, July 8, 1686, died in Paris, April 22, 1758. After taking the degree of M.D. at Montpellier, and travelling with his brother Bernard in Spain and Portugal, he went to Paris in 1708, where he commenced practice, was appointed professor of botany at the king’s garden, entered the acad-

emy of sciences in 1711, and contributed several papers to the *Mémoires* of that learned society, the most curious of which is perhaps his *Recherches physiques sur les pétrifications qui se trouvent en France de diverses parties de plantes et d'animaux étrangers*. In the course of a journey through southern France and Spain he made a valuable collection of plants previously very imperfectly known. In 1720 he gave to Desclieux, a young officer in the French navy, a small coffee tree, which, being transplanted to Martinique, was the means of introducing the cultivation of coffee into the French West Indies. Among his published essays is a *Discours sur les progrès de la botanique* (Paris, 1718). He edited Barrelier's posthumous work, *Plantas per Galliam, Hispaniam, et Italiam Observata, Iconibus Aeneis Exhibita* (Paris, 1714), and published a new edition of Tournefort's *Institutiones Rei Herbariae*, with an appendix (Lyons, 1719). His *Traité des vertus des plantes*, a synopsis of the lectures which he delivered at the faculty of medicine, was published by Gandonoger de Foigny in 1772. II. BERNARD, brother of the preceding, born in Lyons, Aug. 17, 1699, died in Paris, Nov. 6, 1777. He was graduated at Montpellier, joined his brother in Paris, and in 1722 was appointed assistant demonstrator of botany at the king's garden. A man of contemplative disposition, abstemious habits, and no ambition, he never rose above this subordinate office, but gradually obtained the reputation of one of the first botanists in Europe. In 1725 he edited Tournefort's *Histoire des plantes des environs de Paris*, with additions and annotations, which were considered so valuable that he was made a member of the academy of sciences, although he was only 26 years of age. To the *Mémoires* of that academy he contributed very few papers, and these on subjects of secondary importance, but remarkable for precision, ingenuity, and thorough method. He devised a system of classification based upon the natural affinities of plants, and applied it in 1759 to the arrangement of a botanical garden at Trianon, which had been ordered by Louis XV. The catalogue which he drew up on this occasion has been considered by competent judges as the foundation of the "natural system," afterward expounded by his nephew Antoine Laurent. The respect with which he inspired his contemporaries extended beyond the limits of his native country; and Linnaeus himself entertained the highest opinion of his acquirements. III. ANTOINE LAURENT, nephew of the two preceding, born in Lyons, April 12, 1748, died in Paris, Sept. 17, 1836. He was called to the metropolis in 1765 by his uncle Bernard, and studied medicine, but ultimately devoted himself to botany, in which, under Bernard's directions, he attained great eminence. As early as 1773 he presented to the academy of sciences a *Mémoire sur les renouclacées*, in which the first principles of the "natural system" are clearly perceptible; and the next year he reduced the system to practice in the replanting

of the botanical division in the king's garden. In 1778 he had so thoroughly matured his plan that he undertook the publication of his great work, *Genera Plantarum secundum Ordines Naturales disposita, juxta methodum, in Horto Regio Parisiensi exaratum, anno 1774*, which was not completed until 1789. To bring together all those plants which are allied in all essential points of structure, and to take into account the true affinities of plants on a comparison of all their organs, is the leading feature of the "Jussieuan system," which has finally triumphed over the artificial or sexual system of Linnaeus. In 1790 he was elected a member of the municipal council of Paris, and intrusted with the supervision of the hospitals and charities, which office he held for two years. In 1793, when the king's garden was reorganized as the museum of natural history, he was raised to a professorship, and while he held the office of director of that institution he laid the foundation of its library, which is one of the best, if not actually the best of its kind in Europe. In 1804 he was appointed professor of *materia medica* at the faculty of medicine, and life member of the council of the university, but was deprived of both these offices during the restoration. In 1826 his failing health and partial blindness caused him to resign his chair of botany at the museum in favor of his son Adrien. He preserved to the last his love of science and clearness of mind. He was very desirous of publishing a new edition of his *Genera Plantarum*, in which all the recent discoveries were to be embodied; but, unable to achieve so vast an undertaking, he contented himself with improving certain parts of it in a series of invaluable papers published from 1804 to 1820 in the *Annales du muséum*. Beside the works above mentioned, he is the author of several historical notices of the museum of natural history, and a number of valuable articles on botany in the *Dictionnaire des sciences naturelles*, among which the one upon the "Natural Method of Plants" deserves to be specially noticed. IV. ADRIEN, son of the preceding, born in Paris, Dec. 28, 1797, died June 29, 1858. On taking his degree of M.D. in 1824, he defended a thesis *De Euphorbiacearum Generibus*. He succeeded his father as professor at the museum in 1826, and soon achieved a distinguished rank among botanists by his lectures and publications. In 1831 he was elected to the academy of sciences, and in 1845 was appointed to the chair of the organography of plants at the Sorbonne; his lectures there, which he continued till the time of his death, were both brilliant and attractive. His most important work is a *Cours élémentaire d'histoire naturelle : Partie botanique* (Paris, 1848), which is by far the best elementary treatise on botany. An English translation by I. H. Wilson, under the title of "Elements of Botany," was published in London in 1849. His treatise on botanical taxonomy, which appeared in 1848, in the *Dictionnaire universel d'histoire naturelle*, is also very val-

able. Among his papers printed either in the *Annales du muséum* or the *Comptes rendus de l'académie des sciences*, one of the best is his *Monographie des malpighiacées* (1848).—A very interesting essay, *De la méthode naturelle et des Justes*, was published by P. Flourens in his *Éloges historiques*, 2d series.

JUSTE, THÉODORE, a Belgian historian, born in Brussels in 1818. He is secretary of the Belgian board of education and member of many learned societies, and has popularized historical knowledge in his native country by a series of works on French, Belgian, and general history, the principal of which are: *Histoire élémentaire et populaire de la Belgique* (Brussels, 1888; 8d and enlarged ed. 1848); *Précis de l'histoire moderne considérée dans ses rapports avec la Belgique* (1845); *Histoire de la révolution Belge de 1790* (8 vols. 12mo., 1846); *Précis de l'histoire du moyen âge* (5 vols. 12mo., 1848); and *Les Pays Bas sous Philippe II.* (2 vols. 8vo., 1855).

JUSTICE OF THE PEACE. In the English law, justices of the peace are "judges of record appointed by the king's commission to be justices within certain limits, for the conservation of the peace and the execution of divers things comprehended within their commission and within divers statutes committed to their charge." Before the institution of this office there existed in England by the common law certain officers appointed for the maintenance of good order, and called *conservatores pacis*, keepers of the peace. Some of them exercised their functions by virtue of their tenures, and some by virtue of their offices; others were chosen by the freeholders of their counties. The period at which this office ceased, and justices of the peace were first created, has been disputed; but the better opinion seems to fix it at the beginning of the reign of Edward III. At that time the new king, fearing that some risings or other disturbances might take place in protest against the manner of his accession to the crown, sent writs to all the sheriffs in England commanding that peace be kept throughout their bailiwicks on pain and peril of disinheretance and loss of life and limb; and in a few weeks after the date of these writs it was ordained in parliament that, for the better maintaining and keeping of the peace in every county, good men and lawful which were no maintainers of evil or barrators in the county should be assigned to keep the peace. (Black. Com. i. 350.) From that time the election of the conservators of the peace was taken from the people, and their creation resided thenceforth in the assignment of the crown. It was only, however, by subsequent statutes that the conservators of the peace acquired a judicial character and functions. By 4 Edward III. c. 2, they were empowered to "take indictment," and by 34 Edward III. c. 2, they were commissioned to "hear and determine" in cases of felonies and trespasses. It is probable that not until then were these officers called justices. The office, as constituted and defined by these and

later statutes, occupies an important place in the English judicial system. It was adopted in the several states of this country at their settlement, and may be considered to possess here the general character and functions allowed to it in England by force of statutes. But it is to be remarked that in all the states legislative enactments have so fully enumerated the powers and duties of justices of the peace, both in civil and criminal affairs, as perhaps to preclude reference to the English law on the subject.—Justices of the peace are in some states elected by the people, and in others receive their appointment from the executive. Their jurisdiction is determined by their commissions and the provisions of various statutes. These are to be strictly construed, and no authority can be implied. Without attempting a recital of all the particular functions exercised by these officers, it will suffice for our present purpose to mention, under their criminal jurisdiction, that when they are not limited by the existence of special courts, they possess still their ancient common law powers as conservators of the peace, and as such may suppress riots and affrays and apprehend all disturbers of the peace. Then they may punish them by fine, and take recognizances for their future good behavior. By virtue of their criminal authority they may also issue their warrants for the arrest of offenders. If the offence be a trifling one, they may themselves determine in the matter. If, however, it be of an aggravated nature, they commit or bind over the criminal for trial in a regular court. They may judge in civil suits when but a small amount is involved, but not generally if any title to real property comes in question. As further examples of their usual powers, it may be added that they may issue summonses for witnesses to appear in their own courts, and to answer in civil suits pending before other courts; they may administer oaths in all cases in which an oath is required; they may celebrate marriages; and may make examinations and issue warrants in cases of bastardy. They also exercise certain functions under the poor laws. The justice must have jurisdiction of the parties and of the matter, or his interference is a trespass. But when he acts within his jurisdiction and by color of his office, he is not responsible in a civil suit for his acts. An action lies against him only when he has acted from corrupt or malicious motives. He may be impeached, and in some states removed by petition and hearing of the charges made against him before a higher court. A justice must keep a record of his proceedings, and may adjourn his court from day to day. The pleadings before him are, for the benefit of suitors, treated with great liberality.—In the decree for the reorganization of the judicial system of France (Aug. 24, 1790) *juges de paix* were created in imitation of the English officers of the same name. They were to decide summarily, without expense to suitors and without

the intervention of counsel, affairs of slight importance, and especially those which involved disputed facts rather than contested points of law. The decree of Sept. 1791, concerning criminal procedure, invested the *juges de paix* with police functions; at a later period they were called to the presidency of those police tribunals which took cognizance of minor offences. Under the law of May 25, 1838, the French justices are empowered to decide finally in all causes purely personal, and involving no more than 100 francs, but subject to appeal in all such causes from 100 to 200 francs. With similar limitations they have jurisdiction in actions between landlords and tenants; in suits for damages to fields, fruits, and harvests; between laborers and their employers; and between servants or apprentices and their masters; and in civil suits for verbal defamation, and in those breaches of the peace and assaults which are not expressly provided for in the criminal law. Their decrees are subject to appeal in all possessory actions, in cases involving questions of boundaries, and in those arising out of the use of mill privileges and streams applied to irrigation. As officers of the judicial police and auxiliary to the prosecuting officer of the government (*procureur du roi*), they received informations and made examinations into charges of flagrant crime committed within their jurisdiction. These justices were required to hold at least two sittings a week, though they might at their election hear causes every day. They must decide at the first hearing, unless in exceptional cases.

JUSTIN (FLAVIUS ANICIUS JUSTINUS). I. Surnamed the Elder, Byzantine emperor, born of a family of barbarian peasants near Sardica, now Sophia in Bulgaria, in 450, died in 527. Too ambitious to follow the modest pursuits of his parents, he started with two other youths on foot for the capital to enter the army, and on account of his strength and stature was placed among the guards of the emperor Leo I. Under the following reigns of Zeno and Anastasius he emerged to wealth and honors. Having served in the Isaurian and Persian wars, and been promoted successively to the ranks of tribune, count, and general, and the dignity of senator, he was commander of the imperial guards at the time of the death of Anastasius (518). The eunuch Amantius, who then reigned in the court, being bent on setting one of his creatures, Theodatus, on the throne, intrusted an ample donative to Justin with which to gain the suffrage of the guards for his purpose. Justin employed the bribe in his own favor, and was proclaimed emperor at the age of 68. Brave, but ignorant, according to Procopius, even of the alphabet, he intrusted the quæstor Proclus with the affairs of the state, and adopted Justinian, his nephew and a native of his village, who, however, was educated in Constantinople. Amantius was executed on charges of conspiracy and heresy, Theodatus was murdered in prison, and Vitalian, a Gothic chief, who had become popular by his civil war against Anas-

tasius in defence of the orthodox faith, was treacherously murdered. Both Justin and his successor Justinian (during part of his reign) were defenders of the orthodox creed. II. The Younger, nephew of Justinian, succeeded him in 565, adopted Tiberius II. as co-emperor in 547, and died in 578. He was a man of good dispositions, but weak and sickly, and his reign was marked by numerous calamities, the greatest of which was the conquest of Italy by the Lombards under Alboin, after the removal of Narses, who had reconquered it from the Ostrogoths.

JUSTIN (JUSTINUS), a Latin historian, of uncertain date, and of whose personal history nothing is known. It is probable that he lived at Rome in the 3d or 4th century. He is the author of a work entitled *Historiarum Philippicarum Libri XLIV.*, founded on a lost work of Trogus Pompeius, a historian of the Augustan age. The original work, though professing to give only an account of the Macedonian monarchy, was hardly less than a universal history, and was of great value. Justin seems rather to have compiled selections from it than to have abridged it systematically, and his history contains a great variety of information that would not otherwise have been preserved, carelessly arranged, but written in a clear and sometimes elegant style. The latest editions are those of Frotscher (Leipsic, 1827) and Schwarz (Stuttgart, 1834-'6). The English translations are by Codrington (1664), Brown (1712), Bayley (1732), Clark (1732), and Turnbull (1746).

JUSTIN MARTYR (*Iovittios ὁ Μάρτυρ*), one of the earliest of the church fathers, born in Flavia Neapolis (Shechem), in Samaria, martyred at Rome under Marcus Aurelius about 165. The year of his birth is variously conjectured to be 89, 108, 114, or 118. In his youth he studied with enthusiasm the Greek systems of philosophy, and was successively a stoic, a peripatetic, and a Platonist. He relates that while meditating by the sea on the Platonic doctrine of ideas he met with an old man, of meek and venerable aspect, who proved to him that Plato, though the most illustrious of heathen philosophers, was ignorant of many things, and recommended to him the study of the Hebrew prophets. This conversation resulted in his conversion, and, though he retained the garb of a philosopher, he devoted himself to the propagation of his new faith and to defending by his writings the character and principles of the Christians. On a visit to Rome he was arraigned during the persecution under Marcus Aurelius, and when he refused to sacrifice to the gods was sentenced, according to one account, to be scourged and beheaded, and according to another to drink hemlock. His name appears in the calendar of both the Greek and Latin churches, and the church of San Lorenzo at Rome and that of the Jesuits at Eystadt both claim to possess his body. He was one of the first who sought to reconcile philosophy and Christianity. Among his works are a plea for the Christians addressed to the emperor Anto-

nius Pius under the title of an apology, which is one of the most interesting remains of Christian antiquity; a second apology, addressed probably to Marcus Aurelius; and a dialogue, in which he maintains Christianity against the objections of Trypho, a Jew. Many other writings of doubtful authorship are attributed to him. The best edition of his complete works is that by Otto (8 vols., Jena, 1848-50). His apologies were translated into English by Reeve (3 vols., 1809), and the dialogue with Trypho by Brown (1755).

**JUSTINIAN I.** (FLAVIUS ANICIUS JUSTINIANUS), surnamed the Great, a Byzantine emperor, born in 482 or 483 at Tauresium, a village near the ruins of Sardica, now Sophia in European Turkey, died Nov. 14, 565. He was the son of a poor Slavic family, but his elevation was promoted by his uncle, who after a life of military service ascended the throne of the Byzantine empire in 518, under the name of Justin I., and shortly before his death in 527 adopted his nephew as co-emperor at the request of the senate. Justinian, who on good grounds is suspected of having effectively aided in the commission of various crimes by which his uncle obtained and secured the imperial diadem, was possessed long before the decease of the latter of all power in the state, as well as of a large private fortune. He shared both his power and wealth with Theodora, a beautiful, crafty, and unscrupulous woman, the daughter of a keeper of wild beasts, who had been long known as a comedian and prostitute, and despised by the people of the capital as the vilest of her sex. Having married her in spite of all objections on the part of the court, he not only seated her on his throne, but also made her an equal colleague in the sovereignty of the empire; and her demoralizing, corrupting, and despotic influence remained powerful till her death in the 22d year of their reign. In the chief subjects of agitation which at that time distracted the empire, the questions of creed in the church and of color in the games of the charioteers in the hippodrome, Justinian and his wife were agreed in zealously supporting the orthodox and the blue parties. In the capital and most of the provinces heresy was totally powerless, but the faction of the greens was often able to resist by open violence the arrogance of their opponents and oppressors. In 532, after a fierce contest between the factions, in which Constantinople was almost laid in ashes, they momentarily combined their forces against the government, and proclaimed Hypatius, a nephew of the emperor Anastasius, emperor. The resolute spirit of Theodora and the faithful bravery of the general Belisarius triumphed. The blues returned to allegiance, the greens were crushed with dreadful slaughter, Hypatius and his principal accomplices were executed, and tranquillity was restored. Justinian now turned his chief attention to the external interests of his vast state. Purchasing at an immense sum a truce from Chosroes I. of Persia after a war

of a few years waged with varying success, he sent Belisarius with a fleet against Gelimer, who had usurped the sovereign power in the kingdom of the Vandals of Africa, and as an Arian ruler oppressed his Catholic subjects. The fleet sailed from Constantinople in June, 533, and after a voyage of 8 months the army disembarked in the vicinity of Carthage, and a series of victories soon brought that capital and the person of Gelimer himself into the power of the Byzantines. Gelimer was sent a captive to Constantinople, the kingdom of the Vandals destroyed, and the Arian worship suppressed. Calumniated at the court, however, the heroic conqueror had to vindicate his honor before his masters, but was allowed the honors of a triumph. The conquest of the province of Africa, to which was added that of the adjoining provinces, not only procured new influence and some strong stations in Spain, but also paved the way for the reestablishment of the Roman imperial power in Italy, where Athalaric, the profligate young grandson of Theodoric the Great, the founder of the Ostrogothic dominion, having died, his mother, the regent Amalasontha, for some time usurped the reins of power, but was soon murdered and succeeded by her unworthy colleague and 2d husband, Theodatus (535). Belisarius successively reduced Sicily, crossed over to Rhegium, and conquered Naples; Theodatus was deposed by his people and assassinated; Rome opened its gates to the army which fought in its name (536). Vitiges, the successor of Theodatus, tried in vain to reconquer that metropolis, and soon had to take refuge in the morasses and within the walls of Ravenna, which was reduced by the arms and diplomatic skill of the imperial general (539). But Justinian again listened to the voice of envy, and recalled the conqueror, who readily obeyed. As Chosroes had broken the truce and invaded Syria (540), Belisarius was sent against him, and in two successive campaigns, without striking a blow, induced the enemy to return to his own dominions. After a short disgrace, he was again sent to Italy, but without an army, to restore the fortunes of the war, which had been renewed there by the new king of the Goths, the brave Totila. The latter had nearly reconquered the whole country, and Rome was besieged. Belisarius made a vain attempt to relieve it; the city was taken, and was to be destroyed (546), when the conqueror yielded to the remonstrances of his antagonist, who soon after reoccupied and fortified the deserted metropolis of the world. Ignoble intrigues, however, again checked Belisarius in his movements, and finally deprived him of his command (548). Totila again took Rome (549). Justinian, however, found another great general in the eunuch Narses, and in 552 once more received the keys of the ancient capital, which in his reign had been 5 times taken and recovered. Totila had fallen in the battle near its gates, and his successor, Teias, the last of the Ostrogothic kings, shared the same fate in the following year.

Another great victory of Narses over the Franks and Alemanni, who then invaded Italy, secured the possession of that country, which he governed as exarch, residing in Ravenna. Belisarius ended his military career by saving Constantinople from an invasion of Bulgarians and Slavi (559). In the East, Justinian terminated a protracted war with the Persians about the possession of Colchis or Lazica by a peace (561), in which Chosroes extorted the ignominious promise of an annual tribute. The northern frontiers of the empire were in part secured against the invasions of the barbarians by similar treaties, and a vast line of fortifications, especially along the Danube, was added from a feeling of precaution which the degeneracy of the empire made but too natural. The imperial armies themselves consisted mainly of barbarian hirelings. In the interior the reign of Justinian was marked by tyranny, extortion, and lavish expenditure, especially in the erection of sumptuous buildings, of which the rebuilt church of St. Sophia was the most magnificent; by a continual meddling in the affairs of the church, and the severe persecution of heretics, Samaritans, Jews, and pagans, involving the dissolution of the Athenian schools of philosophy; and by uninterrupted intrigues at the court, which, among others, finally succeeded in ruining Belisarius. Justinian, however, who was fond of studies as well as of arts, has the great merit of having, through Tribonian and other lawyers, prepared that code of Roman laws which bears his name and is the great monument of his reign. (See CIVIL LAW.) The introduction of silkworms from China through some missionaries, who brought the eggs of the useful insects in hollow sticks, is another of its lasting merits. Justinian was patient, frugal, and diligent, but vain, selfish, and ungrateful. "He was neither beloved in his life nor regretted at his death."

**JUTE**, a fibrous material, described as a grass, in appearance like a coarse flax, exported from the East Indies for the manufacture of mats and carpets. It is used of the natural color and also dyed. In and about Dundee, Scotland, there are 76 mills engaged in spinning jute and flax, one of which is the largest mill in Scotland, employing 2,000 hands in working jute alone. The raw material costs only about 11s. per cwt.; the carpets sell for 7d. to 11d. per yard, and the mats at about 3s. each. The fibre is soft, silky, and easily spun, but lacks strength, and moreover is liable to decay rapidly, particularly if exposed to dampness. The exportations of this article from Calcutta alone amounted in the years 1850 and 1851 to the value of £200,000; and the annual consumption in England is estimated at 100,000 bales, valued at £20 each. It is made into "bagging" for cotton bales, and finally finds its way to the paper mills for the manufacture of coarse wrapping papers. The finer fibres, resembling caterpillars' thread, are used to adulterate silk.

**JUTECALPA**, a town of Honduras, capital of the department of Olancho; pop. 4,500. It

is the centre of a large cattle-growing and gold-washing district, and some of its inhabitants are engaged in mahogany cuttings on the rivers Roman, Patuca, &c., which rise in its vicinity and flow N. into the bay of Honduras. About \$150,000 in gold dust, 30,000 hides, and a considerable quantity of liquidamber, are sent abroad annually from this town. Large droves of cattle are also driven thence into the republics of San Salvador and Guatemala. Far removed from the centres of political strife, it has suffered less than any other Central American town from the partisan contests of the country.

**JUTLAND** (Dan. *Jylland*), an irregular peninsula, forming the chief part of the kingdom of Denmark, bounded N. by the Skager Rack, E. by the Cattegat, the Little Belt, and the Baltic, S. by Holstein, and W. by the North sea. It comprises the circle or province of North Jutland or Jutland proper, and the duchy of Schleswig, sometimes called South Jutland. It is the ancient Chersonesus Cimbrica, and the country of the Jutes. The Jutes were a Teutonic or Scandinavian tribe, of whose presence in this quarter we have evidence as early as the 5th century. According to Mannert, they were identical in race with the Guthi of Ptolemy, and came from the opposite Scandinavian coast. They were the earliest Germanic invaders of Britain after the departure of the Romans. —The circle of Jutland lies between lat. 55° 28' and 57° 44' N., long. 8° 5' and 10° 57' E.; area, 9,696 sq. m.; pop. in 1858, 648,287, all Danes excepting a few German settlers. It is divided into 4 dioceses or districts, which are subdivided into 10 bailiwicks. The capital is Viborg. The N. and part of the W. coast are low, flat, and sandy, presenting long lines of dangerous banks, broken on the W. by several large fiords which may be said to form lagoons. The E. shores are more rocky and have some good harbors. The Lym fiord entirely insulates the N. part of the circle. There are many ponds and marshes scattered over the surface, but few rivers. The largest streams are the Guden, which flows into the Cattegat, the Lonborg, which enters the Ringkøbing fiord, and the Kolding and Konge, which separate Jutland from Schleswig. There are no mountains, and the hills are little more than accumulations of sand, seldom exceeding 100 feet in height. The soil on the E. and W. is fertile, but the central districts are sandy and sterile, and the N. coast is covered with drifting sands, which are planted with reeds to prevent them from being borne by the wind over the cultivated lands. On the E. there are some groves of oak, fir, and birch, but the province has been nearly stripped of its timber. Agriculture is in a very low state, but efforts have been made with some success to improve it. The industry of the inhabitants is directed chiefly to husbandry, the coast fisheries, and domestic manufactures. There are manufactories of woollen goods, fire-arms, and earthenware. Commerce is active, and is much facili-

tated by the long floods. The principal commercial emporium is Aarhus. The construction of the Jutland railway was conceded to Sir Morton Peto by an act of the legislature, March 4, 1857, which was ratified by the king of Denmark in 1859. It is to connect Aarhus with Holstebro *via* Viborg, with a branch to Randers.

JUVENAL (JUVENALIS), DECIMUS JUNIUS, a Roman satirical poet, flourished in the latter part of the 1st century A. D. and in the 1st quarter of the 2d. The only certain facts in his personal history are that Aquinum was either the place of his nativity or his chosen residence, and that he was an intimate friend of the poet Martial, who addresses him in three of his epigrams. According to the oldest memoir of him, which is ascribed with little probability to Suetonius, he was either the son or the *alumnus* of a wealthy freedman, occupied himself till middle age as a pleader, was led to devote himself to satirical composition by the success of some verses which he wrote upon a pantomimist named Paris, after much hesitation recited his satires before numerous audiences, which were received with so much favor that he ventured to insert in one of them his attack on Paris, which was construed into an attack on an actor at that time in high favor at court, and was therefore, though 80 years of age, appointed to command a cohort of infantry in Egypt, and died after a short time of vexation and grief in this honorable exile. The pantomimist Paris, a favorite of Domitian, was put to death in A. D. 83; and as it is established that one of the satires of Juvenal was written not earlier than 96 and another not earlier than 100, he could not have been sent to Egypt in the lifetime of Paris, unless he afterward returned, in which case it is strange that his works contain no allusion to his exile. The story of his banishment is therefore questioned by some critics. Juvenal disputes with Horace the honor of being the greatest Roman satirist. Living amid the vices of a declining state, under the

tyranny of Nero and Domitian, and seeing the humiliation of his countrymen, his compositions are much more purposely and formally severe than the easy and good-humored satires of Horace. Each of them is an elaborate and sonorous piece of declamation, which confirms the statement of some of his biographers that in youth he diligently attended the schools of the rhetoricians, and that he was accustomed to declaim at the forum during many years of his life. His extant works are 15 satires, and a fragment of doubtful authenticity, all in heroic hexameters. There are numerous very early editions, 6 of which may claim to be the *princeps*. Among the most complete editions are those of Ruperti (Leipsic, 1819) and Heinrich (Bonn, 1839). The English translators are Holyday, Stapylton, Dryden (of 5 satires), Gifford, Hodgson, Badham, and Evans.

JUXON, WILLIAM, an English prelate, archbishop of Canterbury, born in Chichester in 1582, died June 4, 1663. He was educated on the foundation of the merchant tailors' school, and of St. John's college, Oxford, of which he became a fellow in 1598. Originally destined for the law, he studied theology, and became vicar of St. Giles's, Oxford, in 1609, and rector of Somerton in 1614. He was president of his college in 1621, and vice-chancellor in 1626 and 1627. He became successively dean of Worcester and prebendary of Chichester, bishop of Hereford, and in the same year, 1633, bishop of London. In 1635 he was appointed lord high treasurer, but earnestly solicited leave to resign the office in 1640, and returned to the charge of his diocese. He was a prelate of great learning and piety, and was devotedly attached to the king, whom he attended in the isle of Wight, at his trial, and to the last upon the scaffold. After the king's execution, he was deprived of his bishopric, and imprisoned for a short time for refusing to disclose his last conversation with the king. After the restoration he was made archbishop of Canterbury in 1660.

## K

**K**, the 11th letter of the Phœnician and other Semitic graphic systems, named *kaph* (hollow of the hand, curved), is also the 11th of many European alphabets, although the letters preceding it do not exactly coincide in both systems. It is the 10th (*kappa*) in Greek. In ancient Latin, as long as O was used as the sign of G, it was the 9th; but after the innovation of O for the hard guttural in all positions, and the introduction of G as its corresponding soft guttural, it became the 10th letter, though merely in a few abbreviations, such as K. for *Cæso*, *kal.* for *calenda*, &c. It is erroneously said to be the 11th in most modern Latin grammars. (See G, and J.) Sallust, a grammarian of Rome, attributes its introduction into the Latin to

one Salvius. Quintilian denies it a place in the Latin, and blames its use even before *a*, as in *kalenda*, *kalumnia*, although it was burnt in upon the forehead of slanderers. According to Scaurus, K was anciently used instead of the syllable *ca*, O instead of *ce*, *ci*; and according to Velius Longus, Q instead of *qu* or *cu*; and it is owing to this ancient usage that in our modern alphabets K is pronounced *kæ*; Q, *ce* and *ci*, as if they were *ci* in French, *se* in English, *tehi* in Italian; and Q as *ku*. In hieroglyphs K was represented by the quadrant of a circle and by a flat basket with a handle. It is the 11th letter in Cufic, the 22d in Arabic, the 25th in Persian and Turkish, the 14th in Ethiopian, the 17th in Amharic; the 15th in Armenian, 11th

in Georgian, 14th in Cyrillic, 18th in Glagolitic, and 11th in Russian (*kako*). It was represented by *qu* in ancient French, in all positions, though in modern French only in *que* and *qui*; while in the same language the K is maintained only in *kyrielle*, in some Greek words, such as *ky-nariois*, *hyste*, which are now more frequently written with *c*, in other foreign words, such as *kali*, *kino*, *knout*, and in proper nouns. Charlemagne's coins have most frequently *Carolus M.*; but the 6 Charleses who reigned after him in France used K in their names.—The sound of K is produced like that of G, with this difference, that the larynx does not oscillate during the sudden explosion of the sound. The congeneric sounds may be seen under G.—Some proper nouns are written either with K or O; as, for instance, in German, Cammer, Carl, Colln, or Kammer, &c.; or in French, Coran, Colocotroni, or Koran, &c. But the substitution of K for Kh in such names as Khalif, Khan, Kherson, Khiva, &c., which are also written Ohan, Oherson, &c., is due to the want of letters which represent a deeply aspirated K, almost like the German *ch*, or Greek *χ*, and the 7th Arabic (9th Persian and Turkish) letter *kha*. The Devanagari *akshara kaarya* (consonants guttural) contains *ka* and *kha*, *ga*, *gha*, where, however, the *h* is distinctly pronounced in the 2d and 4th, as in the English words *inkhorn*, *stronghold*. The English habit of not pronouncing both *k* and *g* in *kn*, *gn* (as in *know*, *gnaw*), destroys the significant element of the words, depriving them of the roots *ken*, *cut*, &c. This improper practice was carried even further in Latin, where the *g* was not even written in most words which begin with *n*, such as *natura*, *nosco*, *notus*, originally *genitura*, *γενεσκος*, *gnocus*. In German, *ek* is written for *kk* (in Polish it is pronounced *tk*, as in Potocki), and the initial *k* before consonants is frequently the hardened particle *ge* deprived of *e*, as in the words *Knecht*, servant, from *ge-neigt*, bent, subject to; and *klug*, prudent, from *ge-lug*, looking out. K alternates in the Semitic languages with *g*, *i*, *q*, *h*, *kh*, *ghain*; and in the Indo-European as well as most others with those letters, and with *c*, *j*, *y*, *w*. One example may suffice, wherein the root *kr*, as *car-us* and *cur-a* in Latin, runs through the following forms, conveying in all the radical idea contained in these Latin words: *kort-us*, *gard-en*, Ital. *giard-ino*, French and Spanish *jard-in*, Magyar *kort*, Slavic *ogrod*, *za-hrad-a*; with the kindred words *yard*, *ward*, *guard*, &c., to which several hundreds of similar radical import might easily be added.—As a numeral sign, K denotes 20 in the Semitic, Greek, Georgian, and Cyrillic (and hence in the Russian) systems; 40 in the Glagolitic; 60 in the Armenian; 250 (along with E) in the period of Rome's decline. A dash over it raises these values to as many thousands. In rubrication it marks 10. On Roman coins and other monuments it stands for *Kaisar*, *Karthago*, *Kaput*, and many other words beginning with *Ca* in the later Latin; K. S., *carus suis*, &c. On

French coins it designates Bordeaux; on those of Austria K. B. signify Kőrmöcz-Bánya or Kremnitz mine.

KABYLES. See ALGERIA.

KACHIQUEL; or CACHIQUEL, one of the principal aboriginal families of Central America, and with the Quichés and Zutugils constituting what were called the three metropolitan nations of Guatemala. They occupied the region surrounding the great volcanoes of Agua and Fuego, and the ancient city of Guatemala was founded not far from their capital, to the southward of the Zutugils, or, as they were called by the Mexicans, the Atitlanenses. After the conquest of the affiliated nations of the Quichés and Zutugils, the Kachiquel kings sent presents to Alvarado, and submitted without a contest to the Spanish authority. They afterward gave him a large body of auxiliaries for his expedition against the Pipils of Cuscatlan or San Salvador. Their language was a principal dialect of the Tzendal, with which the Maya of Yucatan and all the languages of Guatemala were more or less intimately related. It is still spoken. Father Ildefonso Joseph Flores published a grammar of this language entitled *Arte de la lengua metropolitana del reyno Cakchiquel ó Guatemala* (Guatemala, 1758). A dictionary of the language, entitled *Compendio de nombres en lengua Kachiquel*, by Fray Panteleon de Guzman (1701), exists in MS. in possession of Mr. E. G. Squier of New York. There is another, date and author unknown, in the imperial library of Paris.

KAFFA, or KAWA, a country of E. Africa, lying S. of Abyssinia, and bounded W. by unexplored regions. It consists of an extensive table-land, between two branches of the river Gojeb, at an elevation of about 5,000 feet above the sea. The country is under the sway of an absolute king, or *tala*, who it is said can raise 10,000 horsemen, and who is frequently at war with his neighbors. The inhabitants are of an Abyssinian type, and profess to be Christians; their language belongs to the Hamitic group of tongues. They cultivate the soil, which is fertile in palma, cotton, and coffee. Trade is carried on with the merchants of Enares, who exchange rock salt, copper, horses, cattle, and silks for coffee, cotton, and slaves. Coffee is indigenous, as is a species of tea plant called *khat*. M. d'Abbadie, a French traveller, in 1848, was the first European who penetrated into the country. The chief town is Bonga, lat. 7° 12' 30" N., long. 36° 4' E.; it contains 6,000 to 7,000 inhabitants.

KAFFA, CAFFA, or FREODOSIA (Theodosia), a Russian seaport of the Crimea, built under the shelter of a cape at the W. angle of a wide, open bay of the Black sea, lat. 45° 1' 37" N., long. 35° 23' 37" E.; pop. about 8,000, exclusive of the garrison. The inhabitants, consisting of Russians, Tartars, Greeks, Armenians, Germans, and Jews, are mostly engaged in fishing and the manufacture of salt. Caviare is made there. Wool and hides are exported. This place is the proposed terminus of the railroad from St.

Petersburg. It is the seat of a Greek archbishop, and has, beside Greek churches, a Roman Catholic church, 2 synagogues, 2 mosques, a public library, museum, botanic garden, theatre, custom house, and quarantine buildings. It is near the site of the ancient Theodosia, which was founded by the Milesians, and was one of the towns of the ancient kingdom of Bosphorus. The Genoese established a colony here in the 13th century A. D. In the latter half of the 15th century it was taken from them by the Turks, from whom it was captured by the Russians in 1770.

**KAIRWAN**, **KAIRVAN**, or **EL KIRWAN**, the 2d city of Tunis, 80 m. S. S. E. from the city of Tunis, and 27 m. S. W. from Soosa, built on a sandy plain, in lat.  $35^{\circ} 37' N.$ , long.  $10^{\circ} 15' E.$ ; pop. estimated at 50,000. The city is surrounded by a low wall with 4 gates. It is the entrepot of a large general commerce, and its manufactures of yellow morocco boots and slippers are celebrated. The great mosque of Kairwan is a large and magnificent edifice; its roof is said to be supported by 500 columns of granite. The city was founded by the Arabs about A. D. 670, and was from 802 to 970 the capital of their independent African dominions.

**KAISAREEYEH**, or **KAISARIAH**, a commercial city, capital of a district of the same name, in the Turkish province of Anatolia, 150 m. E. N. E. from Konieh, situated in a recess of the Arjish mountain, at an elevation of 3,286 feet above the sea, in lat.  $38^{\circ} 41' N.$ , long.  $35^{\circ} 45' E.$ ; pop. about 80,000. An extensive plain, watered by the river Karasu, and fertile in cotton, fruits, and wine, stretches N. from the hills. The town is mean and dirty, but is the emporium of an extensive export trade. The chief industry is the manufacture of cotton yarn, cloth, and yellow morocco leather. This place, anciently called Mazaca, was the capital of Cappadocia until that country was formed into a Roman province, when the name of the city was changed to Cæsarea (whence its modern name), under which latter appellation it gave title to a Christian bishop from the early times of the church. St. Basil the Great was born and is buried here.

**KAKODYLE**, or **CACODYLE** ( $2O, H, As = O, H, As$ ), a coupled compound of arsenic and methyle, expressed by the name arseniodimethyle. The substance is a highly poisonous liquid, heavier than water, gives forth vapors of specific gravity 7.1, which have a most disgusting odor, and takes fire spontaneously on exposure to the air. It boils at  $338^{\circ}$ , and solidifies in square prisms at  $21^{\circ}$ ; it is soluble in alcohol or ether, but scarcely so in water. It unites as a base directly with oxygen, and probably with sulphur and chlorine also; and it furnished the first instance of the isolation of an organic metallic basyle. It is obtained by decomposing its chloride by granulated zinc, or its sulphuret by means of mercury. The preparation of the compounds of kakodyle is difficult and dangerous. The oxide obtained by distilling

equal parts of dried acetate of potash and arsenious acid is an impure quality of the foetid liquid formerly known as Cadet's fuming liquor or alkarsine, which inflames spontaneously on exposure to the air.

**KALAFAT**, a walled town of Turkey in Europe, in Little Wallachia, on the left bank of the Danube opposite Widin, 370 m. N. W. from Constantinople. It contains 2,000 houses, 3 mosques, a town hall, a custom house, a quarantine, and cavalry barracks. The town is built on a plain of the same name, skirted by hills. Its fortifications describe an arc of a circle around the town, the Danube forming the chord. Kalafat is a quarantine station. It is important in a strategetic point of view, and has figured more than once in Turkish military annals. Here the Russians, in 1829, lost 10,000 men in their operations against the Turks. A communication with Widin was established in Oct. 1853, by means of a floating bridge, for the purpose of forming a communication between the left wing of the Turkish army under Omer Pasha garrisoned in Widin, and the fortified works thrown up around Kalafat as a defence against the Russians. An engagement took place there, Jan. 6, 1854, and an assault of the Russians was gallantly repulsed by the Turks on April 19.

**KALAMATA**, capital of the Grecian province of Messenia, about 1 m. from the gulf of Koron in the S. of the Peloponnesus; pop. about 6,000. It is supposed to be built on the site of Phara, one of the maritime cities in the time of the Trojan war. During the crusades it was one of the most important places of the Peloponnesus. It was subsequently annexed to the possessions of Venice. It passed into the hands of the Turks at the beginning of the 18th century. It was among the first towns delivered by the Greeks in 1821, and the first where a Grecian legislative assembly was convened. In 1825 it suffered from the attack of the Egyptians under Ibrahim Pasha, but the damage then inflicted upon the town has been gradually repaired.

**KALAMAZOO**. I. A S. W. co. of the S. peninsula of Mich., drained by Kalamazoo and St. Joseph's rivers; area, 576 sq. m.; pop. in 1850, 13,179. The surface is level or undulating, and occupied by rich prairies, fertile plains dotted with oak timber, and thick forests. The productions in 1850 were 366,578 bushels of Indian corn, 225,855 of wheat, 97,325 of oats, 106,913 of potatoes, 11,736 tons of hay, and 94,750 lbs. of wool. There were 10 grist mills, 13 saw mills, 15 churches, 2 newspaper offices, and 4,184 pupils attending public schools. Capital, Kalamazoo. II. A river of Michigan, which rises in Hillsdale co. in the S. part of the state, and after a circuitous course of nearly 200 m. flows into Lake Michigan, 98 m. in a direct line from its source. Its general direction is W. N. W. It is 300 or 400 feet wide at its mouth, and navigable at all seasons by vessels of 50 tons to Allegan, 38 m. from the lake. It drains a rich level country, affording extensive water power.

III. A city of Michigan and the capital of Kalamazoo co., situated on the left or W. bank of the river of the same name, about 65 m. from its mouth, 50 m. S. from Grand Rapids, and 143 m. W. from Detroit by the Michigan central railroad, which connects it with that city and Chicago; pop. in 1850, 3,284; in 1859, about 8,000. It is pleasantly situated, in the midst of a beautiful and fertile country, and is regularly built with broad streets shaded by fine oak trees. It is the seat of Kalamazoo college, for students of both sexes, the Michigan female seminary, the Michigan asylum for the insane, a union school, and various other institutions. It has two weekly newspapers, and in 1859 contained 10 churches (2 Baptist, 2 Congregational, 1 Dutch Reformed, 1 Episcopal, 2 Methodist, 1 Presbyterian, and 1 Roman Catholic), 1 flour mill, 1 iron foundry, 1 machine shop, 3 manufactories of agricultural implements, 1 of pianofortes, 1 of soap and candles, 1 tannery, and 8 planing mills.

KALARASH, a small town in the Turkish province of Wallachia, on the left branch of the Danube, opposite Silistria, with trade in grain and produce. It is noted for several military engagements which took place there during the war of 1854, particularly on March 4, when the Russians, who were intrenched in the place, repulsed the Turkish forces.

KALB, JOHN, BARON DE. See DE KALB.

KALEIDOSCOPE (Gr. *καλός*, beautiful, *εἶδος*, a form, and *σκοπεῖν*, to see), an optical instrument for multiplying the reflected images of small colored objects, producing by the symmetry of their arrangement patterns of great beauty, which have served to furnish designs for carpets and other ornamental fabrics. An instrument on this principle was originally described by Baptista Porta and Kircher; and in a work by R. Bradley published in England in 1717, entitled "New Improvement of Planting and Gardening," it was recommended for aiding in the production of designs for garden plots and fortifications. Its true principles were first developed, however, by Sir David Brewster, who devised the proper method of its construction, and in 1817 took out a patent for the same. But before he could secure the benefit of the patent, the London opticians had produced some 200,000 instruments, which they distributed everywhere as toys. Nearly all these were exceedingly defective from the total disregard in their construction of the exact principles upon which the perfection of the instrument depends.—When two oblong mirrors of the same dimensions are placed so as to hinge together along an edge of each, their reflecting surfaces facing each other, and are then opened, so as to make an angle which is an aliquot part of 180°, an object placed between the planes of the mirrors, or in contact with one of the extremities of the pair, is reflected from one mirror to the other, and produces as many images as the angle of the opening is contained in 360°. These images are arranged in symmetrical or-

der around a circular area, the radius of which is the width of the mirror, and the centre the point of meeting of the two planes. The perfect symmetry of their arrangement depends on the angle of the opening being an aliquot part of two right angles, and that usually employed is either 18° or 20°. Another requisite for the perfection of the instrument is, that the line of junction of the two mirrors should be fine and smooth, as any irregularities would produce imperfections. As usually constructed, the mirrors are strips of glass blackened on one side with black varnish or sealing wax, 8 or 10 inches long, 1 to 1½ inches broad at one end, and only about half as wide at the other. They are kept together by a piece of cloth glued over the edges in contact, and the proper angle is preserved by securing them in a tube of tin or pasteboard by pieces of cork of suitable shape wedged in behind them. The open side of the triangular prism formed by the two mirrors is closed by a strip of black velvet of suitable width glued to the backs of the two mirrors. The cylindrical tube is of the diameter of the larger end of the prism, and the angle formed by the meeting of the two planes at the other extremity is nearly coincident with the centre of the circular end of the tube. Through the cover of this a small aperture is made exactly in the angle, to which the eye is to be applied in using the instrument. At the other extremity a plain disk of thin transparent glass is fitted close to the ends of the mirrors, and outside of this is another disk of the same size of glass slightly ground, the two kept  $\frac{1}{4}$  or  $\frac{1}{8}$  of an inch apart by a ring of this thickness set in between them. In the intervening space the objects to be reflected are placed. These may be small fragments of colored transparent glass intermixed with a variety of other small bright objects of diverse forms, as beads and spun wire of glass and of metal, bits of lace, figures and letters, circles, ovals, and triangles, pieces of indurated Canada balsam, varnish, &c. But care must be taken not to fill the case too full for the objects to move freely among themselves while the tube is made to turn in the hand upon its axis. By looking into the circular aperture made for the eye, the most gorgeous figures are perceived symmetrically arranged, and all forming one complete pattern.—Kaleidoscopes are also made with 3, 4, 5, or more mirrors, and are then termed polycentral. To produce symmetry and regularity of form in the images of these kaleidoscopes, the angles which the mirrors make with each other must necessarily be aliquot parts of 180°; and as their number is increased, the range of the instrument in the variation of these angles is diminished. Thus 3 mirrors only should be arranged to make the 3 angles of 60° each, or two of 45° each and one of 90°, or one of 30°, one of 60°, and one of 90°. By the first arrangement the images appear in groups of 3 repeated throughout the pattern. This instrument is called the triascope. By the 2d arrangement, the instrument, called the tet-

roscope, produces a pattern divided into square compartments. By the 3d arrangement, the pattern, of hexagonal form, presents a remarkable symmetry, and the instrument is termed a hexascope. The last two forms are especially useful to the draughtsman.—Sir David Brewster substituted a double convex lens for the two glass disks in order to adapt the instrument for receiving and multiplying the images of external objects. He also introduced a variety of modified forms and methods of using it, an account of which may be found in his "Treatise on the Kaleidoscope," and in his later "Treatise on Optics." See also "Harris's "Treatise on Optics;" Dr. Roget "On the Kaleidoscope;" "Annals of Philosophy," vol. xi.; *Compte rendu des travaux de l'académie de Dijon* (1818).

KALEVALA, the national epic of Finland. See FINLAND.

KALIDASA, one of the greatest Indian poets, lived, according to tradition, at the court of King Vitramaditja, in the 1st century B. C. He was one of 9 poets who were called the 9 precious stones of the court. Vitramaditja (sun of strength) is a title given to several Indian monarchs, and many scholars believe Kalidasa to have flourished in the 11th century A. D. at the court of King Bhoja. The works attributed to him are so various that the existence of several poets of his name at different periods has been supposed. His best production is the drama *Sakuntala*, which was translated into English by Sir William Jones in 1789, and immediately excited in Europe a lively interest in Sanscrit literature. It was translated into German by Forster (1790) and Herder (1808), and into French by Chézy (published with the Sanscrit original, 1830). He is the author also of the drama *Vikramorvasi* (translated into English by H. H. Wilson; published with a Latin translation by Lentz, Berlin, 1833); the comedy "Malavika and Agnimitra" (published with a Latin translation by Fallberg, Bonn, 1840); the epical poem *Baghu-Vansa* (published in Sanscrit and Latin by Stenzler, London, 1832); the *Kamara-Sambhava* (also edited by Stenzler, London, 1838); the *Megha-Duta*, or "Cloud Messenger" (translated into English verse by H. H. Wilson, Calcutta, 1818, and London, 1848); and several other dramatic and lyrical pieces.

KALISZ (Germ. *Kalisch*, anc. *Calisia*), one of the oldest towns of Russian Poland, formerly the capital of a palatinate and subsequently of a government of its name, now of a circle in the government of Warsaw, situated between two branches of the Prosna, on the Prussian frontier; pop. about 15,000, one fifth of whom are Jews. It is the see of a Roman Catholic bishop, was conspicuous during the wars of the Polish and Silesian princes in the middle ages, and was taken in 1656 by the Swedes. The Russians gained a victory here over Charles XII. in 1706, and over the French in Feb. 1813. A few days after the latter event an alliance was formed here between the czar Alexander and the king of Prussia, Frederic William III.

KALKBRENNER, CHRISTIAN, a German composer, of Jewish extraction, born in Minden, Sept. 22, 1755, died in Paris, Aug. 10, 1806. He was a number of years in the service of Prince Henry of Prussia, the brother of Frederic the Great, as composer; and subsequently he officiated as singing master in the academy of music in Paris. He is the author of a number of operas and pianoforte pieces, and of a history of music, not completed at his death, which is considered valuable authority on whatever relates to Hebrew and Greek music.—FRIEDRICH, son of the preceding, born in Cassel in 1788, died in Eugbien-les-Bains, near Paris, June 10, 1849. His musical education commenced at an early age, and was completed in Paris, where in 1802 he gained two prizes at the *conservatoire*. As a pianoforte performer he was one of the most eminent of his time, and his compositions for that instrument are still in great estimation. During several years he resided in England as a teacher, but in 1823 fixed himself permanently in Paris. Among his published works are many pieces of chamber music for a variety of instruments. He also arranged the symphonies of Beethoven for the pianoforte.

KALM, PETER, a Swedish botanist, born in Osterbotten in 1715, died in Abo, Nov. 16, 1779. He was educated at Upsal, and on the suggestion of Linnæus he was selected in 1745 by the Swedish government to make a botanical tour of North America. He arrived in Philadelphia in the summer of 1748, and remained in America till 1751, travelling and gathering specimens of plants in Canada, New York, and Pennsylvania. On returning to Sweden he published *En resa til Norra Amerika* (3 vols., Stockholm, 1758-'61), translated into English by John Reinholdt Forster under the title of "Travels in North America" (2d ed., 2 vols., London, 1772); it was also translated into German and Dutch. He was made professor of natural history at Abo. The beautiful evergreen shrub *Kalmia* is named after him.

KALMIA, a genus of flowering shrubs peculiarly North American, and belonging to the natural order of *ericaceæ*. They are all handsome evergreen-leaved shrubs, of which the mountain laurel (*K. latifolia*) is a familiar and conspicuous instance. This fine shrub, almost a tree, in favorable situations attaining to from 15 to 20 feet, may be found upon rocky hills and in damp soils, from Maine to Ohio and Kentucky. Its foliage is of a bright green color, the leaves being mostly alternate, ovate-lanceolate, or elliptical and petioled. Its flowers are borne in terminal corymbs of considerable size, and made up of rose-colored or white blossoms so clammy-pubescent as to adhere to each other when incautiously plucked. The mingled deep green and rosy colors of this bush have gained it the trivial name of calico bush. The wood of the mountain laurel is very smooth, close-grained, and hard; that of the root is marked with red lines; it is well adapted to the turner's use for

making small ornamental articles. As a fine shrub for the garden, this species is much prized; and it readily adapts itself to artificial culture. The plants should be removed when about expanding their flowers, and if this is done with care, and they are shaded and protected for the remainder of the season, they will soon establish themselves in a spot properly prepared for their future growth. The flower buds are formed at the end of the summer before they expand, and branches bearing them, if broken off and kept deeply plunged in fresh and pure water in some warm room, will blossom toward the end of winter. There is a species known as the sheep laurel (*K. angustifolia*, Linn.), having leaves in threes, which are of a light green color above and paler or whitish underneath; the flowers appear in lateral corymbs owing to the new growth of the young terminal shoots; these flowers are small, but of a deep crimson tint and very beautiful. The shrub is only 2 or 3 feet high. This species ranges from Hudson's bay to Georgia. Its leaves are generally considered injurious to lambs, a quality attributed to the mountain laurel also; but perhaps in both instances it is owing more to the indigestible quality of such food than to any really harmful property. The pale laurel (*K. glauca*, Aiton) is a small and straggling shrub about one foot high, having 2-edged twigs and opposite leaves, which are of a bright color above and of a beautiful glaucous white beneath, with the margins revolute. The flowers, each half an inch in breadth, are borne in terminal corymbs upon thread-like footstalks, the corolla being of a pale rosy color with brown anthers, and expanding in July. This beautiful species grows in cold, boggy swamps, ranging from the arctic circle through Canada to Pennsylvania. A species a foot high, with terete branches, oblong leaves, and rose-colored corols, blossoming from May to September, is known as the hirsute laurel (*K. hirsuta*, Walter), and is to be met with in sandy pine-barren swamps in eastern Virginia and southward. Elliott, in his "Sketch of the Botany of Georgia and South Carolina," describes this as a small shrub, branching, very hairy, with handsome but solitary flowers, so that the species is not so ornamental as its congeners. The kalmias are regarded by florists as shrubs of easy culture in peaty soils, and can be propagated by layers, seeds, or cuttings. The leaves of *K. latifolia* and other species are beneficially employed, either in decoction or powdered, in scabies, porrigo, and other diseases of the skin.

KALMIA, a small scattered village, or settlement, in Edgefield district, S. C., locally famous for its production of fine fruits, peaches, grapes, &c.; the whole neighborhood being remarkable for the excellence of its fruits, the degree in which the grape has been cultivated to perfection, and the increasing quantities of good wine which are annually produced. The scenery is undulating and attractive; the climate singularly salubrious, and especially commended to consumptives. It is a favorite retreat for many of

the wealthy citizens of Charleston. Graniteville, known as one of the largest and most prosperous of the cotton manufacturing establishments of the South, lies within this precinct, and constitutes itself, a village of much prosperity and beauty.

KALOOGA, or KALUGA, a government of European Russia, between lat. 53° 20' and 55° 20' N., long. 38° 20' and 37° E., bounded W. and N. W. by Smolensk, N. and N. E. by Moscow, E. by Tula, and S. by Orel; area about 12,178 sq. m.; pop. in 1856, 1,006,671. The surface is in general very level. It is watered by numerous rivers, the principal of which is the Oka. The soil is of a sandy or strong clayey nature, and only moderately fertile. More than half of this province is under forest. The climate is one of the mildest in Russia. Iron, coal, chalk, and gypsum are found. Woollens, linens, sail cloth, &c., are manufactured.—KALOOGA, the capital of this government, stands on the left bank of the Oka, 95 m. S. W. from Moscow; pop. 31,000. It is irregularly built, being 7 m. in circumference, though not containing more than 4,000 houses, chiefly of wood. It is surrounded by a rampart which has been converted into a public promenade. It contains 33 churches, a theological college, nunnery, hospital, gymnasium, government house, orphan asylum, public library, and theatre. It is a place of considerable trade, and the chief seat of the manufactures of the province. A commercial bank was founded there by a public-spirited citizen in 1859, the profits to be applied to charitable purposes. Political offenders of high rank have been banished to Kalooga for many years past. Schamyl, the Caucasian chieftain, was removed there in 1859.

KAMA, a river of Russia, the principal affluent of the Volga, rises in a branch of the Ural mountains in the N. part of the government of Viatka, runs first N. and N. E., then takes a S. W. direction through the governments of Perm and Kasan, forming immediately the boundary between Viatka and Orenburg, and joins the Volga, after a course of over 1,000 m., 40 m. from the city of Kasan, almost doubling the volume of the Volga. It receives in its course the tributary rivers Viahra, Tchussovaya, Bielaya, and Ik, on the left, and the Obva and Viatka on the right. The Kama is navigated by barges to Perm, and by flat boats much higher. Its waters at Perm have a depth of 23 feet less at the end of summer than in the freshets of spring. It is connected with the Dwina by a canal 12 m. long, thus establishing water communication between the Caspian and White seas.—KAMA is also the name of a district of British Caffraria, which in 1858 contained a population of 2,850 natives, and of 68 Europeans, exclusive of the English garrison.

KAMEHAMEHA (or TAMEHAMEHA) I., the first king of the Sandwich islands, born in the middle of the 18th, died in the beginning of the 19th century. Toward the end of the 18th century each of the different islands was gov-

erned by a sovereign and by several other chiefs. Kamehameha was one of the latter, and succeeded by his superior energy and ability in subduing all the islands excepting Atauai and Nihau, which however gave their allegiance to his successor. As Europeans had aided him in his conquest, he favored their settlement in the islands, and placed his kingdom under the protection of England. He was succeeded by his son KAMEHAMEHA II., who abolished idolatry and introduced Christianity (1819). He visited England with his wife, where both died in 1824. His brother, KAMEHAMEHA III., born in 1817, succeeded him. During his reign the Roman Catholic missionaries were banished in 1837. The French admiral Du Petit-Thouars protested against this measure on behalf of his government, and his interference led the king to a formal declaration of the independence of the Sandwich islands (1840). In 1842 Du Petit-Thouars renewed his interposition in favor of the Roman Catholic missionaries. In order to protect himself against his attacks, the king appealed to the English government, which maintained a body of troops in the islands from Feb. 25 to July 8, 1843. In 1844 the independence of the country was officially recognized by the governments of Great Britain and the United States. A treaty, however, concluded with England in 1846, gave to that power a preponderating influence in the islands. New and serious complications with France arose in 1849, when the French consul Dillon insisted upon equal privileges for missionaries of all persuasions, upon a reduction of the tariff, and upon the adoption of the French as the official language. The refusal of the king to comply with these demands led to hostile demonstrations on the part of the French, which were only interrupted by the protest of the representatives of the United States and Great Britain. An attempt to renew hostilities was made by France in 1851, which induced the king to strengthen his alliance with the United States. Chiefly under the advice of American missionaries and other American residents, he adopted (Dec. 6, 1852) a constitutional form of government, with a house of nobles composed of 27 and a lower house of 25 members, respectively including 3 and 8 foreigners. The project of annexing the Sandwich islands to the United States, formed during his reign, was abandoned after his death (Oct. 15, 1854), when he was succeeded by his son, KAMEHAMEHA IV. (Alexander Liholiho), the present king, who was born Feb. 9, 1834. This prince received an excellent education from Protestant missionaries, and improved his knowledge by travelling in Europe. In 1856 he married Emma Rooker, daughter of an English physician, who gave birth to a son, May 20, 1858. A great sensation was produced in the islands in 1859 by the king's attempting, in a fit of jealousy against his wife, to murder his secretary. He proposed to abdicate, but was persuaded to resume his duties.

KAMES, LORD. See HOME, HENRY.

KAMIENIEC, KAMIENIETZ, or KAMENETZ-PODOLSKOI, a town of Russia, capital of the government of Podolia, 12 m. N. from the Dniester, on the left bank of its affluent the Smotritza, 285 m. N. W. from Odessa; pop. in 1856, 18,800, of whom half are Jews. It is the seat of a Greek eparchy, and a Roman Catholic see. The principal buildings are the cathedral of Peter and Paul and 4 other Greek churches, several convents, one Armenian and 8 Roman Catholic churches, a Greek theological seminary, a gymnasium, 2 public schools, and a government library. The town has some manufactures and a considerable trade, especially in peltries with Moldavia. Its fortifications were razed in 1812; it has still a citadel and a detached fort. This place was the strongest bulwark of the Poles toward their Turkish frontier. The Turks took it in 1672, and held it till the peace of Carlovitz in 1699.

KAMOURASKA, an E. co. of Canada East, bounded S. E. by the state of Maine and N. W. by the river St. Lawrence; area, 1,090 sq. m.; pop. in 1851, 20,896. It is drained by Du Loup, Kamouraska, and Ouelo rivers, and other small tributaries of the St. Lawrence, and by some affluents of the St. John. The surface is diversified, and in the S. mountainous. The soil is fertile. Wheat, rye, barley, oats, and potatoes are the principal productions. Capital, Kamouraska.

KAMPEN, NIKOLAAS GODFRIED VAN, a Dutch historian, born in Haarlem, May 15, 1776, died March 14, 1839. As a youth he acquired in a book store, where he was employed, a knowledge of literature, and mastered several languages. He then became teacher of German, editor of the "Leyden Gazette," and finally professor of the Dutch language, literature, and history, first at the university and then at the atheneum in Leyden. He was the author of numerous works, many of which, translated into German, have a European reputation.

KÄMPFER, ENGELBRECHT, a German traveller, born in Lemgo, Lippe-Detmold, Sept. 16, 1651, died in Detmold, Nov. 2, 1716. He completed his education at the university of Königsberg, and then going to Sweden was appointed secretary to an embassy which was proceeding from that country to Persia. In 1685 he entered as surgeon the naval service of the Dutch East India company, and sailed for Batavia, whence in 1690 he was despatched to Japan in the capacity of physician to the embassy which that company annually sent thither. He remained in Japan two years, and gathered materials for his great work on the history, resources, &c., of that empire. In 1693 he returned to Europe. He was the author of various valuable works, but published nothing himself, save his *Amanitates Exotice* (1712), which contains much curious matter touching the natural history, antiquities, &c., of Persia and other countries of western Asia. His account of the Japanese empire has never been published in the original, but an English translation of it, under the title of "History of Japan and Description of Siam," appeared

in London in 1727, and from this the French and German versions have been taken.

**KAMTOCHATKA**, a large peninsula of the Russian empire, on the N. E. of Asia, 850 m. long from N. to S., and of irregular breadth, the maximum, along the 56th parallel of latitude, being about 250 m.; area, 80,000 sq. m.; pop. in 1856, 19,101. It is bounded N. by the country of the Tchouktchees, E. by the sea of Kamtochatka, S. by a strait separating it from the Koorile islands, and W. by the sea of Okhotsk. Since 1856 it has been united with the Trans-Jablonic district and the recently acquired Amoor territory to form the maritime province of Eastern Siberia. The coasts are dangerous of approach on account of outlying reefs. A lofty range of volcanic mountains traverses the country in a S. W. direction, with many peaks between 7,000 and 16,000 feet high. The snow line, in lat. 56° 40', is at an elevation of 5,260 feet. This range is a portion of the great volcanic chain extending from the Jablonoi mountain range to the Koorile islands. Dittmar, a Russian traveller, has devoted 3 years (1851-'53) to the exploration of the geology of Kamtochatka. He traced 5 successive formations, and found 17 volcanoes still in active operation. Numerous rivers have their rise in the heights. The Kamtochatka, with its affluent the Yelovka, is navigable for 150 m. The most fertile portion of the peninsula for agricultural purposes lies along the valley of this river. The Russian settlers here raise oats, barley, rye, potatoes, and garden vegetables, but the rest of the country is little adapted for culture. The climate is very severe; the winter lasts 9 months, and frost is common at all seasons. The mean annual temperature at Petropavlovsk on the E. coast is 28.5°, while at Tigil on the W. it is 48°. The average temperature of summer at the former place is 55.5°, and that of winter 19°, but the thermometer has been known to fall as low as -25°. Earthquakes are frequent and violent. Animal life is very abundant, and until recently the inhabitants supported themselves wholly on the products of the chase; but since the game has diminished, they find plenty of aliment in fish, which swarm in the seas and rivers. The wild animals, yet abundant in the more sequestered localities, are bears, wolves, reindeer, argalis or wild sheep, black, red, and gray foxes, ermines, sables, and otters. Wild fowl are very numerous. The principal varieties of fish are herrings, cod, and salmon. Whales are numerous in the adjacent seas. The mountains are covered with forests of birch, larch, pine, and cedar, of considerable size in the south, but diminishing northward until the northernmost portion of the territory is covered only with reindeer moss.—The Kamtchatdales, the principal native tribe, are of diminutive stature, but stout, with flat features, small eyes, thin lips, lank black hair, and scarcely any beard. They are described as a peaceable, honest, lazy, and intemperate race. In winter they reside in a sunken hut, in summer in one elevated on poles

some 18 feet from the ground. Their dress is equally adapted to the changes of temperature, being of fur in winter and nankeen in summer. They are nominally governed by their own *toions* or chiefs, under the jurisdiction of the Russian *ispravnik*, or chief judge. Dog trains are used as the means of transport. The other principal tribe are the Koriakes, who live north of lat. 58°. While the Kamtchatdales are hunters and fishermen, with fixed habitations, the Koriakes are a wandering tribe, subsisting on the produce of the reindeer, and differing from them in language and mode of life. The commerce of Kamtochatka is chiefly with Okhotsk. Its exports are furs, of which 80,000 skins of all kinds are collected annually, oil, &c. Its imports are flour, sugar, dry goods, whiskey, rice, and coffee, almost all passing through the port of Petropavlovsk, the capital, on Avatska bay. The other ports are Bolsheretsk, a small harbor on the W. coast, and Lower Kamtchatka, on Kamtochatka river, with 100 inhabitants. Among the many persons banished to Kamtochatka by the Russian government was the celebrated adventurer Beniowsky.

**KANAWHA**, a W. co. of Va., drained by Great Kanawha, Elk, Coal, and Pocantico rivers; area, 1,176 sq. m.; pop. in 1850, 15,853, of whom 3,140 were slaves. The surface is mountainous, and the uplands are mostly covered with timber. Coal is abundant, and salt is obtained from numerous springs. The prevailing geographical formation is sandstone. The valleys are fertile, and the productions in 1850 were 852,995 bushels of Indian corn, 35,074 of wheat, 58,596 of oats, 2,014 tons of hay, 5,627 lbs. of tobacco, and 15,171 lbs. of wool. There were 83 salt works, 9 grist mills, 14 saw mills, 1 newspaper office, 25 churches, and 1,300 pupils attending public schools. The Lexington and Big Sandy railroad, now in course of construction, will pass through the county. Value of real estate in 1856, \$3,460,960, showing an increase of 21 per cent. since 1850. Capital, Charleston.

**KANAWHA RIVER**. See **GREAT KANAWHA**.

**KANE**, a N. E. co. of Ill., drained by Fox or Pishtaka river; area, 540 sq. m.; pop. in 1855, 26,665. The surface consists chiefly of rolling prairie, diversified by numerous small tracts of timber. The soil is fertile, and rests on a bed of limestone. The productions in 1850 were 337,598 bushels of Indian corn, 316,498 of wheat, 206,864 of oats, 23,244 tons of hay, 224,085 lbs. of butter, and 43,803 of wool. There were 6 grist mills, 10 saw mills, 3 newspaper offices, 18 churches, and 8,665 pupils attending public schools. The Galena and Chicago union, the Fox river valley, and the Chicago, Burlington, and Quincy railroads pass through the county. Capital, Geneva.

**KANE, ELISHA KENT**, M.D., an American arctic explorer, born in Philadelphia, Feb. 3, 1820, died in Havana, Feb. 16, 1857. He was the son of Judge John K. Kane of Philadelphia. The anecdotes narrated of his boyhood show

him to have been during that time generous and high-spirited, with a great natural sense of courtesy. He was especially distinguished by physical hardihood and perseverance. In 1836 he entered the Virginia university, where he devoted himself principally to the study of natural science and mathematics under Profs. Rogers and Bonnycastle. He was rapidly qualifying himself for the profession of a civil engineer, when in 1838 he left the university, owing to a disease of the lining membrane of the heart, from which he never fully recovered. As it was now impossible for him to become a civil engineer, he began in 1839 the study of medicine in the office of Dr. William Harris of Philadelphia. On Oct. 19, 1840, he was elected, while still an undergraduate and not of age, resident physician in the Pennsylvania hospital. On graduating he wrote an inaugural thesis on kystein, a substance discovered in 1831. The positions advanced in this thesis were subsequently approved by many eminent medical men both in America and Europe. His health still continuing bad, his father obtained for him a warrant of examination for the post of surgeon in the navy, and after admission he sailed in the frigate *Brandywine* with Commodore Parker, in May, 1843, as physician to the embassy to China. During the voyage, while his ship was detained at Rio de Janeiro, he witnessed the coronation of the empress of Brazil, and visited the eastern Andes, examining with such care as time permitted the geology of the region. The American legation being delayed for several months at Bombay, Dr. Kane availed himself of the opportunity to visit the cave temples of Ellora and Carlee, and to travel in Ceylon. Finally the expedition reached Macao, where it remained for nearly 7 months. During this time Dr. Kane, having provided a substitute, crossed the China sea to Luzon, where, having many friends, he was enabled to make a more complete examination of the Philippines than any foreigner had at that time effected. He traversed Luzon from Manila to the Pacific coast, and accomplished an extraordinary feat in descending the crater of the great volcano of Taal. "Only one European had attempted this before," says the biographer of Dr. Kane, "and he without success." Returning to Whampoa, he was present at the entertainments and ceremonies given by the American legation and by Chinese dignitaries. In visiting Chinese cities and their environs he displayed great courage and remarkable activity. Fletcher Webster, secretary of the legation, wrote of him at Macao: "He had explored the whole town itself before we of slower motions had commenced." He remained after the legation had left China, and was engaged for 6 months in successful practice as a physician at Whampoa, where he was attacked at the close of 1844 by fever, which so debilitated him that he resolved to return home. Setting out for that purpose, he visited Borneo and Sumatra, and with a traveling companion, Mr. Dent, returned from Singapore to Ceylon, and spent several months in

exploring the interior of India, including the ascent of the Himalaya mountains. Having been invited by Dwarkanath Tagore, a wealthy Hindoo who was preparing to visit the English court, to join his suite, Dr. Kane availed himself of the opportunity to go as far as Egypt, through Persia and Syria. Parting from the prince at Alexandria, he traversed Egypt, going as far south as Sennaar, and becoming acquainted with Lepsius. He had the misfortune to lose his baggage and papers, and having been wounded in fighting with Bedouin robbers, he returned to Alexandria, where he had an attack of the plague, which nearly cost him his life. Scarcely recovered, he set out for Greece, which he traversed on foot, and then passed from Patras to Trieste. He now travelled through Germany and Switzerland, making in the latter country careful studies of the glaciers, which he afterward found of service in illustrating his theories of the arctic regions. From Switzerland he went to Italy, France, and England, and from England returned home. On May 25, 1846, he sailed in the U. S. frigate *United States*, under Commodore Reed, for the coast of Africa. Having in Brazil in 1843 obtained letters of introduction from the famous slave dealer Da Souza to his agents in Africa, Dr. Kane was enabled to inspect the factories, and joining a caravan visited Dahomey, where he became well acquainted with the sovereign. But in returning to the coast he was attacked by the fever of that region, and finally reached Philadelphia, April 6, 1847, much weakened in health. Having obtained a transfer of his appointment from the naval to the military staff, he set out on Nov. 6 for Mexico. Being desirous of reaching the city in time to take part in the war, he went from Perote with the guerilla spy company of Dominguez. On the way he was concerned in a desperate encounter with a Mexican party, performing many feats of heroism in defence of prisoners against his own men after the victory. Generals Gaona and Torrejon were among the persons thus saved. Dr. Kane received a lance wound and had his horse killed under him. He was most kindly tended by the family of Gaona, and having been carried to Mexico on a hospital ambulance was there invalided and returned home. In Jan. 1849, he sailed in a store ship to Rio Janeiro, Lisbon, and the Mediterranean, returning in October. In May, 1850, he sailed from New York as surgeon and naturalist to the expedition under Lieut. De Haven, fitted out at the cost of Mr. Henry Grinnell, to search for Sir John Franklin. A brief account of this expedition, of which Dr. Kane published an interesting narrative, is given in the article *ARCTIC DISCOVERY*. His health was restored during his adventures in the polar snows, but it was very severely tried after his return to America by extreme literary and intellectual exertion. The disappointment which had attended the return of the unsuccessful English and American expeditions had only increased the public desire to ascertain the fate of Franklin. More vigor-

ous efforts were to be made, and Dr. Kane was desirous of taking part in them. When so ill as to be incapable of writing a long letter, he wrote to Mr. Grinnell, offering his services. Finally, through the liberality of Mr. Grinnell and Mr. George Peabody, \$10,000 and a vessel were secured. To forward this expedition, Dr. Kane contributed his own pay (about \$3,000) and the proceeds of the lectures which he delivered in 1852-'3. While thus employed he found an additional burden in the task of defending De Haven's priority of discovery of Grinnell Land at the head of Wellington channel, an honor claimed by the English. The expedition was at last ready to sail, Dr. Kane receiving the command, the government furnishing 10 men, with rations and apparatus from the medical bureau, and the Smithsonian institution and national observatory supplying valuable scientific assistance. The *Advance* sailed from New York, May 30, 1853, and the surviving officers and crew reached home again in Oct. 1855, having been forced to abandon the brig in the ice, and to travel with sledges and boats for 84 days to the Danish settlements on the coast of Greenland, where they met the expedition sent out for their relief under Capt. Hartstene. No traces of Sir John Franklin's party had been found. The most striking result of the voyage was the discovery of the open polar sea, the existence of which Dr. Kane had maintained in a paper read before the American geographical society, Oct. 14, 1853. The story of the sufferings and discoveries of this heroic band of explorers was told by Dr. Kane in his "Second Grinnell Expedition in Search of Sir John Franklin" (3 vols. 8vo., Philadelphia, 1856). Gold medals were awarded to him by congress, by the legislature of New York, and by the royal geographical society of London. He also received the queen's medal given to arctic explorers between the years 1818 and 1856, and a testimonial from the British residents of New York city. Dr. Kane's health now gave way again, and soon after completing his narrative he sailed for England, accompanied by Morton, who had been his attendant in the last voyages. In London he grew rapidly worse. Finding himself sinking, he sailed on Feb. 17 for St. Thomas, whence he went to Havana, being attacked during the voyage by a paralytic stroke. On Dec. 25 he reached Havana, where he died as he was about to be removed to the United States.—See "Life of Dr. E. K. Kane," by William Elder, M.D. (8vo., Philadelphia, 1857).

**KANGAROO**, a marsupial animal, whose numerous species constitute the family *Macropodidae*, peculiar to Australia and the neighboring islands. The marsupial characters will be given in the article **MARSUPIALS**. The dentition is as follows: incisors  $\frac{1}{2}$ ; canines none or one on each side in the upper jaw, premolars  $\frac{1}{2}$ ; molars  $\frac{1}{2}$ ; the upper incisors are large and broad, some of them resembling those of man, often arched, grooved, and dilated at the end; the lower incisors are horizontal, compressed, lan-

ceolate, with cutting margins; the molars are broad, tuberculated, with nearly quadrangular crowns; in many of the species the lower incisors may be separated by means of the loose connection of the branches of the jaw at the chin. The head is elongated, the upper lip cleft, the muzzle entirely or nearly naked, ears large, eyelashes springing directly from the lids; the clavicles weak and slender, especially in the large species; fore limbs usually very small in proportion to the hind; the hands naked beneath, with 5 well developed fingers, each armed with a strong curved claw; the hind legs large and powerful; the foot long, 4-toed, the 1st or inner toe being absent, the 2d and 3d long, slender, and so united by integument as to resemble a single toe with a double nail; nails distinct and hollow beneath; 4th hind toe much developed, with a large solid claw, the 5th smaller with a strong claw; tail long, thick at the base, and usually very powerful; the marsupial pouch well developed and opening forward; mammae usually 4; stomach complex, and caecum long and simple. Kangaroos are vegetable feeders, browsing like ruminants, and like these, according to Owen, occasionally chew the cud; they vary in height from that of a man to that of a hare, but when browsing apply the fore feet to the ground; at other times they rest upon the tripod formed by the hind legs and powerful tail, with the fore part of the body inclining slightly forward. They are the only marsupials which are not of nocturnal habits.—Of the 30 species described, the largest and the best known is the great kangaroo (*Macropus giganteus*, Shaw), discovered in 1770 on the coast of New South Wales during Cook's first voyage; an adult male in the British museum measures  $5\frac{1}{2}$  feet from tip of nose to root of tail, the latter being  $3\frac{1}{2}$  feet additional, the head  $8\frac{1}{2}$  inches to the ears, ears about 5 inches, length of forearm and hand (without the claws) 17 inches, and of tarsus alone  $15\frac{1}{2}$  inches; the female is about  $\frac{1}{2}$  smaller. The hair is moderately long and soft, of a general gray brown above and paler below, toes and end of tail black. It prefers low grassy hills and plains and open districts, where it browses upon the herbage and low bushes, retiring from the heat of mid-day under the shelter of the ferns and tall grasses. At the least alarm it raises itself on the hind legs and tail, its height enabling it to command a very extensive view; exceedingly timid, with acute senses of smell and sight, it is difficult to approach, but occasionally falls a victim to the spears and traps of the natives who hunt it for food; the English colonists pursue it so successfully with hound and gun that it is now rarely seen except in the interior. The kangaroo sometimes turns upon his canine enemies, and will either rip them open with the sharp hind feet, or clasp one in his fore paws leap to some water hole and drown it; the unwary human hunter may meet a similar fate. One of the principal uses of the peculiar Australian weapon, the boomerang, which

may be made to fall in advance of or behind the thrower, is to destroy the timid and wary kangaroo. Though nearly as awkward as a bat when browsing, it is a most fleet and graceful animal when making its enormous bounds, sometimes clearing a rod at a leap. The fore feet are prehensile, and are used in the various offices connected with the care of the young. Kangaroos are not generally gregarious. The skin is valuable for leather, which is esteemed for shoes and gloves; the fashionable gentry of Sydney, N. S. W., will not wear any boots and shoes not made of the skin of the Tasmania brush kangaroo; the flesh is also considered a delicacy. Prof. Owen has ascertained that the gestation in the *M. giganteus* is 29 days; the young when first born resemble, according to observations made at the London zoological gardens by him, earth worms in color and semi-transparency, the body being bent upon itself, the short tail tucked in between the hind legs, and these last  $\frac{1}{2}$  shorter than the fore legs; the whole length, when stretched out, was  $1\frac{1}{2}$  inches. As soon as born, the young are placed in the mother's pouch, which is held open by her fore paws while they are taken up by her mouth. There is no vascular connection between the young kangaroo and the nipple; when separated by force, the milky secretion is seen oozing out; the young seem unable to regain the nipple, which is sometimes replaced in the mouth by the mother; the teat has a circular enlargement at the tip, which makes it easy to be retained. Though the young can firmly grasp the nipple by the lips, it cannot draw the milk without the aid of the mother, which by the action of a muscle in the mammary gland can inject this fluid into the mouth of the suckling; lest the act of injection, when not coinciding with that of suction, should endanger the life of the foetus from suffocation, the cartilages of the larynx are so arranged that the opening of the glottis is placed at the top of a cone which projects, as in whales, into the posterior nostrils, so that the stream of milk passes on each side into the gullet without the possibility of entering the windpipe—a most striking example of creative design for the protection of this embryonic creature.—The sub-genus *lagorchestes* (Gould) includes a few small kangaroos with the muffle clothed with velvet-like hairs; *halmaturus* (F. Cuv.) comprises those in which the muffle is naked in front; *heteropus* (Jourdan) contains the rock kangaroos, with compact body, hind feet comparatively short and rough beneath, hairy tail, and naked muffle. In the tree kangaroos (*dendrolagus*, Müller) the fore legs are almost as long and strong as the hind legs, with pointed claws, and the tail is long, bushy, and cylindrical; they ascend trees with facility. The rat kangaroos constitute the genus *hypiprymnus* (Illiger), called also potoroos; they are about the size of a rabbit, with upper canines, compact body less elongated anteriorly, and with the toes of the fore feet unevenly developed, the 3 central ones the longest, with

solid nails compressed and broadest above; they feed on roots which they dig up with their fore paws.—Fossil kangaroos have been found in the limestone caverns and alluvial deposits of Australia, of which the *M. Atlas*, *Titan*, and *Goliath* (all of Owen) were at least  $\frac{1}{2}$  larger than any living species. The fossil genera *diprotodon* and *nototherium* of Owen, the former superior and the latter equal to the rhinoceros in bulk, found in the alluvial deposits of the Australian Condamine river, are considered by him to have been marsupials coming near the kangaroos and the wombats.

KANKAKEE, a N. E. co. of Ill., bounded E. by Ind. and drained by Kankakee and Iroquois rivers; area about 590 sq. m.; pop. in 1855, 10,110. It has a level surface, and consists chiefly of prairie with some swamps. Coal and limestone are found. The Chicago branch of the Illinois central railroad passes through Kankakee City, the capital. The county was formed from Will and Iroquois in 1851.

KANO, the largest and most important province of Houssa in central Africa, occupying the N. portion of that country. It comprises a fertile district of considerable extent, producing cotton, indigo, tobacco, and abundant crops of the chief cereals, beside sorghum, sweet potatoes, yams, dates, and a variety of other vegetables and fruits. The manufacture of dyed cotton cloths is extensively carried on. The principal city is Kano, beside which there are upward of 30 walled towns and numerous villages. The population probably exceeds 500,000, of whom 200,000 are slaves. The governor is able to raise an army of 7,000 horse and 20,000 foot; and he levies an annual tribute of 100,000,000 cowries, beside presents from merchants.—The city of KANO, the capital of the province, and the most important centre of manufactures and commerce in Houssa, is situated on a fertile plain in lat.  $12^{\circ} 0' 19''$  N. and long.  $8^{\circ} 30' E.$ ; pop. about 40,000, nearly half of whom are slaves. In busy times the influx of foreigners and merchants swells the population to upward of 60,000. The city is surrounded by a well built clay wall 30 feet high, having 14 gates defended by guard houses, and making a circuit of more than 15 miles; but not more than a third of the space enclosed by the walls is occupied by houses, the remainder being appropriated to gardens and cultivated fields, whence, in case of a protracted siege, the inhabitants may derive a sufficient supply of corn for sustenance. The principal article of commerce is the cotton cloth woven and dyed here of various colors, and which is exported to many parts of central and northern Africa. The fine cotton fabrics in such extensive demand in Timbuctoo, and which have been supposed to be produced there, are in fact derived chiefly from Kano. Dr. Barth estimates the value of this export at 300,000,000 cowries. Among other articles of export are hides, dyed sheepskins, the kola nut, ivory, sandals, &c. The slave trade is an important branch of na-

tive commerce, and about 5,000 slaves are annually exported, beside many sold for domestic use. The principal European goods imported are printed muslins and calicoes from Manchester, silks, needles, razors, sword blades, and various other kinds of hardware. This trade has recently met with a vigorous rival in the shape of American productions brought to the western coast and exchanged for slaves.

KANSAS, a territory of the United States, lying between lat.  $37^{\circ}$  and  $40^{\circ}$  N. and long.  $94^{\circ} 40'$  and  $106^{\circ} 50'$  W., bounded N. by the territory of Nebraska, E. by the state of Missouri, S. by the Indian territory and New Mexico, and W. by New Mexico and Utah. With the exception of the N. E. corner of the territory, where the boundary line follows the irregular course of the Missouri river, its shape is that of a parallelogram as far W. as long.  $108^{\circ}$ ; the boundary then follows this meridian N. to lat.  $38^{\circ}$ , and runs W. along that parallel to long.  $106^{\circ} 50'$ , thence N. to about lat.  $39^{\circ} 20'$ , E. to long.  $105^{\circ} 40'$ , and finally N. again until it meets the Nebraska frontier. Length, E. and W., 550 m.; breadth, E. of long.  $108^{\circ}$ , 208 m.; W. of that line, 139 m.; area, 114,798 sq. m., or 73,000,000 acres, about  $\frac{1}{4}$  of which is unfit for cultivation. The territory is divided into 37 counties, viz.: Allen, Anderson, Atchison, Bourbon, Butler, Breckinridge, Brown, Chase, Clay, Coffey, Davis, Doniphan, Dorn, Douglas, Franklin, Greenwood, Hunter, Jackson, Jefferson, Johnson, Leavenworth, Linn, Lykins, Madison, Marshall, McGee, Morris, Nemaha, Osage, Potawatamie, Riley, Shawnee, Wabonse, Washington, Wilson, Woodson, and Wyandot. The principal cities and towns are Atchison, Doniphan, Elwood, Lawrence, Leavenworth, Lecompton (the capital), Manhattan, Osawatamie, Tecumseh, and Topeka. The population of 31 counties, according to the returns made by assessors in 1859, was 69,950; but the actual population of the territory is believed not to fall short of 120,000. The principal rivers are the Kansas, rising in the Rocky mountains in 2 branches called Republican and Smoky Hill forks, which unite at Fort Riley, and joining the Missouri near Kansas City after a nearly due E. course of 120 m. from Fort Riley, to which point it is navigable; the Osage, the Neosho, and the Verdigris, which drain the eastern part of the territory, and run generally E. or S. E.; the Arkansas, rising among the Rocky mountains in the W., and, after coursing E. through about  $\frac{1}{4}$  of Kansas, turning S. E. into the Indian territory; the Red fork of Arkansas river, which waters the S. part; and a number of small tributaries of Platte river in the N. W. The streams generally have broad shallow channels, and with the exception of the Kansas are not available for navigation. The surface of eastern Kansas is chiefly undulating, with here and there an elevation of considerable height. The general inclination of the ridges is N. and S. The middle portion of the territory is more level, and the western is much broken, both by the Rocky mountains, whose

spurs extend some 80 or 100 m. E. of the Utah frontier, and by eminences called "buttes," varying in width from 100 feet upward, with flat tops and nearly perpendicular sides, apparently formed by the subsidence of the surrounding land. The principal elevation of the Rocky mountains in Kansas is Pike's peak. The general aspect of the three regions which we have mentioned varies greatly. The eastern presents a succession of rich prairies, grass-covered hills, and fertile valleys, with an abundance of timber, on the streams; the middle is thinly wooded, and partly occupied by a vast desert extending into New Mexico; and the western has every requisite for a fine grazing country, with many tracts of forest. The prevailing rock is limestone, which crops out from the surface, or lies scattered over the ground in the form of bowlders. Sandstone is also abundant in certain localities. The soil, particularly in the E., is rich and deep, consisting generally of a black loam, sometimes mixed with sand. In the river bottoms it is exuberantly fertile, and the decomposition of the limestone which forms the base of many of the bluffs and the beds of rivers constantly adds to its productiveness. The climate is mild and agreeable. The winters are short, and snow seldom falls in large quantities. The months of February, March, and April are marked by sudden changes of temperature and fierce winds. The rainy season is from May 10 to June 10; there is very little rain in midsummer or autumn, and the annual fall is less than 30 inches. The thermometer sometimes rises to  $115^{\circ}$  F. in summer, but the air is tempered by breezes, and the nights are almost always cool. The territory is considered extremely healthy. The most important mineral products of Kansas are coal (the Missouri fields extending into this territory), gypsum, granite, quartz, porphyry, feldspar, and gold. The last will be noticed in the article PIKE'S PEAK. The buffalo, elk, deer, antelope, prairie dog, squirrel, horned frog, prairie hen, grouse, wild turkey, wild goose, and many varieties of small birds are found. The timber trees are elm, yellow oak, black walnut, hickory, cottonwood, sycamore, basswood, &c.; they are mostly confined to the intervals of the larger streams, their growth elsewhere being checked by fires which often sweep over the prairies. Although abundant, few kinds except the oak and black walnut are suitable for cutting into planks, and building material at present is transported from New York and other distant places. The soil and climate are adapted to all the cereal crops, hemp, sorghum, and the fruits and garden vegetables common in the eastern states. Cotton has been cultivated in S. Kansas. Beside the white settlers, the territory has a considerable population of wild and partly or wholly domesticated Indians. The interior and W. parts are occupied by Camanches, Klowas, Cheyennes, Arapahoes, and other wandering tribes. In 1868 the territory contained the following Indian reservations: New

York Indians, 1,658,880 acres; Potawatamies, 756,000; Kansas, 256,000; Delawares, 256,000; Ottos and Missouris, 160,000; Kickapoos, 128,000; Sacs and Foxes, 82,000; Wyandots, 24,960. For protection against hostile tribes the U. S. government has military posts at Forts Leavenworth and Riley. The country is as yet almost without works of internal improvement. The roads are bad, and there are few ferries or bridges.—Kansas was annexed to the United States in 1803 as part of the territory bought from France under the general designation of Louisiana. By the Missouri compromise bill of 1820 it was provided "that in all the territory ceded by France to the United States under the name of Louisiana which lies N. of lat. 36° 30' N., excepting only such part thereof as is included within the limits of the state (Missouri) contemplated by this act, slavery and involuntary servitude, otherwise than in the punishment of crime whereof the party shall have been duly convicted, shall be and is hereby for ever prohibited." By an act of congress passed in May, 1854, the territories of Kansas and Nebraska were organized, and in section 14 of this act it was declared that the constitution and all the laws of the United States should be in force in these territories except the Missouri compromise act of 1820, "which . . . is hereby declared inoperative and void." About a month previously the legislature of Massachusetts had incorporated the Massachusetts emigrant aid company, for the purpose of assisting emigrants to settle in the new territories, by giving them useful information, procuring them cheap passage over railroads, and by establishing mills and other conveniences at central points in the new settlements. In July the legislature of Connecticut granted a charter to a similar company. A large emigration into Kansas from the N. W. states had already taken place, and emigrants in considerable numbers from the free states and a few from the slave states now availed themselves of the opportunities for cheap transportation offered by these companies to settle in Kansas. A party of 80 men led by Mr. Branscomb founded the town of Lawrence, and were soon after joined by 60 or 70 more led by Mr. Charles Robinson and Gen. Pomeroy. Settlers from Missouri were at the same time passing into Kansas, in many cases taking their slaves with them. On July 29, 1854, a public meeting, called by the "Platte County Defensive Association," was held at Weston, Mo., and resolutions were adopted declaring that the association would hold itself in readiness, whenever called upon by any of the citizens of Kansas, "to assist in removing any and all emigrants who go there under the auspices of northern emigrant aid societies." These resolutions were published, signed by G. Galloway, president, and B. F. Stringfellow, secretary. On Aug. 12 another meeting was held at Weston, at which resolutions offered by Mr. Stringfellow were adopted, declaring in favor of the extension of

slavery into Kansas. Almon H. Reeder of Pennsylvania had been appointed governor of Kansas, and arrived in the territory Oct. 6. An election for a territorial delegate to congress was held Nov. 29. The polls were taken possession of by armed bands from Missouri, and out of 2,871 votes cast it was subsequently estimated by a congressional investigating committee that 1,729 were illegal. On March 30, 1855, another election for members of the territorial legislature was held, and the polls were again taken possession of by large bodies of armed men from Missouri, who, after electing pro-slavery delegates from every district, returned to their own homes in the adjacent state. From the investigation by the congressional committee it appeared that out of 6,218 votes cast at this election, only 1,810 were legal, of which 791 were given for the free state or anti-slavery candidates. From 6 of the districts, evidence of the illegal nature of the proceedings having been laid before Gov. Reeder, he set aside the returns and ordered new elections in those districts, which resulted in the choice of free state delegates, except at Leavenworth, where the polls were again seized by Missourians. Gov. Reeder soon after visited Washington to confer with the federal authorities, and after his return his removal from the office of governor was announced, July 26, for the alleged reason of irregular proceedings in the purchase of Indian lands. The territorial legislature assembled at Pawnee, July 8, and remained in session till Aug. 30. One of their first acts was to expel the free state men chosen at the second elections ordered by Gov. Reeder, and to give their seats to the pro-slavery men originally returned. They also passed an act making it a capital offence to assist slaves in escaping either into the territory or out of it; and felony, punishable with imprisonment at hard labor from 2 to 5 years, to conceal or aid escaping slaves, to circulate anti-slavery publications, or to deny the right to hold slaves in the territory; also an act requiring all voters to swear to sustain the fugitive slave law; and they also adopted in a body the laws of Missouri. Wilson Shannon of Ohio was appointed governor in place of Mr. Reeder, and assumed office Sept. 1. A few days later a convention of the free state party was held at Big Springs, and, after protesting against the acts of the legislature, nominated ex-Governor Reeder as delegate to congress, and appointed Oct. 9 as the time for holding the election, when Gov. Reeder received about 2,400 votes. At the same time delegates were chosen to a constitutional convention, which assembled at Topeka Oct. 28, and sat till Nov. 11, when they promulgated a constitution for the state of Kansas in which slavery was prohibited. The contest between the free state and pro-slavery parties now grew to such a pitch of violence that several men were killed on each side, and the people of Lawrence began to arm for self-defence. The governor called out the militia. A large number of Missourians enrolled themselves as

Kansas militia, and Lawrence for some days was in a state of siege; but the difficulty was temporarily adjusted by negotiation, and the Missourians retired to their own state. On Dec. 15 the people voted upon the question of accepting the Topeka constitution, and it was accepted with only 45 votes against it, exclusive of Leavenworth, where the polling was prevented by an inroad from Missouri. On Jan. 15, 1856, an election was held for state officers and a legislature under the Topeka constitution, and Charles Robinson was chosen governor. The legislature met at Topeka, March 4, and, after organizing and inaugurating the governor and other officers, adjourned to July 4. Early in April a considerable body of armed men from Georgia, Alabama, and other southern states, led by Major Buford, arrived in Kansas. On the 17th of the same month a special committee of the U. S. house of representatives, appointed about a month before, and charged to investigate the troubles in the territory of Kansas, arrived at Lawrence. The result of their investigations was a report by the majority of the committee, Messrs. Howard of Michigan and Sherman of Ohio, in which they said: "Every election has been controlled, not by the actual settlers, but by citizens of Missouri; and as a consequence, every officer in the territory from constable to legislators, except those appointed by the president, owe their positions to non-resident voters. None have been elected by the settlers, and your committee have been unable to find that any political power whatever, however unimportant, has been exercised by the people of the territory." Mr. Oliver of Missouri, the third member of the committee, made a minority report, in which he said: "It must have been apparent to all, that the report of the majority was not only *ex parte* and one-sided, but highly partisan in its character from beginning to end. This appears all through the paper, in the manner of their statement of all things referred to by them as facts, many of which statements of facts thus made rest upon no evidence whatever collected by the committee. . . . There is no evidence that any violence was resorted to, or force employed, by which men were prevented from voting, at a single election precinct in the territory, or that there was any greater disturbance at any election precinct than frequently occurs in all our state elections in exciting times." On May 5 the grand jury of Douglas county found indictments against Reeder, Robinson, Lane, and other free state leaders, for high treason, on the ground of their participation in the organization of a state government under the Topeka constitution. Reeder and Lane escaped from the territory, but Robinson was arrested and kept in prison for 4 months. The U. S. marshal took Buford's men into pay, and armed them with government muskets. Lawrence was again besieged by a large force, and on May 21, under a promise of safety to persons and protection to property, the inhabitants gave up their arms to the sheriff.

The invaders immediately entered the town, blew up and burned the hotel, burned Mr. Robinson's house, destroyed two printing presses, and plundered several stores and houses. A state of civil war now spread through the territory, the free state party being furnished with contributions of arms and money from non-slaveholding states. On May 26 a fight occurred at Potawatamie, in which 8 men were killed, and on June 2 another at Palmyra or Black Jack, which resulted in the capture of Capt. Pate of South Carolina and 80 of his men. Similar affairs, attended with more or less loss of life, continued to occur for 8 or 4 months. Parties of emigrants from the free states on their way through Missouri were in many cases stopped and turned back. The free state legislature met at the appointed time (July 4) at Topeka, and was forcibly dispersed by U. S. troops under Col. Sumner. On Aug. 14 the free state men assailed and took a fortified post near Lecompton, occupied by Col. Titus with a party of pro-slavery men, and captured Titus and 20 other prisoners. On Aug. 17 a treaty was agreed to between Gov. Shannon and the free state men, by which Shannon restored the cannon taken at Lawrence, and received in exchange Titus and the other prisoners. A few days later Shannon received notice of his removal from office, John W. Geary of Pennsylvania being appointed in his stead. Mr. Woodson, the secretary of the territory, and acting governor before Geary's arrival, on Aug. 25 issued a proclamation declaring the territory to be in a state of rebellion. He collected a considerable armed force at Lecompton, while another body, amounting to 1,150 men, assembled under the Hon. David Atchison, late U. S. senator from Missouri, at a point called Santa Fé. On Aug. 29 a detachment from Atchison's army attacked Osawatamie, which was defended by about 50 men, who made a vigorous resistance, but were defeated with the loss of 2 killed, 5 wounded, and 7 prisoners. Five of the assailants were killed, and thirty buildings were burned. The next day a body of free state men marched from Lawrence to attack Atchison's army. On their approach the latter retired and withdrew his forces into Missouri. On Sept. 1 the annual municipal election took place at Leavenworth. A party, chiefly from Missouri, killed and wounded several of the free state men, burned their houses, and forced about 150 to embark for St. Louis. On Sept. 8 Gov. Geary arrived at Lecompton, and Robinson and the other prisoners held on a charge of treason were released on bail. The governor on assuming office issued a proclamation calling upon all bodies of armed men to disband. He also promised protection to the free state men, who accordingly laid down their arms. The Missouri men, however, immediately assembled to the number of upward of 2,000, forming 8 regiments with pieces of artillery, and marched to attack Lawrence, under command of a member of the Missouri legislature. Gov. Geary with a force

of U. S. soldiers interposed between them and Lawrence, and finally prevailed upon them to retire. During their retreat a free state man named Buffum was shot down by a man named Haynes almost in the presence of the governor, who subsequently caused the arrest of Haynes on a charge of murder. The U. S. district Judge Lecompte, who was noted as an active partisan, liberated Haynes on bail, and afterward on *habeas corpus*. Thereupon Gov. Geary forwarded a representation to Washington demanding the judge's removal, and about the middle of December James C. Harrison of Kentucky was appointed in his place. Gov. Geary now reported to the president that peace and order were completely reestablished in Kansas. On Jan. 6, 1857, the legislature elected under the Topeka constitution met at Topeka, and organized next day. The U. S. marshal immediately arrested the president of the senate, the speaker of the house, and about a dozen of the leading members, whom he carried prisoners to Tecumseh on the charge of "having taken upon themselves the office and public trust of legislators for the state of Kansas, without lawful deputation or appointment." The houses, being left without a quorum, met the next day and adjourned till June. Shortly afterward the territorial legislature, composed entirely of pro-slavery men, chosen at an election in which the free state men had declined to participate on the ground of its illegality, met at Lecompton, and among other acts passed one providing for the election of a convention to frame a state constitution for Kansas. Meanwhile the house of representatives at Washington had passed a bill declaring void all the enactments of the territorial legislature, on the ground that they were "cruel and oppressive," and that "the said legislature was not elected by the legal voters of Kansas, but was forced upon them by non-residents." This bill, however, did not pass the senate, and that body refused to confirm the appointment of Harrison in place of Lecompte, who thus remained chief justice of Kansas, never having been actually dismissed. Upon this Gov. Geary resigned his office and quitted the territory. Robert J. Walker of Mississippi was appointed his successor, with Frederic P. Stanton of Tennessee for secretary. The election for delegates to the constitutional convention was held on June 15. The free state men generally took no part in it, on the ground that the legislature which ordered it had no legal authority, and that if they attempted to vote they would be defrauded and overborne by intruders from Missouri. About 2,000 votes were cast, while the legal voters in the territory by a recent census numbered about 10,000. At the territorial election held a few months later, the free state men, being assured by Gov. Walker of protection from intruders, went to the polls and cast about 7,600 votes, to 3,700 votes thrown by the opposite party, electing Marcus J. Parrott delegate to congress, together with 9 of the 17 councilmen and 27 of the 89 representatives.

An attempt was made to change this result by means of a false return from Oxford, Johnson co., a place containing 11 houses. It was alleged that at this place 1,624 persons had voted, and a corresponding roll of names was sent in, which on examination proved to have been copied in alphabetical order from a Cincinnati directory. This return, which, if accepted, would have changed the party character of the legislature by transferring from the free state to the pro-slavery side 8 representatives and 8 councilmen, was rejected by Gov. Walker as a manifest falsification. Soon after the territorial election the constitutional convention met at Lecompton and adopted a constitution, 4 sections of which related to slavery, declaring the right of owners to their slaves to be inviolable, and prohibiting the legislature from passing acts of emancipation. This provision alone was to be submitted to the electors at an election to be held on Dec. 21. The ballots cast were to be endorsed: "Constitution with slavery" or "Constitution with no slavery," thus securing in any event the adoption of the constitution, several clauses of which, beside those thus submitted, were highly objectionable to a majority of the people. A provision was inserted in the schedule annexed to the constitution preventing any amendment of that instrument previous to 1864. The promulgation of this constitution caused great excitement in Kansas. Gov. Walker condemned it in the strongest manner, and proceeded at once to Washington to remonstrate against its adoption by congress; but before his arrival there the act had received the approval of the president. Gov. Walker soon after his arrival in Washington resigned, and J. W. Denver of California became governor. At the election of Dec. 21 for the adoption or rejection of the slavery clause, the vote returned was 8,148, more than half of which was from counties along the Missouri border, whose total number of voters by the census did not exceed 1,000. Against the slavery clause there were 669 votes, the free state men generally abstaining from voting. The constitution being thus nominally adopted, an election for officers under it was to be held on Jan. 4. The territorial legislature at a special session passed an act submitting the Lecompton constitution to the direct vote of the people on the same day with the Lecompton state election, and the result was a majority of 10,226 votes against it. Congress after long discussion referred the matter to the people of Kansas at an election on Aug. 3, 1858, when the Lecompton constitution was again rejected by 10,000 majority. Meantime, the territorial legislature had called another convention to meet in April to frame a new constitution, which was submitted to the people and ratified by a large majority, though by a small total vote. Shortly after the rejection of the Lecompton constitution by the people, Gov. Denver resigned, and Samuel Medary of Ohio was appointed in his place. The territorial legislature met in Jan. 1859, and passed an act submitting to the people the ques-

tion of calling still another constitutional convention. The election was held March 21, and the result was a majority of 8,881 in favor of holding a convention. An election was accordingly held for delegates, and the convention thus chosen met at Wyandot July 5, and adjourned July 27, after adopting a constitution prohibiting slavery. This constitution was submitted to the popular vote Oct. 4, and was ratified by about 4,000 majority. The first state election was held under it Dec. 6, and resulted in the choice of Charles Robinson for governor. Congress has not yet accepted this constitution (April, 1860).

KANSAS CITY, a city of Jackson co., Mo., on the Kansas frontier, situated on the right or S. bank of the Missouri river,  $\frac{1}{4}$  of a mile below the mouth of Kansas river, and 14 in. W. from Independence; pop. in 1855, about 600; in 1859, about 8,000. It is to be the W. terminus of a railroad from St. Louis, which is now (Jan. 1860) in running order 48 m. W. from Jefferson City, and is rapidly approaching completion. It is built on high ground and well laid out, with wide streets and houses chiefly of brick. It is an important station on the emigrant route to the far West *via* Kansas river, and the channel of an active trade. In 1859 the city had 2 daily and 4 weekly newspapers, 7 churches (1 Baptist, 1 Episcopal, 2 Methodist, 1 Presbyterian, 1 Reformed, and 1 Roman Catholic), 2 branch banks, an insurance company, several benevolent societies, a number of schools, including a German free school, a high school, and 2 female seminaries, an iron foundry, a saw mill, a flour mill, a tannery, a brewery, and 7 brick yards. It has also manufactures of agricultural implements, boots and shoes, &c., a large pork packing establishment, and several timber yards.

KANT, IMMANUEL, a German metaphysician, born in Königsberg, Prussia, April 22, 1724, died there, Feb. 12, 1804. He was of Scotch descent; his grandfather probably emigrated from Scotland near the close of the 17th century, and settled at Tilsit. His father, John George Kant, came to Königsberg in early life, and followed the trade of a saddler. His mother, Anna Regina Reuter, of German stock, was a woman of a refined and elevated character, and of deep religious feeling. The philosopher was the 4th of their 11 children. He tells us that when a boy he was idle and a truant; yet he also showed zeal in acquiring knowledge, and his parents gave him the best education their slender means would allow. Like Schelling and Hegel, he was first destined to the theological career. From his 8th to his 16th year he was a student in the *Collegium Fredericianum* of his native city, under the care of Dr. Schulz. Ruhnken the philologist was a fellow student, and they pursued together the study of the classics. Here, too, he felt the influence of pietism, then predominant in the college; and also learned the rudiments of the abstract philosophy of Wolf, which had the speculative

ascendency in philosophical and theological schools. But as yet he showed no metaphysical talent, though he was an indomitable worker. His character was influenced by the rigid morality and independence of his father, and the piety of his mother. In 1740 he entered the university as a student of theology; but his first attempts at preaching met with such poor success, that he concluded that he was destined for a different career, and applied himself with earnestness to mathematics and the physical sciences. His first essay, written in 1747, at the age of 22, was on "The True Measure of Living Forces," and contained an acute criticism of the arguments of Leibnitz and Descartes, with an attempt to mediate between the German and French schools, by distinguishing between dead and living powers. His father died in 1746; he had lost his mother 11 years before; and, that he might not be a burden upon his uncle, who had already aided him, he was compelled from that time until 1755 to become a tutor in private families. In the last of these, that of Herr von Kaiserling of Königsberg, his great talents and acquisitions were recognized, especially by the lady of the house; and here he was introduced into cultivated society, wearing off the bashfulness and reserve of a poor student. At length, in 1755, he was able to enter upon the career of academic instructor, for which he had been preparing himself by assiduous study and multifarious reading. His inaugural dissertations, as *magister legens*, were *De Igna*, and on the "First Principles of Metaphysical Science." In the same year he published anonymously a treatise on the theory of the heavens, dedicated to Frederic the Great, and written in a clear and animated style. Here he prophesied the discovery of new planets, and that the nebulae would be resolved into stars, beside advocating the position that a mechanical construction of nature was not adverse to the belief in a God. Lambert in 1761 advanced similar views, which led (1765-'70) to a correspondence between them. From the first he was a popular lecturer; several of his courses were always attended by many of the citizens of the active and thriving city of Königsberg, which had a high commercial and political, as well as literary rank. His course on physical geography was begun in 1757, and continued to the close of his academic career, receiving fresh additions at each repetition. Kant himself never went beyond his native province, and as seldom as possible away from the city; but he was an eager student of voyages and travels, and extracted all possible information from every traveller he could come across. He also lectured on practical anthropology, the theory of teaching, natural law, the philosophy of religion, ethics, logic, and mathematics. In 1762 he published a treatise on the "False Subtlety of the Four Syllogistic Figures," maintaining that only the first is "pure," that the others are *ratiocinia hybrida*. The next year he wrote an essay for a prize proposed by the Berlin academy on the "Principles of Natural

Theology and Ethics;" but Mendelssohn received the first, and Kant the *accessit* prize. He here says that a "real system of metaphysics had never yet been written;" he was already busy with this task. In the same year appeared his work on the "Only Possible Ground of Demonstrating the Being of God," proposing a new form of the ontological proof, and rejecting the other three arguments. Existence, he says, is not a predicate conception, and therefore cannot be proved; but the non-existence of God contains a logical contradiction. The new mode of proof which he advocates, says Erdmann (*Geschichte der Philosophie*, vol. iii. p. 81), reverses the positions of the schools of Descartes and Leibnitz; instead of inferring the existence of God as a consequence from the possibility, he takes the possibility as a consequence, and reasons back to the existence as the ground; if any thing is possible, there is some real being, the seat and source of all that is conceivable.—The year 1770 is made by Rosenkranz (*Geschichte der Kantischen Philosophie*, 1840, vol. xii. of Kant's works) the dividing line between the earlier or tentative period of his speculations, and the speculative and systematic period. In this year he became a professor in full in the university. For 15 years the subtlest and boldest thinker of Germany had been struggling along in obscurity, filling subordinate posts; for example, that of a subaltern in the royal library for \$50 a year, conferred on him in 1776, as an "accomplished" and "learned" person. He was indeed offered the professorship of poetry in 1764; but this does not seem to have suited him. The professorship of logic and metaphysics was given him after he had declined invitations to Jena and Erlangen; and his salary was to be \$300 per annum. He was content with his native city and university; he wanted to labor in quiet, and work out the great problems which were stirring his mind. His inaugural dissertation, *De Mundi Sensibilis atque Intelligibilis Forma et Principiis*, contains germs of his metaphysical system. He protests against the position that the knowledge of sense and that gained by the understanding are to be distinguished as respectively obscure and clear. There is, he says, a knowledge of sensible phenomena which is distinct, as there may be conceptions of the understanding which are confused. We must distinguish between the matter and the form of our knowledge of sensible objects; the form is given by the ideas of space and time, which are not objectively real, but pure intuitions; and these give us the basis of the sciences of mathematics and geometry. Intellectual knowledge is made up of pure or universal conceptions; not such as are abstracted from the phenomena of sense, but principles by which the understanding is guided, as those of necessity, possibility, causality, &c. Such are some of the positions in which he already arrays himself against materialism on the one hand and dogmatism on the other. In 1772 (Erdmann, *loc. cit.* 87) he writes about his scheme of a

transcendental philosophy, which he hopes to finish in 8 months; in 1776, it is to be completed the next summer; but not until 1781 did the "Criticism of the Pure Reason" make its appearance. For 11 years he had been writing and rewriting; the final draft was composed in a few months. He was already 57 years old. His system had been very slow in its growth; for a long time he was hardly conscious of what he was aiming at. He was pressed on the one hand by the abstract metaphysics of the idealism of Leibnitz as developed by Wolf; on the other hand, Hume's scepticism, as he says, "awoke him from his dogmatic slumbers." His own work was intended to give their respective rights to both idealism and realism, to metaphysics and materialism; yet, at the same time, to serve as a new basis on which the architectonics of the whole world of knowledge might be constructed. This system produced a revolution in the world of speculation. Partly from its profoundness, partly on account of its novel nomenclature, it was at first slightly noticed, and seemed in danger of lapsing into oblivion. But Kant was now thoroughly aroused, and eager in pressing the scheme, which was the product not only of his own life, but also of the chief systems which had gone before. His philosophical productivity became as remarkable as had been his previous reserve. In 1788 appeared his "Prolegomena to every future System of Metaphysics claiming to be a Science;" a more popular exposition, and also a more complete analysis, of the questions and problems mooted in the "Criticism." He then endeavored to counteract the negative results of the system of pure reason by his "Metaphysics of Ethics" (1785), and "Metaphysical Elements of Natural Science" (1786), completing the exposition of his views in these two branches of philosophy. In 1787 the second edition of the "Criticism of Pure Reason" was published, omitting the preface to the first edition, and altering it so as to avoid the charge of idealism which had been generally preferred against his speculations, identified, or rather confounded, by some opponents with the system of Berkeley. This second edition was afterward reprinted, with only verbal alterations, though considered as somewhat compromising the logic of his speculations; but in the two recent editions of Kant's works, by Hartenstein and Rosenkranz, the contents of the first edition are also inserted. The "Criticism of the Practical Reason" (1788) was intended to give the positive aspect of the new philosophy in relation to God, freedom, and immortality; it is a further exposition and application of what was given in outline in the "Metaphysics of Ethics," and it contributed to give currency to his system among those who had been repelled by the apparently negative conclusions of the "Criticism of Pure Reason." Such was the rigor and such the vigor of the ethical scheme here propounded, that for a time it swept away the unmanly eudæmonistic ethics and the sentimental systems of morality. Even

those who thought they detected an inconsistency between the principles of Kant's "Pure Reason" and of his "Practical Reason," hailed the latter work as containing solid proofs of the real being of those supersensible objects which the critical idealism seemed to have reduced to subjective ideas. Its principles were made the basis of systems of divinity, by such theologians as Tieftunk, Ständlin, Ammon, and somewhat later by Gabler and Wegscheider. The ethical element, the "categorical imperative," was held as the one fixed and saving point, in the midst of the jarring and opposite principles of the different schools in philosophy and theology; and this led to that rationalism, on a moral basis, which for a long time characterized German theology, a very different form of rationalism from the one which subsequently prevailed. To these works, in 1790, Kant added his "Criticism of the Judgment," which developed more fully the principles of the metaphysics of the natural sciences, and supplemented many positions in his other treatises, beside giving hints, and opening points of view, which were afterward used by those disposed to go beyond the principles of the critical philosophy. — With this work closed the productive metaphysical period of Kant's philosophic career. He was now 66 years old. In 9 years he had put forth, in rapid succession, a series of works which revived the slumbering activity of German philosophy; combated equally the abstractions of the dogmatist and the doubts of the sceptic; set forth the transcendental grounds and elements of knowledge, and thus laid the foundation for a new metaphysics; planted moral science upon a definite basis, giving it fixed and universal formulas; and which already began to affect the construction of the science of Christian theology. His subsequent writings form, according to his own statement, the practical period of his career, applying to different special sciences the principles he had elaborated. His philosophy was already expounded by Kiesewetter in Berlin, Schmid in Jena, Jakob in Halle, Born in Leipzig, and many others in different parts of Germany. Its more definite conflict with the orthodox theology was aroused by the publication of his essays on "Religion within the Bounds of Mere Reason," contributed to the Berlin *Monatschrift*, then prohibited by the censor (re-established in 1788), and issued in a volume in 1793. Political influences were also concerned; for Kant was in sympathy with the French revolution. Frederic William II. sent to him a missive indicating his displeasure, and the philosopher was obliged to give a pledge that he would not lecture on religious subjects, "so long as he should be a subject of his majesty," the promise being so worded that he considered himself released from it on the death of that monarch. But he was so irritated by this governmental interference, that in 1794 he gave up all his private lectures, and after 1797 no longer read in the university. In 1797 appeared his "Metaphysics of Ethics," in two parts, viz.: the

"Metaphysical Elements of Right" (law), and "of Virtue." The "Strife of the Faculties" (1798) is a review of the controversy about his religious opinions, with the documents. His "Anthropology in a Pragmatic Point of View" was published the same year. After this his friends and pupils became the editors of his writings: Jäsche of his "Logic" (1800); Rink of his "Physical Geography" (1802) and "Pedagogics" (1803). After his death Pölitiz published his lectures on the philosophy of religion (1817) and on metaphysics (1831), and Starke those on the human race (1831). He was disturbed, in his later years, by the symptoms of a new phase of speculation in the writings of Fichte (whom he had at first warmly welcomed, and whose work on revelation had been attributed to him), and sent forth an ineffectual protest in 1799; this showed a defect which he himself acknowledged in his power of appreciating other systems. An essay on which, in the decline of his faculties, he was for a long time employed, was found to be unintelligible, or only a repetition of what he had previously said upon the relation of physics to metaphysics. Speculation was already sweeping past the monuments he had reared. — To appreciate the character and position of the critical or transcendental philosophy of Kant, we must start with his own view of what philosophy had previously accomplished, and what he expected from his new method. In his own interpretation of the matter, it was the critical method, which he instituted, that formed the primary peculiarity of his scheme. All previous systems had led to dogmatism (Leibnitz and Wolf), or to scepticism (Hume). Dogmatism asserts the equal objective and subjective validity of its principles; metaphysical truths, like mathematical, hold both in reason and in fact. Scepticism, on the other hand, denies the objective validity of *a priori* truths; thus, for example, Hume could not find in experience any thing corresponding to the principle of causality, for sense gives only succession of phenomena; and this truth of causality, says Kant, is only one of a class, to all of which Hume's criticism is equally applicable. Both the dogmatist and the sceptic examine ideas or truths directly, and can never agree. Is there no other way of approaching the matter? Yes, says Kant, there is also the critical method; instead of assuming that our knowledge is determined by the objects, let us see how far the objects are determined by our knowledge. He compared this method, with a proud consciousness, to that of Copernicus, who, finding that he could not explain the motion of the heavenly bodies by supposing that they revolved around himself, tried whether he could not do better by supposing that he moved and the stars stood still. The true way, then, is to start with a criticism of man's power of knowing. And since man has three prime faculties, reason, will (or impulse to action), and feeling, this criticism must be divided into three main parts: the criticism of

the pure reason, the criticism of the practical reason (desire and will), and the criticism of judgment (having respect to feeling, or pleasure and pain). The first of these, however, contains the regulating principles for both the others, and gives the key to the system. The "Criticism of Pure Reason" was not originally intended to be a system of metaphysics, but rather an inquiry into the possibility of metaphysics; that is, it was critical. As against the sceptic, it was designed to show that there are in the human mind *a priori* or transcendental elements of knowledge, and that these are found even in the perceptions of sense and the laws of the understanding. As against the dogmatist, it was also intended to prove that even this transcendental knowledge does not attain with absolute certainty to the nature of things; it can neither demonstrate nor disprove the reality of objects corresponding to the ideas of reason. ("Transcendental" is used by Kant, not in respect to the objects of knowledge, but to the nature of the knowledge, as *a priori*.) Another, and the strictest mode of stating the question and problem, is this: Are *a priori* synthetical judgments possible? An analytical judgment is one which simply explicates, in respect to any subject, what is contained in its very notion; it reposes on the principle of identity. But such judgments give us no new knowledge. In a synthetical judgment, on the other hand, something is contained or asserted in the predicate, which is not necessarily implied in the subject; and such judgments extend the bounds of our knowledge. All *a posteriori* knowledge is of this character; and the metaphysical question is: Are such synthetical judgments also possible *a priori*? If they are, in any sphere (*e. g.* mathematics), sensualism is refuted; if they are not in the highest sphere (metaphysics), dogmatism is refuted. In conducting this inquiry Kant divides the human mind into the three functions of sense, understanding, and reason, and subjects each to a careful criticism. The general scheme, as carried out, is:

- I. Doctrine of the transcendental elements of knowledge.
  - A. Transcendental aesthetics (*i. e.* perceptions of sense).
  - B. Transcendental logic.
    - a. Transcendental analytics (the understanding).
    - b. Transcendental dialectics (reason, metaphysics).
- II. The transcendental method.

1. *The transcendental Aesthetics*, or the transcendental knowledge involved in the perceptions of sense. In all knowledge there are two elements, the matter and the form. The one is given by experience, the other by the mind. Sensations without ideas are blind; ideas without sensations are empty. The dogmatist ignores the former, the materialist the latter. What is given us in sensation is ordered or arranged by the mind under the two ideas of space and time, which ideas are not the product but the regulators of the sensations. That is, even in respect to the objects of sense, we find the *a priori* ideas of space and time controlling them; and this knowledge too gives us the possibility of a science, *viz.*, mathematics. But yet

this space and time are not forms of the objects of sensation, but the subjective framework in which we put and must put all our sensations. We cannot, then, attain objectively to the knowledge of things as they are in themselves (*Dinge an sich*), because those forms by which we know them are subjective. This denial of the objective validity of space and time is the starting point in the negative results of the "Criticism of the Pure Reason." In the first edition Kant threw out an intimation, withdrawn in the second, that the subject (*ego*) and things-in-themselves are possibly one and the same substance; this led to the subjective idealism of Fichte. 2. *Transcendental Analytics*. We pass here from the sense to the understanding, or the power of forming general notions. It is by such notions that we combine and connect what is given in experience. So that the fundamental question here is this: Is a pure science of nature possible? Here, too, as in the sense, are certain *a priori* principles, which Kant called categories of the understanding (applying Aristotle's term in a different sense). These categories, which he brought into connection with (or rather transferred and transformed from) the purely logical categories, are as follows:

	Logical.	Transcendental.
I. Quantity.	{ Universal. Particular. Singular.	Unity. Plurality. Totality.
II. Quality.	{ Affirmative. Negative. Indefinite.	Reality. Negation. Limitation.
III. Relation.	{ Categorical. Hypothetical. Disjunctive.	Substance. Cause. Reciprocity.
IV. Modality.	{ Problematical. Assertory. Apodictic.	Possibility. Necessity. Existence.

Under these 12 categories, or *a priori* notions of the understanding, we are compelled to bring all our sensible experience. Empty in themselves, they are filled up by phenomena; and they reduce the "rhapsody" of phenomena into order. But what warrants us in pursuing this process—in bringing together such different things as the obscure experience of sensible phenomena and the clear dicta of the understanding? We derive this warrant, says Kant, from the pure intuitions of space and time, in which there is an element common to both. All objective phenomena, and all subjective notions, equally fall under the dominion of these two intuitions, which thus become the *schemata* by and through which the mind interprets nature. Thus, the world does not give laws to the mind, but the mind rules the world. We cannot even know the external world excepting by and through these *a priori* conceptions (*e. g.* substance and time). But at the same time, Kant holds with equal tenacity to the position, that these judgments of the understanding do not, and cannot, disclose to us the supersensible world; we cannot through them come to the knowledge of things as they are in themselves. He does not deny their real objective being, but says that all we can know about them is through

our subjective notions. He even attributes to them activity and efficiency; they force the mind to distinguish and divide; but still, these objects and what the mind says about them are totally diverse. (This is one of the chief points in which subsequent criticism and speculation have modified the position of the Kantian theory of knowledge, making a more close and vital correspondence between the laws of thought and being in order to avoid the irresistible negative results of this theory.) The general result then of the analytics, as of the aesthetics, is, that what is not in time and space cannot be known by or through the categories; that is, it leads to that form of transcendental idealism, which maintains that things-in-themselves cannot be known, that only phenomena are known (*i. e.* known through and by the categories). At the same time Kant is careful to assert that these things-in-themselves have a real existence; and he distinguishes clearly between his system and the idealism of Berkeley on the one hand and that of Leibnitz on the other. Berkeley asserted that we have a knowledge merely of "ideas;" Kant asserts that we have not merely ideas, but ideas of something which is real and independent. Berkeley said that ideas were connected empirically; Kant says, by a necessity, by law (and hence there can be a science of nature). Kant made, as Berkeley did not, a thorough distinction between the *noumena* and the phenomena. 8. *Transcendental Dialectics.* Here we enter upon the proper criticism of the pure or theoretical reason; and here come up the real metaphysical questions. The understanding gives us general notions; the reason, ideas. The three grand ideas with which metaphysics has to do are those of the soul, of the world, and of God, which respectively form the basis of the three sciences, rational psychology, rational cosmology, and theology. By an unnatural method, Kant makes these three ideas correspond respectively with the categorical, hypothetical, and disjunctive syllogisms. He takes a similar course, as we have seen, with the categories of the understanding. The question of the identity of logic and metaphysics is inevitably suggested. The general conclusion of this part of the system is, that these sciences, in the sense of the older dogmatism, are impracticable to reason; but there is still for man a supersensible sphere to be reached and explored in other ways. In respect to rational psychology, it is the aim of Kant to show that we are not warranted in transferring to the soul, as an objective and immortal existence, those predicates which we apply to it as a matter of subjective consciousness; or, that the abstract demonstration of immortality, from the nature of the soul, involves paralogisms. Rational cosmology (or the sum total of the phenomena of the world, reduced to unity) leaves us in kindred contradiction as to the external world. On purely rational grounds (applying the four categories), we land in absolute antinomies, or contradictions: 1, as to quantity, we can equally prove that the world

is limited and unlimited; 2, as to quality, that its elements are both simple and infinitely divisible; 3, as to relation, that it is caused by a free act, or by an infinite series of mechanical causes; 4, as to modality, that it has an independent cause, and that its parts are only mutually dependent. These antinomies, as thus developed by Kant, bring out distinctly the contrast between the infinite and the finite, between the absolute and the relative. The force of them consists in viewing the world, on the one hand, as related to the infinite and absolute; on the other hand, as related to the finite and relative. Kant's solution of them is found in his position, that the categories have subjective but not objective validity. But the antinomy in each case results from applying to one and the same subject (*viz.*, the world) at the same time both infinite and finite properties, making it both absolute and relative, which of course involves us in contradictions. These antinomies show us that reason is weak in constructing the relation between the infinite and finite, between the absolute and relative; but not that reason may not know the real being of both. In the same manner, in his "Rational Theology," the various proofs of the being of God are discussed, and shown to be invalid, *viz.*, the ontological, the cosmological, and the physico-theological. The ontological argument confounds an analytic with a synthetic judgment; the cosmological is only another form of the ontological; and the physico-theological does not prove the perfection or infinitude of the Deity. Thus on grounds of pure reason, in relation to our highest ideas, we are left in the position of being unable to demonstrate their objective validity. Yet still they are "postulates," "necessary illusions;" we are obliged to take them as "regulative" principles. We cannot prove them; nor yet can the materialist or sceptic disprove them; that is, theoretically, we can neither admit nor deny them. This criticism does not lead, he claims, to scepticism; it only shows us the bounds of reason; in fact, it carries us over into that sphere where reason has an authentic and decisive voice, that is, the sphere of the practical reason, the sphere of final causes or ends. Thus may be solved, for practical purposes, the problems which to the pure reason are simply insoluble. The methodology, which forms the second chief part of this "Criticism of the Pure Reason," gives the rule by which reason may and ought to be guided, so that it shall not, for example, apply mathematics to incongruous subjects, nor confound the theoretical and the practical.—In the second of Kant's criticisms, that of the "Practical Reason," the unsolved problems are taken up under a different and positive point of view. His works on the "Metaphysics of Morals," and the "Metaphysical Elements of Law and of Virtue," are devoted to the same general theme. His general position is this: theoretical or pure reason gives us certain postulates, which on merely theoretical grounds cannot be proved to have a

valid being; or, in other words, it gives certain problems as to the soul and its immortality, as to the unity of the cosmos, and as to the being of God, which it cannot itself resolve. But where theoretical reason is silent, practical reason speaks with authority. The sphere of this practical reason is the will; and here is where reason unfolds its whole power and significance. The practical reason is thus the highest spiritual power in man; it has the "primacy" over all the others, even over the pure reason. This practical reason or will now acts, and must act, according to certain laws or principles. Some of these principles are merely subjective, or "maxims;" others have an imperative character or universal validity. These make the "categorical imperative," which is the decisive word in Kant's ethical theory. The moral law is such a categorical imperative; and this is a dictate of reason itself; the so called moral sense is not the source, but the product, of this superior moral law. The formula of this moral law is: "Act only on such a maxim as may also be a universal law;" or, "Act in reference to rational beings (thyself and others) as if they were ends in and for themselves, and not as if they were mere means to an end." If, now, we know and are under such an absolute law, then we must be free; such a law is possible for us only as we are free in the strictest or transcendental sense. This is the "autonomy" of the will; it is a law unto itself; what I ought to do I must be able to do. If the moral law be real, freedom must be real; and that freedom which the pure reason left as a problem is thus proved to be a reality. Still further: if there be such a moral law, there must be a moral world, and in that world the highest good must be brought about by means of the moral law. But as a matter of fact, we find that each individual is still imperfect, under the dominion of sense; that virtue is never fully realized here. But it ought to be, it must be realized; and this realization can only be effected in an endless duration of the soul; the soul, then, must be immortal. Yet again, perfect happiness is essential to the highest good; but this happiness can only be realized when nature and morality are in entire harmony and unison. As a matter of fact they are not so; but yet they ought to be, and they must be. There must then be some power above both nature and moral agents, to connect the two together, to make virtue and happiness coincide. That is, there must be a God. Whatever may be thought of the validity of these arguments, the results contributed to give currency to the Kantian system among those who were repelled by the negative character of the deductions on the grounds of pure reason. A basis seemed to be laid for a practical and living faith in God, freedom, and immortality. The moral element attained such supremacy as in no antecedent system. At the same time, it may well be doubted whether, on strictly philosophical grounds, such a wide separation can

be drawn between the theoretical and practical reason. What Kant calls practical reason sometimes seems to mean reason and sometimes seems to mean will. And what ground is there, after all, for assigning a higher objective validity to the categorical imperative, than to the equally imperative and necessary ideas of the pure reason? If the former may be objective, why not the latter? If the former are necessary postulates in action, the latter are no less necessary in thought; and is action higher than thought? And beside, the introduction of happiness, as equally necessary with virtue, seems like a logical inconsequence in the system; and to make the whole proof of the divine existence rest upon the need of a harmony between virtue and happiness is certainly a restricted view, for a deity is just as necessary to harmonize and combine and unify the material and the spiritual creation in all their parts and relations.—But we must pass to another work of Kant's to see the use which he makes of these positions in relation to the highest objects of belief; that is, his "Religion within the Bounds of Mere Reason." Morality leads to religion. The three "Criticisms" of Kant all end with the idea of God. But religion as given in history contains elements which cannot be directly deduced from ethics. How much, now, of revelation (which he grants to be possible) can be confirmed by reason? 1. There is a "radical evil" in human nature; and this is not physical, but moral. This precedes all actual sin. How can this be explained? All sin must be one's own act; and yet this moral evil is before act. The difficulty can be solved only by assuming a "timeless and intelligible act." This is the inborn, radical, yet still self-produced and guilty corruption of man. (Here is the basis for the subsequent speculations of Schelling on freedom, and of Julius Müller and others on the origin of sin.) As there is this evil in us, so, in order to virtue, there must also be "a total revolution," which "may be called a new birth or a new creation;" though that this must strictly be of grace cannot be shown. 2. A reconciliation of man with God can be effected only through such a change of heart; this reconciliation is symbolized in the person and work of Christ. In Scripture, Christ represents the agony of repentance; to put on Christ is equivalent to the new life; justification means that God accepts this change of heart in view of its future fruits. 3. The victory of the good over the evil principle is seen in the kingdom of God; in the church as a visible institution. This church has the four characteristics of unity, purity, freedom, and immutability. The positive rites of this church are valuable as aids to human weakness. But in the progress of the race the faith of the church will be supplanted by a purely rational faith. The essence of the Christian revelation is found in its moral precepts; all else has only a partial and transient worth. The mysteries of religion are valuable

so far as they help the life; but they make no real addition to knowledge. The Trinity means that God should be worshipped in view of his threefold moral qualities, holiness, goodness, and justice, which are specifically different from each other. Thus, in this allegorizing method, Christianity as a rational religion is reduced to a mere theory of morals. Kant first began that construction of the truths of religion which in the later transcendentalism produced so many philosophies of religion of a much more comprehensive character. Schleiermacher disentangled the proper religious from the merely moral element; and Hegel, even in the mysteries of Christianity, found the same truths in the form of faith which his speculative system expounded in the form of philosophy.—In the third of Kant's "Criticisms," that on the "Power of Judgment," he attempts an investigation of the feelings, corresponding to that of the reason in his "Criticism of Pure Reason," and to that of the desires (or will) in the "Practical Reason." Here, too, he advances beyond the limits of transcendental idealism, and hence this treatise became a starting point for subsequent explorers. The object of the work is to span the chasm between metaphysics (theoretical reason) and ethics (practical reason). Just as feeling (or pleasure and pain) stands between, mediates between reason and the will, so the faculty of judgment, which relates to the feelings, is to mediate between the theoretical and practical reason. This reconciliation is effected by means of the idea of a final cause or design. This idea is found equally in the two spheres subjected to the faculty of judgment, viz.: that of aesthetics, and that of teleology, or final causes in nature. 1. *Aesthetics* has to do with the beautiful and the sublime. The beautiful has no real existence in nature; it is the harmony between the imagination and the understanding. The sublime is an attempt to lay hold of the vast in nature; it does not exist in nature, but in the soul, struggling toward the infinite. The highest aspect of aesthetics is as a symbol of moral good. 2. *Teleology*. The objects of nature are all shaped for some design or end. Such instances of design are of two kinds, external and internal. Mere external adaptations might be the result of mechanism; not so the adaptations or designs which we find in organized beings. Here all the parts are both means and ends; no mechanical law, but only a rational designer, can explain this. Nature cannot be understood excepting on this principle. By this principle of a design immanent in nature, Kant passed the boundaries of a merely subjective idealism, to which other parts of his system were always tending. Fichte developed it on the subjective side; Schelling restored nature, or the objective, to its rights. The latter (*Phil. Schriften*, i. s. 114) says that "there were perhaps never so many deep thoughts compressed in so few leaves as in §76 of the 'Criticism of the Judgment.'"—Beside his larger works and essays,

Kant also wrote many minor treatises, sufficient to have made a literary reputation for most men. In 1784 he published an essay entitled "Ideas about Universal History in a Cosmopolitan Point of View;" and in 1795 a "Project of Perpetual Peace." A severe review in 1785 of Herder's "Philosophy of History," called out the *Metakritik* of that philosopher; Herder was too cautious, courtly, and vague to suit the views of the rigid moralist and metaphysician. The end of the history of the world, according to Kant, is the formation of the most perfect state constitution. Man, though free, is still bound to nature, and exists as a race. Every generation is a means of educating and developing the next generation; and man in the use of his freedom makes the powers of nature subservient to humanity. Perpetual peace among the nations can be insured only by a federation of free states. Publicity is necessary to political life, and the highest good and progress of the state. The human race, as a whole, he contends, is in a constant progress to a better state. In later times this is proved by the general sympathy in the French revolution. (This is contained in his work on the "Strife of the Faculties.") Morals will penetrate more and more into political life, and shape the destiny of the race.—This rapid and condensed outline of the works of Immanuel Kant, though necessarily imperfect, may be sufficient to show the comprehensiveness and subtlety with which he penetrated into the most abstruse regions of thought. The influence of his speculations began to be felt at the same time that the French revolution was changing the face of Europe, and when old chaos seemed to have again revisited the earth. Materialism was predominant in France; in Scotland, Reid was combating scepticism on the principles of common sense; and an abstract dogmatism ruled the German mind. Here was a philosopher who, with unmatched analytic and synthetic powers, came forward to show to each previous and prevalent system its metes and bounds. Against the materialist and the sceptic, he proved that the mind had its *a priori* principles of knowledge; against the dogmatist, he maintained that the sphere of the supersensible, though a reality, is not disclosed to positive thought. He proved that empiricism is right so far as it asserts that the matter of our ideas is drawn from without, but wrong so far as it implies that their form can also there be found. And he is allied with the principle of the common sense philosophy in ascribing an absolute validity to those moral ideas by which life is and must be guided. The utterances of this practical reason are true and valid, whatever may be the difficulties of the theoretical reason. We must live and act in view of God, freedom, and immortality. His philosophy became the starting point for the most remarkable development of speculation since the days of the Greeks. German speculation was thoroughly quickened. Those that opposed Kant and those that espoused his views

equally acknowledged his greatness. Reinhold at first defended, and then modified his system. Schulze, Beck, and Bardili tried to bring it into more popular forms. Krug wrote a new "Organon," and Fries a new "Criticism of the Reason." Hamann, Herder, and Jacobi developed their systems, which made faith the basis of philosophy, with constant reference to the principles of Kant. Herbart's positive philosophy claimed to have the true key to the Kantian metaphysics. Fichte unfolded his subjective idealism as the only logical result of the critical philosophy. And even in some of the latest products of German speculation there are not wanting attempts to show that Kant has not been superseded by any of his successors.—As a teacher of philosophy in the university, the object of Kant was, as he himself declares, not so much to give a system as to habituate his pupils to self-reflection. The teacher should not give thoughts, but lead to thought; he should not carry, but guide, his hearers; and hence the profounder parts of his system were rarely expounded to his classes. He was very simple in his whole style of lecturing. His voice was feeble, and only gradually rose with his subject. A few notes on bits of paper, or text books marked in the margin, were his materials. He always began on a subject as if thinking it out for himself; announced his topic, gave provisional explanations, illustrated it in a great variety of aspects, and thus led his hearers along with him. He despised all the arts of the rhetorician. In developing his ethical theory he often rose to the highest degree of moral earnestness, speaking to the soul against all selfishness and in favor of liberty; and then he seemed, says one of his hearers, "as if inspired by a divine flame." To aid his thoughts he would fix his attention closely on some one auditor, and judge by him whether he was understood. Once a button on a student's coat, which he had made his fixed point of vision, being lost, disconcerted the philosopher and interrupted the lecture. A tower on which he used to gaze in his reveries at home having become hidden by the growth of trees, he could not rest until the foliage was cut away. He was always kind to the students, but, from principle, would not remit their fees, lest they might lose their sense of independence. Tempting offers were made to him to quit Königsberg (a double salary at Halle in 1778 by his friend the minister Von Zedlitz), but he did not care for the money, and disliked all change. In fact, he never went more than 40 miles from his native city. In his person he was slightly built, not much over 5 feet in height; his chest was hollow, and his right shoulder, like that of Schleiermacher, projected much above the other. His features were fine and delicate; his complexion was light; his blue eyes expressed animation and kindness; a high and broad forehead indicated his thoughtful and speculative turn; and the lower part of the countenance showed a tenacious vitality.—The external life of the philosopher, who was

thus probing the depths of human consciousness, was one of the utmost regularity and simplicity. The "sage of Königsberg" pursued his daily avocations in as fixed a routine as that of the humblest artisan or workman. In fact, it almost seems as if his definite theory of morals shaped his whole career. He was never married; metaphysics was the passion of his soul. Summer and winter he rose at 5 o'clock in the morning, not once failing to do so for 80 years. Two hours were spent in study, and two in lectures; and then he studied and wrote till his early dinner at one o'clock. This meal was the great event of the day; and he ate it leisurely, almost always in the society of friends. After dinner he would walk for an hour or two, spend the evening in society or lighter reading, revise his lectures for the next day, and be in bed before 10 o'clock. In general society in his earlier life he was sometimes odd, but also genial and animated. He was a capital listener, and dexterous in drawing out the knowledge of others; but he could tell a good story, and commented on all matters of literary, philosophical, or political interest, with freedom and thoughtfulness. Often a curt phrase, a satirical remark, or a rally of wit would prevent or close a long discussion. In general literature his reading was very large; the English and French classics were familiar to him; and of all writers perhaps he was most fond of Rousseau, whose portrait was the only one that adorned his plain mansion. Of poetry he was never enamored, though a great admirer of Milton's "Paradise Lost." In the history of philosophy he was less versed than in many other parts of literature; considering, in fact, dogmatism, scepticism, and his own system to contain about all that could be well said on speculative matters. Kant was warmly enlisted in all that concerned the general interests of humanity and of justice. In his political views he sympathized with the most thoughtful spirits of the age. "Liberty, law, and public power are the elements of all social life. Law and liberty without power are anarchy; law and force without liberty make a despotism; force alone is barbarism; liberty and law, joined with force, make the republic; the only good civil constitution, which is not necessarily a democracy." He was opposed to involuntary servitude, and to a hereditary nobility. Man, he says, is born free. His great political idea was that there must be a separation of the powers in the state in order to a true social order. Princes he held to be for the people, and not the people for princes. He was also a zealous advocate of the freedom of opinion and the freedom of the press. "Liberty of thought is nothing without the liberty of speech and of writing. . . . To take away the power of freely expressing opinions is to deprive us of the only remedy for the evils which afflict humanity. . . . The prohibition of books of science and of pure theory is an offence against mankind." In his religious views, the feeling of pure obligation, of an inexorable duty, was paramount; in

fact, the sense of duty was so strong as to leave little room for the religious sentiments. His ethical theory made obligation supreme, and left to the affections a subordinate place. His moral formulas are abstract; love was not to him the chief of the virtues. He was the stoic of the 18th century. His general theory of religion, too, was abstract; nor did the positive truths of Christianity as a redemptive system modify either his metaphysical or ethical theories. He gave to German rationalism a strong impulse, in making the merely moral element supreme. So far as he could, he modelled his own life upon the principles of a rigid code of ethics. He abhorred all deceit and lying; he was upright and honest in the minutest matters; every day, every hour had its appointed work. "Whoever will tell me a good action left undone, him will I thank, though it be in the last hour of life." And in the last hour of his life he could say: "My friends, I do not fear death; I assure you before God, that if I was sure of being called away this night, I could raise my hands to heaven, and say, God be praised!" No one who has lived long in the world, he used to say, would be willing on any account to begin and live his life over again. He was benevolent from principle, often giving away nearly as much as the sum required by his own frugal household. Strict economy enabled him to lay up enough for a comfortable old age. Though a warm friend, he did not like to visit those who were sick, nor to talk about the dead. He was most careful of his own life and health; by rigid rules he kept his frail body in tolerable health, never having had a severe illness till worn out by advanced age. In 1802 his powers began to fail rapidly, and he permitted a physician to be summoned. He had frequent falling fits; his sight gradually became dim; his conversation was often incoherent. A few days before his death, he thanked his medical adviser, adding: "I have not yet lost my feeling for humanity."—The best editions of Kant's works are the two most recently published, viz.: that of Hartenstein (10 vols., Leipsic, 1838-'39), and that of Schubert and Rosenkranz (11 vols., Leipsic, 1840-'42). The latter contains a full biography by Schubert, and a "History of the Kantian Philosophy" by Rosenkranz. His life was written in 1804 by Borowsky, and by Jachmann in letters; his last years were described by Wasiansky (1804). G. S. A. Mellin, in 1797, published an "Encyclopædic Dictionary of the Kantian Philosophy," in 6 vols. His philosophy was introduced into Holland in 1792, by Paulus von Hemert; and there elucidated by Von Bosch in 1798, and Kirker in 1800. Schmid and Phiselderk published an exposition of it at Copenhagen, 1796-'98. It was also taught in Hungary and Poland. In Italy it was criticized by Galuppi in 1819, and later by both Rosmini and Gioberti. Charles Villers published a valuable essay on it in French, in 1801; and J. Höhne another treatise in 1802. Destutt de Tracy commented on his metaphysics before the academy; Degerando

in his "Comparative History" (1804), and Mme. de Staël, in her "Germany" (1818), gave a fuller account of it. Schön's "Transcendental Philosophy" was published in 1831. Cousin in 1842 devoted to it a course of lectures (translated by Henderson into English, 1854), and Barchou de Penhoen wrote a "History of German Philosophy" (1836). The best French account is in J. Willm's "History of German Philosophy" (4 vols., 1847), a work crowned by the French academy; the first volume and half of the second are taken up with the critical philosophy. Charles de Rémusat, in 1847, wrote a valuable report on this "History" for the academy of moral and political sciences. Beside the historical accounts, J. Tissot has translated into French the "Pure Reason" (2d ed. 1845); "Logic" (1840); "Metaphysics of Law" (2d ed. 1853), and "of Morals" (3d ed. 1854); the "Metaphysics," edited by Pöhlitz (1848); and "Anthropology" (1854). Trullard in 1841 gave a French version of "Religion within the Bounds of Reason"; Barni in 1846 of the "Criticism of the Judgment," and in 1848 of that of the "Practical Reason," beside a critical examination of these works (1850 and 1851), and the "Metaphysical Elements of Law," with the "Project on Perpetual Peace" (1855). Born published in Latin *Kantii Opera* (8 vols., Leipsic, 1796); Kunhardt, a Latin version of the "Prolegomena to every future System of Metaphysics" (Helmstädt, 1797); and G. L. König, *Elementa Ethica* (Gotha, 1800). The first English work on Kant was a "General and Introductory View," by Nitzsch (London, 1796.) Others are: James Sig. Beck (translated by an auditor), "Principles of the Critical Philosophy" (London, 1798); Willich's "Elements of the Critical Philosophy" (London, 1798); "Kant's Essays and Treatises" (2 vols., 1798); Wirgman's "Principles of the Kantian Philosophy" (1824); J. W. Semple, "Kant's Metaphysics of Ethics" (1837); John Richardson, "Metaphysical Works of Kant" ("Logic," "Prolegomena to Metaphysics," "Proofs of God's Existence," and "Theodicy," 8vo., London, 1836; printed in 1819); an "Analysis of Kant's Critick of Pure Reason," by the translator of that work (8vo., London, 1844; the translation appeared in 1841). Another and better version of the "Critique of the Pure Reason," by M. D. Meiklejohn, was published in Bohn's "Philosophical Library" (1855). An account of his system is given in J. D. Moirell's "Historical and Critical View of the Speculative Philosophy of the Nineteenth Century" (last ed. 1856), with which may be compared Wirgman in the "Encyclopædia Londinensis," and the article in the "Encyclopædia Britannica." The best accounts in German are by Mirbt, Rosenkranz, Michelet (*Geschichte der letzten Systeme*), Ritter (*Geschichte der Philosophie*), and Erdmann (*Geschichte der neueren Philosophie*).

KAOLIN. See CLAY.

KARAJITCH, VUK STEFANOVITCH, a Servian

scholar, born in Trshitch, a village of northern Serbia, in Nov. 1787. He was educated in Carlovitz, in the Austrian Military Frontier, and subsequently visited Vienna, where he devoted himself to literary pursuits, being compelled by a feeble constitution to choose a quiet occupation. Having returned to his native country at the beginning of its struggles for independence under Czerny George, he served as secretary to various national chiefs, most of whom were ignorant of the art of writing, and also as secretary of the national senate at Belgrade. When Serbia was left to the mercy of the sultan by the treaty of Bucharest, Karajitch sought refuge in Austria (1813); and again repairing to Vienna, he was persuaded by another Slavic scholar to collect the beautiful popular songs of the Illyrian tongue, which had been partially made known in Europe by some imitations by Herder, Goethe, and others. He performed a part of his task with zeal and ability, travelling for the purpose in Bosnia and Montenegro, and his collection of *Narodne Srpske pjesme* ("Popular Servian Songs," 4 vols., Vienna, 1814-'88) was hailed with general enthusiasm. They went through numerous translations, including one by "Talvj" (Mrs. Robinson, *Volkslieder der Serben*, Halle, 1825-'6), and by John Bowring ("Servian Popular Poetry," 1827). Continuing his activity, Karajitch published a Servian grammar, which was translated by Jacob Grimm, a Servo-German dictionary, a literary almanac under the title of *Danilica* ("Dawn," 1826-'84), a collection of "Servian Popular Proverbs," and another of "Servian Popular Tales," the last of which was translated by his daughter Wilhelmine Karajitch into German. Among his minor productions is a life of Prince Miloah of Servia, and a work in German, *Montenegro und die Montenegriner*. In his Servian writings, which exercised a great influence among the southern Slavi, Karajitch made use of a system of orthography founded on the Russian alphabet, a fact which has been greatly regretted by the friends of the linguistic system of Gaj, introduced with the object of uniting the various dialects of the Illyrian tongue into one common literary language.

KARAK, a small rocky island in the Persian gulf, in lat. 29° 14' N., long. 50° 20' E., about 15 m. in circumference and 80 m. from Bushire. It affords a safe anchorage, especially during the prevailing N. W. gales. The soil is fertile and the water is good, but there is no timber. The Dutch erected a fort here in the middle of the 18th century, but were soon compelled to evacuate the island. From 1838 to 1841 it was occupied by the English, and again, Dec. 4, 1856, when the expedition against Persia landed on its S. E. coast. Near the fort is a village, which under the Dutch rule contained some 4,000 inhabitants. The population now is about 1,000, including many skilful pilots.

KARAMSIN (properly KARAMZIN), NICOOLAI, a Russian historian, born in a village of eastern Russia in 1766, died in the Tauridan palace near

St. Petersburg, June 8, 1826. He studied in Moscow, served for about 2 years in the imperial guards, travelled in Germany, Switzerland, Italy, France, and England during the first period of the French revolution, and after his return to Moscow in 1792 devoted himself with great zeal to literature. He successively edited the "Moscow Journal," the "Aglais," a "Poetical Almanac," a "Pantheon of Foreign Literature," and a "Pantheon of Russian Literature," and was an active contributor to the "European Messenger." Among his own writings of that period were poems, prose sketches of various kinds, translations from the English, French, and German, a eulogy on Catharine II., and his "Letters of a Russian Traveller" (1797-1801), which were received with great enthusiasm. He exercised a marked influence upon the language and literary taste of his country at that period, and his merits were amply rewarded by the public, as well as by the government. In 1803 Alexander I. appointed him historiographer of Russia. The fruit of his continued and untiring critical research was the "History of Russia" from its earliest period down to the time of the accession of the house of Romanoff, in 12 volumes, the last of which was completed by others after his death. This great product of Russian scholarship, which has been translated into various languages, is generally admired for the mass of its details and descriptive beauties, and by those who read it in the original also for the elaborate elegance of its style; but the uniform elaboration bestowed upon it by the author deprives it of the charms of an artistic whole, and the veil of patriotic embellishment which is thrown over times and scenes of Russian barbarism leaves little room for regretting that the work was interrupted at a point where adulation of the imperial house of his patrons would certainly have led the author to still greater deviations from historical truth. The success of the work, the publication of which occupied the last 10 years of Karamsin's life, was unprecedented in Russia. Alexander appointed him imperial councillor in 1824; and after the sudden death of that czar at Taganrog, in the following year, his successor Nicholas bestowed on him an annual pension of 50,000 rubles, revertible to his widow and children, and put an imperial frigate at his disposal to carry him to Italy for the restoration of his shattered health. Before Karamsin, however, could make use of the latter mark of imperial distinction, death ended his career.—His youngest son, ANDREI, commander of a regiment of hussars, fell in a battle against the Turks near Karakal, in Little Wallachia, May 30, 1854.

KARENS, KARIAINES, KARIANS, or KARRANS, a rude people of Burmah, Siam, and parts of China, supposed to extend from lat. 10° to 28° N. They inhabit the jungles and mountainous districts, and number perhaps 85,000 or 40,000. Those on the frontiers of the British possessions, called Red Karens from the usual color of their dress, are the only portion of the people of

whom we have detailed accounts. They reckon themselves by families, and each family, though it should number 200 or 300 souls, has but one house. Their dwellings are built of stout posts and bamboo, and thatched with palm leaf. The floor consists of a matting of split bamboo, stretched over a strong timber framework which is raised 6 or 7 feet above the ground. The immense edifice is divided into compartments for eating, sleeping, and other purposes, and the inmates are under a regular patriarchal discipline, which is the only form of government recognized by this people. They have always managed to preserve their independence of the Burmese authorities. They are described as industrious husbandmen; they raise hogs and poultry, and hunt game in the forests. A long, loose, sleeveless shirt of coarse cotton is their principal article of dress, but they are fond of ornaments, which they wear on their necks, arms, and ankles. Women among them are treated with respect, and they are said to be hospitable, frank, and more virtuous than their neighbors. The Sgau or Chegaws, and the Pgho or Pgwos, are their principal tribes. These are pagans, but some of the other tribes are Buddhists. There are evidences that at some remote period they received ideas of scriptural history. They have a tradition of white messengers from the sea coming to teach them; they believe in one eternal Supreme Being; and beside the story of the creation and the deluge, they have an account of "the fruit of trial" appointed by God, of which two persons, deceived by the bad spirit, ate, and thereby became subject to age, disease, and death; and of a confusion of languages in consequence of disbelief in God. The labors of American missionaries among the Karens, which were inaugurated in 1828 by Messrs. Boardman and Judson, have been remarkably fruitful. The origin of the Karens is unknown. Some suppose them to be the aborigines of the country which they now inhabit; others, immigrants from India; and others again derive them from the north, which opinion, according to Latham, is the most probable. The same authority calls their language Burmese with notable Singhpo affinities.

**KARNAK.** See **THEBES**.

**KARNES**, a S. E. co. of Texas, drained by San Antonio and Cibolo rivers, and by several smaller streams; area, 1,004 sq. m.; pop. in 1858, 1,865, of whom 291 were slaves. It has a diversified surface, in most places undulating, and thinly timbered. The soil is a fertile sandy loam or black mesquit, and is suitable for Indian corn, wheat, and potatoes. Value of land in 1859, \$211,260. Capital, Helena. The county was formed from Bexar and Goliad in 1858.

**KARPINSKI**, **FRANCISZEK**, a Polish poet, born in the ancient palatinate of Brzesco Litewski about 1760, died at Karpinczyn, in the palatinate of Lublin, Sept. 11, 1828. Being educated in the time of the revival of Polish literature, he early developed a talent for poetry, and found a liberal patron in Stanislas Augustus

Poniatowski, the last king of independent Poland, who presented him with the estate of Karpinczyn. He was also conspicuous in the literary circles of the Ozartoryskis at Pulawy. He wrote various dramatic works and some translations in prose, but his fame rests chiefly on his idyls, and on his poetical translation of the Psalms. His "Works" (*Diela*) have been published in Warsaw, Breslau, and Leipsic.

**KARR**, **JEAN BAPTISTE ALPHONSE**, a French author, born in Munich, Nov. 4, 1808. Upon completing his education he became a teacher in the Bourbon college, Paris, and devoted his leisure to the cultivation of poetry and belles-lettres. He next attached himself to the staff of the satirical journal *Figaro*, and in 1839 published his first prose work, *Sous les tilleuls*, which was originally a metrical romance, founded on an unsuccessful love adventure of his own. It was followed by *Une heure trop tard* (1838), *La Diète* (1834), *Vendredi soir* (1835), *Le chemin le plus court* (1836), &c., the two last being revelations of his private history, a peculiarity more marked in his writings than in those of any of his contemporaries. His publications have appeared at pretty regular intervals down to the present time, that entitled *Voyage autour de mon jardin* (1845), which has been translated into English, being one of the most popular. They are pointedly written, and exhibit invention and a pleasant vein of satire. His labors as a journalist have also been considerable. In 1839, while he was editor in chief of the *Figaro*, he established a monthly magazine of a satirical character entitled *Les guêpes*, the freedom of the literary criticisms in which excited the displeasure of several of his contemporaries, one of whom, an authoress, in revenge made an attempt upon his life in 1844. After the revolution of 1848 he was an unsuccessful candidate for the constituent assembly from the department of Seine-Inférieure. Of late years he has resided in Nice, where he devotes himself chiefly to horticulture, a subject on which he has written extensively.

**KARS**, a fortified city of Turkish Armenia, capital of a pashalic of the same name, situated on a rugged plain, 6,000 to 7,000 feet above the sea, on the river Arpa, or Arpachai, a tributary of the Aras or Araxes, 95 m. N. E. from Erzroum; pop. 12,000. It is defended by ramparts surrounded by a ditch, and has a strong citadel, and some works on the hills N. of the city. It is a place of transit for goods and produce to and from the interior and eastward. It has suffered much from the chances of war. Formerly it contained 6,000 houses, but now has not over half that number. It was taken by the Russian general Paskevitch in 1828, and occupied for two years. In the Russian war of 1854 it was garrisoned by the Turks under the nominal command of Vassif Pasha, really directed by the Hungarian Gen. Kmety (Ismail Pasha) and the British Gen. Williams, and was besieged by a Russian force under Gen. Muravieff. After 2 months' investment the Russians

attempted to carry it by assault. Four times they captured the redoubts, but being dislodged by the bayonet, they retired after 7 hours' fighting, leaving 8,000 dead. On Nov. 29 the place surrendered from famine. Vassif, 8 other pashas, Gen. Williams, and the garrison were made prisoners, the Hungarians having been permitted to retire. At the close of the war the Russians gave up the place in accordance with the treaty of Paris.

KASAN, or KAZAN, an E. government of European Russia, bounded N. and N. E. by Viatka, E. by Orenburg, S. and S. W. by Simbirsk, and W. by Nijni Novgorod; area, 24,000 sq. m.; pop. in 1856, 1,482,085. The surface is generally flat, but in parts undulating and hilly, the S. portion being traversed by branches of the Ural mountains. The principal rivers are the Volga and its affluent the Kama. The forests are very extensive, covering nearly half the surface. The chief trees are the pine, fir, and oak, and the woods abound in bears, wolves, and feathered game. The soil is fertile, and yields large crops of grain, hemp, flax, &c., but is not generally well cultivated. The fisheries are productive, and there are numerous distilleries, tanneries, weaving and spinning establishments, &c. The Russians form nearly one half of the population; the Tartars number about 300,000; the rest of the inhabitants are composed of Tchuvasses of Finnish origin, Tcheremisses, &c. Kasan, with the adjacent governments of Pensa, Simbirsk, Viatka, and Perm, formerly constituted part of the so called Golden Horde, or the Kiptchak khanate, the country having successively been occupied by Finns, Bulgarians, and Tartars. The khanate was for centuries the terror of Russia, and resisted that power until the middle of the 16th century, when it was conquered by Czar Ivan the Terrible, and annexed as a kingdom to Russia. Under Peter the Great it was divided into 5 governments, of which Kasan is one.—KASAN, the capital of the preceding government and of a circle of the same name, situated on the Kasanka about 5 m. above its confluence with the Volga, lat.  $55^{\circ} 47' 26''$  N., long.  $49^{\circ} 21' 9''$  E.; pop. about 60,000. It consists of the fortified town (*Kreml*) and the town proper. It contains over 50 churches, 12 mosques, and several convents, and is renowned for its numerous educational and literary institutions, particularly since the foundation of a university there in 1813. It possesses many important manufactories of cloth, woollen, leather, soap, and iron, and an extensive trade, being the great emporium of the commerce between Russia and Siberia. Near Kasan is the convent of Semiosernoi, with a miracle-working madonna, the patroness of Kasan, which is annually in July brought in procession to the city and exhibited in the Kreml. Kasan was destroyed by fire in 1815 and again in 1842, but it has risen from its ashes more prosperous and better built than ever.

KASCHAU (Hun. *Kassa*), a town of northern Hungary, formerly the capital of Upper

Hungary and of the county of Abauj, now of the united counties of Abauj and Torna, as well as of one of the 5 chief divisions into which Hungary has been divided under Francis Joseph; pop. about 16,000, consisting of Slovaks, Magyars, Germans, and Jews. It is situated on the Hernád, in a beautiful valley enclosed with sloping vineyards, the produce of which, however, is greatly inferior to that of the neighboring region of Hegyalja. It is the seat of a Roman Catholic bishop and of numerous administrative and judicial officers, is one of the best built towns of Hungary, its main street rivalling those of Pesth, has important schools and other institutions, and is the chief commercial link between Pesth and Debreczin on one side and Cracow and Lemberg on the other, with all of which places it will soon be connected by extensive railroad lines, which are now in course of construction. Its manufactures are unimportant. The cathedral of Kaschau, a large structure in old Gothic, is the finest building of the country in that style. Kaschau was surrounded with walls in the latter half of the 13th century, and subsequently played an important part in the wars of Hungary, especially during the period of the struggles of the Protestants against Austria. In the last war two battles were fought before the town, on Dec. 11, 1848, and Jan. 4, 1849, in both of which Count Schlick defeated the Hungarian troops, consisting mostly of undisciplined militia.

KASHGAR, or CASHGAR (Chin. *Kih-shi-ko-urk*), a city of Chinese Tartary, formerly capital of an independent kingdom, 140 m. from Yarkand, situated on a river of its own name, in lat.  $39^{\circ} 25'$  N., long.  $76^{\circ} 45'$  E.; pop. variously estimated from 20,000 to 40,000. The rebellion of 1826-'7 is said to have reduced the population, which was once over 70,000, and impaired the prosperity of the city, which, however, retains its ancient importance as an emporium for the commerce of central Asia, and as the centre of an extensive trade and of many thriving manufactories of carpets, silks, &c. It came into the possession of China by conquest nearly a century ago.

KÄSTNER, ABRAHAM GOTTHELF, a German mathematician and poet, born in Leipsic, Sept. 27, 1719, died in Göttingen, June 20, 1800. He was the son of a professor, embraced in his studies almost all branches of learning, and received an appointment at Leipsic, and eventually at Göttingen, where, in accordance with the reformatory spirit which animated that university in the latter part of the 18th century, he exerted a powerful influence in delivering mathematical and natural sciences from the bondage of antiquated text books. His *Anfangsgründe der Mathematik* (6th ed. 1800), and his various other writings, inaugurated a more enlightened era of scientific study in Germany. He took a conspicuous part in the formation of the celebrated union of Göttingen poets, and by his assistance the elder Boye succeeded in introducing, through the instrumentality of the

*Musenalmanach*, an entirely new generation of poets to the public. His general popularity was chiefly due to his *Sinngedichte*, which show that, although inferior to many contemporary poets in genius, he was the most witty of them all. His colleague, the eminent classical scholar Heyne, pronounced a eulogium on him in 1804, fully recognizing the great services rendered by Kästner to the cause of science and literature. A portion of his epigrammatic poems were included in his "Miscellaneous Writings" (2 vols., 1788). A new edition of the whole of them appeared in 1800, and a new collection of his poetical and prose writings was published in Berlin in 1841.

KASTNER, KARL WILHELM GOTTLIEB, a German naturalist, born in Pomerania, Oct. 31, 1783, died in Erlangen, Bavaria, July 15, 1857. He was professor successively in the universities of Heidelberg, Halle, Bonn, and from 1821 till his death in Erlangen, and contributed much to a diffusion of knowledge of the natural sciences both as a teacher and an author. Chemistry is particularly indebted to him for many valuable works, while he endeavored to place that branch of study upon a more scientific basis; among the principal of them is *Grundsätze der Physik und Chemie* (Bonn, 1820).

KATAHDIN, or KTAADN, the highest mountain in Maine, situated in the central part of the state, about 100 m. N. from Bangor, and 6 m. N. E. from the Penobscot river. It is in a region difficult of access except by the birch canoe of the Indian, the river being the only thoroughfare through this rough territory, and its course being interrupted by frequent shoals and falls. The mountain is composed entirely of granite, which stands in abrupt walls, and is exposed in naked floors covering acres of surface. Down its sides bare spots caused by slides of rock extend from near the summit almost to the base, and present a striking feature in its appearance. The height of the mountain is supposed to exceed 5,000 feet above the level of the sea. Upon its summit are found only lichens and a few dwarfish plants; and half way down, the birch and other forest trees are but of diminutive size. It is remarkable that over the granite rocks, even to the summit, are found boulders of trap and of other rocks not belonging to the mountain, and among them pieces of sandstone containing fossil shells, such as are met with in place many miles further N. From the summit in clear weather the view extends over a country singularly rough and wild, composed of scattered mountains which rise in the conical form of granitic peaks, and among which are interspersed hundreds of lakes, many of large size, and streams without number. Most of these are navigable by the birch canoe, and are made by temporary dams to drift down the pine logs which are cut by the lumbermen in the winter, and hauled down upon the ice in readiness to be floated as this breaks up in the spring.

KATER, HENRY, an English mathematician, born in Bristol, April 16, 1777, died in London,

April 26, 1835. In his youth he spent some time in a lawyer's office, but upon the death of his father in 1794 he procured a commission in a regiment stationed in India, and was for 7 years employed upon the trigonometrical survey of that country. In 1808, while holding the rank of lieutenant, he became a student in the Sandhurst military college; and subsequent to 1814, when he retired on half pay, he occupied himself chiefly with scientific studies. Among his most important discoveries were the determination of the precise length of the seconds pendulum, the investigation of the diminution of terrestrial gravity from the pole to the equator, and his employment of the pendulum for the purpose of finding the minute variations of the force of gravity in different parts of a country, whose substrata consist of materials having different degrees of density. In the "Philosophical Transactions" of 1825-'8 appeared descriptions of his "floating collimator," an instrument of great importance to trigonometers, employed to determine the position of the line of collimation in the telescope attached to an astronomical circle. He also made some ingenious experiments on the relative merits of the Cassegravi and Gregory telescopes, on which, as on many kindred subjects, he furnished interesting papers to the "Philosophical Transactions." He is the author of the greater portion of the "Treatise on Mechanics" by Lardner and Kater, in Dr. Lardner's "Cabinet Cyclopædia," and published "An Account of the Construction and Verification of certain Standards of Linear Measure for the Russian Government" (4to., London, 1832). He was a man of much mechanical as well as intellectual capacity.

KATONA, IERVÁX, a Hungarian historian, born in Pápa, county of Veszprém, Dec. 18, 1732, died Aug. 17, 1811. At the age of 18 he entered the order of Jesuits, after the suppression of which he became professor of sacred eloquence in the college of Tyrnau, subsequently canon of Kalocsa, and eventually abbot of Monostor-on-the-Bodrog. He wrote numerous works on the history of his country, almost all in Latin, the principal of which are: *Historia Critica Primorum Hungaria Ducum*; *Historia Critica Regum Hungaria Stirpis Arpadiana*; *Historia Critica Regum Stirpis Austriacae*; and *Epitome Chronologica Rerum Hungaricarum, Transylvanicarum et Illyricarum*. The publication of the history of Hungary under the house of Austria, which is the most voluminous, was for some time interrupted by prohibition from the government of the emperor Francis, but it was finally brought down to the beginning of the present century.

KATRINE, LOCH, a lake of Perthshire, Scotland, 9½ m. from Callander. It is of serpentine form, about 10 m. in length, and in some places nearly 2 in breadth, and is surrounded with lofty mountains and rocky ravines, displaying scenery of much grandeur and beauty. From its E. extremity flows a stream, which, after passing through the rugged defile of the Trossachs,

widens into the two minor lakes of Achray and Vennachar, and becomes the river Teith, a tributary of the Forth. This lake was formerly a favorite resort of robbers, or *caterans*, and at a little distance from its shore is a small island called Eilan Varnoch, whither the freebooters used to bring their plunder, and which is the famous "Ellen's isle" of Scott's "Lady of the Lake." From this lake the city of Glasgow is supplied with water. The works were begun by the corporation of Glasgow under authority of an act of parliament which received the royal sanction July 2, 1855, and were opened by the queen in person, Oct. 14, 1859. The quantity of water which may be drawn for the supply of the city is equal to 50,000,000 gallons daily. This has to be conveyed over a rugged and mountainous district for a distance of 84 m., in iron pipes, across numerous ravines, and through no fewer than 70 tunnels, the aggregate length of which is 13 m. Each tunnel is 8 feet in diameter, and the longest is 2,650 yards in length. There are several aqueduct bridges, consisting of iron troughs supported by abutments of rubblestone; and between Loch Katrine and the Umsdoch reservoir there are 3 wide and deep valleys across which the water is conveyed in siphon pipes 4 feet in diameter and  $\frac{1}{4}$  of a mile long. The cost of the works, including compensation for land, purchase of the property of former water companies, &c., was about £1,500,000.

KATYDID (*platyphylum concavum*, Harris), an American grasshopper, named from the sound of its note. It is about an inch and a half long, the body being an inch, of a pale green color, with darker wings and wing covers; the thorax is roughened, and is shaped somewhat like a saddle; the wing covers are longer than the wings, and enclose the body in their concavity, meeting above and below like the valves of a pea pod. This "testy little dogmatist," rendered familiar by the verses of Holmes, is one of the loudest and most persevering of our native musicians; silent and concealed among the leaves during the day, at night it mounts to the highest branches of the trees, where the male commences his sonorous call to the noiseless females. The sound is produced by the friction of the taborets in the triangular overlapping portion of each wing cover against each other, and is strengthened by the escape of air from the sacs of the body, reverberating so loudly as to be heard a quarter of a mile in a still night. These insects are now comparatively rare in the Atlantic states, but in some parts of the West their incessant noise is almost insupportable to those unaccustomed to it. The perfect insect lays her eggs in September and October, depositing them in 2 contiguous rows along the surface of a twig previously prepared by her curved piercer; they resemble tiny bivalve shells, of a slate color, about  $\frac{1}{4}$  of an inch long, and are 8 or 9 in each row; the young escape through a cleft in one end; the eggs are sometimes placed in nests in

the earth, where they remain until spring; they are eaten by beetles, ear-wigs, crickets, ants, &c. The young are said to be injurious to roots of grasses and grains; the adults eat the interior of flower buds and the germs of fruit. Though found on almost all trees, the balsam poplar is a special favorite. They are called grasshopper birds by the Indians, who are in the habit of roasting and grinding them into a flour, from which they make cakes, considered by them as delicacies. The katydid is interesting in captivity, and will live thus, if fed on fruit, for several weeks; like other grasshoppers, after the warm season they rapidly become old, the voice ceases, and all soon perish.

KATZBACH, a small river of Prussian Silesia, which joins the Oder on its left bank, 29 m. N. W. from Breslau, after a course of 35 m. It is noted for a victory of the Prussians and Russians under Blücher over the French commanded by Marshal Macdonald, Aug. 26, 1813. (See BLÜCHER.)

KAUFFMANN, MARIA ANGELICA, a Swiss painter, born in Chur, in the Grisons, Oct. 30, 1741, died in Rome, Nov. 5, 1807. In her childhood she evinced a remarkable taste for music and painting, which her father, himself a painter, carefully cultivated. At the age of 15 she was taken to Milan and put under the best masters in either art, and in 1763 accompanied her father to Rome. Her beauty, extraordinary accomplishments, enthusiasm for art, and fascinating manners everywhere excited an interest in her favor. Winckelmann, whose portrait she painted, in a letter written in 1764, speaks in the warmest terms of her many accomplishments, and of her intimate acquaintance with modern languages. While in Rome she painted many portraits of distinguished people. In 1765 she accompanied Lady Wentworth to England, whither her reputation had preceded her, and where she was received with every mark of attention. For 17 years she was the recipient of abundant emoluments, and was welcomed to the most distinguished society of the kingdom. Upon the establishment of the royal academy she was chosen one of the 86 original members. In 1781 she married Signor Antonio Zucchi, an artist, and the following year returned to Rome, where she passed the rest of her life. It is said that some years previous to this she had been betrayed into marriage with a criminal impostor who assumed the title of Count Horn, from whom she procured a divorce. Her artistic merits have been the subject of discussion, and it is generally conceded that her reputation rests chiefly on the charm of her manners and conversation. She painted female heads gracefully, but was deficient in drawing and color, and her composition was often below mediocrity. Many of her works were engraved by Bartolozzi. She retained her maiden name until her death.

KAUFMAN, a N. E. co. of Texas, bounded S. W. by Trinity river, and drained by the E. fork of that stream; area, 950 sq. m.; pop. in 1858, 2,903, of whom 406 were slaves. The

surface is mostly undulating, and the S. E. part is well timbered, while the N. W. is occupied by prairies. The soil is generally good. The productions in 1850 were 30,685 bushels of Indian corn, 2,228 of oats, and 2,954 of sweet potatoes. There were 129 pupils attending public schools. Value of land in 1859, \$466,789. Capital, Kaufman.

KAULBACH, WILHELM VON, a German artist, born at Arolsen, in Waldeck, Oct. 15, 1805. In his youth he showed little inclination for the study of art, until his enthusiasm was awakened by some engravings of Scherzgebürth and by the performance of Schiller's tragedies. Thenceforth he manifested a taste for legendary romance, and tales of the mythical German heroes, such as are current among the peasantry, some of which undoubtedly suggested several of his finest compositions. At the age of 17 he was placed at the Düsseldorf academy, then under the direction of Cornelius, who in 1825 invited him to Munich to assist in the grand series of frescoes he had recently commenced for the king of Bavaria. There he executed the cartoons of Apollo and the Muses on the ceiling of the Odeon, and the allegorical representations of Bavarian rivers and other subjects in the arcades of the Hofgarten. In these he followed very successfully the symbolic, idealized manner of Cornelius, while he succeeded in preserving an individuality of his own. His *Irenhaus*, or "Madhouse," was executed in 1828-'9 from studies taken while he was employed some years previous in painting the chapel of the lunatic asylum at Düsseldorf. The head physician was so pleased with his work that he took him over every part of the establishment, and the impressions which the different aspects of lunacy made upon him were so vivid and terrible that it is said he could only find relief by transferring them to the canvas. This work was engraved by Merz and laid the foundation of his fame. During the next few years he was employed by King Louis in decorating the new palace at Munich, the queen's apartments especially being intrusted to him. For these he painted in encaustic and in fresco designs from the poems of Klopstock, Wieland, and Goethe, beside executing in fresco for the prince Birkenfeld a series of 16 designs illustrating the fable of Cupid and Psyche. About this time he began to give much attention to the works of Hogarth, a portion of whose spirit and manner he seems to have caught in his illustration of Schiller's *Verbrecher aus verlorener Ehre*; while in his illustrations of "Faust," his group of Bedouins, and other works, he showed an increasing tendency to combine the symbolical with the real and a close study of individual character. In 1837 appeared his "Battle of the Huns," a grand and original work suggested by an old legend, in which the spirits of the Huns and Romans who perished under the walls of Rome are described as renewing the combat in the air. This was executed in sepia for Count Raczyński. It was followed the succeeding year by the "Capture

of Jerusalem by the Romans under Titus," the cartoons of which so pleased King Louis that he commissioned the artist to paint the picture in oil. It is a work of immense size—17 feet by 19—and affords a fine example of Kaulbach's imaginative powers, and of the manner of idealizing history at present so popular with German painters. The fulfilment of the prophecies is shown in the planting of the Roman eagle on the high altar of the temple, the lamenting women, and the priests who kill themselves in despair; while the triumph of Christianity is illustrated in the angels conducting the Christians in safety from the scene of terror, and the penalty of the unbelieving in the figure of the wandering Jew pursued by demons. This picture opened to Kaulbach, who had hitherto worked almost exclusively in fresco, a new department in art, and in 1838-'9 he spent several months in the cities of northern Italy studying the oil paintings of the old masters as a preparation for his future labors. In 1845 he received the commission to decorate the vestibule and staircase of the new museum at Berlin with a series of frescoes illustrating striking passages in history. The 1st represents the building of the tower of Babel; the 2d the nations of Greece listening to the songs of Homer; the 3d and 4th are repetitions of his "Battle of the Huns" and "Capture of Jerusalem;" the 5th represents the crusaders entering Jerusalem, and the 6th the conversion of Wittekind to Christianity through the agency of Charlemagne. In addition to these, many allegorical representations of nations, in all the stages of their development, and figures of sages and heroes, fill the surrounding compartments. Above the whole runs a broad band of frieze, which the artist has filled with innumerable figures of boys who enact in their childish sports the history of human life. The whole work has employed him, with his pupils Eohler and Muhr, a large portion of each year since its commencement, and is not yet finished. Of late years he has passed his winters in Munich, and among other works has illustrated the history of art from the period of its revival to the present time in a series of frescoes for the new Pinakothek. A natural tendency in the artist to satire having manifested itself a little too openly, the work was denounced by the painter Julius Schnorr in a pamphlet as unworthy of the artist and a disgrace to the nation. In addition to the important works above mentioned, Kaulbach has found time to execute many other minor designs, and has recently devoted himself chiefly to portraits and oil painting. Among his lesser works may be mentioned his illustrations of Shakespeare and the Evangelists, and particularly of Goethe's *Reineke Fuchs*, the humor of which is not less remarkable than the drawing of the animal figures. Since 1855 he has executed two large pictures for the king of Bavaria, the "Battle of Salamis" and the "Marriage of Alexander and Roxana," and has recently finished in fresco on the walls of the Germanic museum, Nuremberg, a large composition rep-

representing the opening of the tomb of Charlemagne at Aix la Chapelle by Otho the Great, which he has presented to the institution. The greatest and most original of the pupils of Cornelius, he enjoys a celebrity in Germany not inferior to that of his master, and like him is now in the maturity of his fame and powers.

KAUNITZ, WENZEL ANTON, prince, count of Rietberg, an Austrian diplomatist and statesman, born in Vienna in 1711, died June 27, 1794. One of 19 children, he was destined for the church; but after the death of some of his elder brothers, he chose a worldly career, studying at Vienna, Leipsic, and Leyden. He became a chamberlain of the emperor Charles VI., travelled for some years in Germany, Italy, France, and England, and in 1735 was appointed aulic councillor of the empire. By marriage he became the proprietor of the county of Rietberg. His influence rose under the daughter and successor of Charles, Maria Theresa, when, after various and successful diplomatic missions to Rome, Turin, and Brussels, and a short administration of the Austrian Netherlands till their occupation by the French in 1746, he signed for Austria the treaty of Aix la Chapelle (1748). Shortly after he became minister of state, but soon left this position, being sent as ambassador to France, where, by his personal qualities and diplomatic skill, he secured the influence of Mme. de Pompadour for an alliance with Maria Theresa. This was effected in 1756, and the 7 years' war began, after the conclusion of which Kaunitz, who in 1758 had been appointed chancellor, was elevated to the rank of prince of the empire. He accompanied Joseph II. to the interview at Neustadt in Moravia with Frederic the Great, when the two monarchs concerted the scheme of the first partition of Poland, but against the opinion of the minister. Frederic, who had good reasons to be embittered against the able diplomatist, speaks disparagingly of him in his memoirs, though the latter was in his time regarded as the oracle of statesmen; and Joseph, whom he less successfully served in his schemes for the annexation of Bavaria, though supported by his liberal views in internal reforms, gradually withdrew his favor from the old statesman during his actual reign (1780-'90). Kaunitz gained new influence during the short reign of Leopold II., but after the accession of his son Francis (1792) he resigned his offices. A taciturn and scheming diplomatist, Kaunitz was ceremoniously grave with his equals, fond of the French language, literature, and fashions, and with a great deal of frivolity, vanity, and self-love united probity, affability toward inferiors, and fidelity to the interests of the state.

KAVANAGH, JULIA, a British authoress, born in Thurles, co. of Tipperary, Ireland, in 1824. At an early age she accompanied her parents to France, where she was educated. In 1844 she took up her residence in London, and about the same time began to write tales and sketches for the magazines. Encouraged by the success

which these met with, she published in 1847 her first book, a tale for children entitled "The Three Paths." It was followed by "Madeleine" (12mo., 1848), a story of peasant life in France, and in 1850 by a series of interesting historical sketches entitled "Woman in France in the 18th Century" (2 vols. 8vo.). In 1851 appeared her "Nathalie" (3 vols. 8vo.), in which the scene is also laid in France, and which has proved one of her most popular novels. Her remaining works are: "Women of Christianity exemplary for Piety" (8vo., 1852); "Daisy Burns" (3 vols. 8vo., 1853), "Grace Lee" (3 vols. 8vo., 1854), and "Rachel Gray" (3 vols. 8vo., 1855), which describe English society at the present day; "The Hobbies" (3 vols. 8vo., 1857); and "Adèle" (3 vols. 8vo., 1858). Miss Kavanagh resides chiefly in England, but makes occasional visits to France and other parts of the continent.

KAZINCOZY, FERENCZ, a Hungarian author, born in the county of Bihar, Oct. 27, 1759, died in that of Zemplén, Aug. 22, 1831. He commenced his classical studies at the college of Patak at the age of 10, acquiring also a knowledge of various living languages, left that school in 1779, and subsequently studied law at Kaschau. On the recommendation of Count Török he was made inspector of schools, and was soon able to devote himself to literature, which he did with ardor. Like many others, he was inspired to work for the national regeneration of his people by the centralizing and Germanizing tendencies of Joseph II. (1780-'90), but no other was so fully convinced as he of the possibility or usefulness of restoring the then decayed Magyar tongue to its pristine purity, and of developing its resources to an unparalleled richness by means of new words, framed from existing roots and in accordance with the forms and spirit of the language. With Szabó and Bacsányi he edited the "Magyar Museum," and subsequently alone the "Orpheus," both literary magazines published at Kaschau. Having become implicated in the democratic conspiracy of the abbot Martinovics, he was suddenly arrested at the house of his mother in Lower Regmecz, on Dec. 14, 1794, carried to Buda, tried, and condemned to death; but while Martinovics and several of his associates were executed at Buda (1795), the sentence of Kazinczy and some others was commuted to imprisonment "till they had shown signs of sufficient penitence." He was kept in the dungeons of Buda, Bränn, Kufstein, and Munkács, and released in 1801. He married the daughter of his former protector, Count Török, and retired to a country residence in the neighborhood of S. A. Ujhely, which he named Széphalom (Fairhill), and where he spent the remainder of his life, continuing to labor for the literary progress of his country. A protracted lawsuit, however, distracted his latter years, and the savage outbreak of the Slovak peasantry in Zemplén during the prevalence of the cholera in 1831 embittered his last days. His works

which have twice been collected, contain original epistles, epigrams, sketches of travel, a tragedy, &c., beside translations from Goethe, Lessing, Larochevoucauld, Sterne, and others. He also edited the works of Zrinyi the poet, Baróczi, Dajka, and Kis, and a volume of "Hungarian Antiquities and Rarities" on grammatical subjects. In 1859 the centennial birthday of Kazinczy was celebrated throughout Hungary.

KEAN, EDMUND, an English actor, born in London, March 17, 1787 (according to the suggestion of his biographer Mr. Procter, although other accounts make the year 1789 or 1790), died in Richmond, May 15, 1888. His father is supposed to have been Edmund Kean, a person at one time in the employ of the builder of the Royalty theatre; and his mother, whose name he retained during his childhood, was Miss Ann Carey, by profession an actress, and a descendant of Henry Carey the poet. At 2 years of age, his mother having refused to keep him, he was taken in charge by a Miss Tidawell, who put him to school in London. A few years later his mother, who occasionally followed the business of an itinerant vender of perfumery, took him with her in her peregrinations, and was fortunate in bringing him under the notice of a Mrs. Clarke. He had, almost as soon as he could walk, appeared at Drury Lane theatre as Cupid in the opera of "Cymon," and had subsequently taken children's parts on the stage, where he attracted attention by his remarkable beauty and the delicacy and expressiveness of his features. His recitations from Shakespeare and his manners made so favorable an impression upon Mrs. Clarke, that he remained for two years under her protection, and received instructions in dancing, fencing, and various other accomplishments. When about 12 years of age he enrolled himself in Richardson's strolling troop, of which his mother was a member, and on one occasion at Windsor recited in the presence of George III. From the beginning of the century to the period of his first appearance in London in 1814, he was connected with strolling companies or provincial theatres, assuming every variety of character, from the leading parts in tragedy to Harlequin in the pantomime, and by very slow degrees forcing his talents into notice. In 1808 he was married, and during several years experienced many vicissitudes of fortune, being frequently reduced with his family, consisting of his wife and two children, to the verge of starvation. In 1818 Dr. Drury, the master of Harrow school, saw him act at Teignmouth, and was so impressed with his dramatic abilities that he procured him an introduction to the manager of Drury Lane theatre, by whom he was engaged for 8 years at a salary of £8, £9, and £10 per week for each successive year. He made his debut on the London stage, Jan. 26, 1814, as Shylock, before a meagre audience, not particularly predisposed in his favor; but so great was his confidence in his own powers and the vigor of his personation, that at the fall of the curtain he was greeted by

applause such as had not for many years been heard in Drury Lane, his appearance, according to Hazlitt, being "the first gleam of genius breaking athwart the gloom of the stage." After his 8d performance of Shylock, the receipts from which reached an almost unprecedented sum, his articles of engagement were cancelled, and a new engagement at a far higher salary was offered to him; and not long after he received from the committee of Drury Lane theatre a present of £500, beside numerous valuable gifts from private persons. He subsequently appeared as Richard III., Hamlet, Othello, Iago, Macbeth, Sir Giles Overreach, Sir Edward Mortimer, Lear, and in various other characters, with undiminished success, and for several years was by many degrees the most eminent and popular actor on the British stage. In 1820 he made a professional tour in the United States, which at first was attended with great success; but in May, 1821, his refusal to complete an engagement in Boston in consequence of the thinness of the houses, created an excitement which led to his abrupt departure from the city. Upon returning to England, he played his usual round of characters; but after the developments respecting his criminal connection with the wife of Alderman Cox, in the action of Cox *vs.* Kean, Jan. 1825, in which a verdict of £800 damages was pronounced against him, he was hissed from the stage in Edinburgh and London, and never perhaps wholly recovered the public favor. In 1825 he returned to the United States, and was at first received with riot and confusion wherever he attempted to act. Having tendered an apology, he appeared in New York and Philadelphia, but was not permitted to perform in Boston or Baltimore. During this visit he was elected a chief of the Tuscarora Indians by the name of Alantenouidet. Subsequent to his return to England in 1826 his health and spirits, undermined by habits of drinking in which he had indulged almost from boyhood, and by the mortification attending his trial, gave way rapidly, and it was only by the use of stimulants that he could still act his old parts. He was unable to master a new one, forgetting the words almost as soon as he acquired them. In Feb. 1833, he was announced to appear in "Othello" with his son Charles Kean, with whom, after an estrangement of several years, the result of the father's misconduct, he had recently become reconciled. On the night of the performance he succeeded with difficulty in getting through two acts of the play, but in the 3d act, while uttering the words, "Villain, be sure," &c., he fell exhausted into the arms of his son, who acted Iago, and was borne from the stage. This was his last appearance before the public. A short time before his death he became reconciled to his wife, who had been separated from him for 7 years. Kean was short of stature, but well formed and graceful, and his eyes were singularly black and brilliant. His countenance was capable of wonderful variety and intensity of expression, and his action, which, as well as

his conceptions of character, was the result of deep study, lifted him far above the ordinary heroes of the stage. He has been called the first tragedian of his age, and probably in the delineation of passionate, impulsive characters he has not been equalled in modern times. Mr. Procter (Barry Cornwall), in his biography of Kean (2 vols. 8vo., London, 1835), sums up his dramatic qualities as follows: "As a tragedian he was decidedly of the very first order. He possessed vigor, pathos, sarcasm, and the power of communicating terror in the highest degree; and his intensity in expressing all the passions has never been approached within our recollection." The parts mentioned above are those in which he chiefly distinguished himself, although he appeared with success in many others. He was a man of impulse and of genius, and in spite of his excesses and eccentricities possessed redeeming points of character.—CHARLES JOHN, son of the preceding, born in Waterford, Ireland, Jan. 18, 1811. He was educated at Eton, whence he was withdrawn at the age of 16 in consequence of the refusal of his father to maintain him longer at school; the son having incurred his displeasure by declining the offer of a cadetship in India in order to look after the wants of his mother. In this emergency Charles Kean determined to adopt the stage as a profession, and on Oct. 1, 1827, made his debut at Drury Lane theatre in the character of Young Norval. His success was not striking, and for several years he made no impression upon the public, but rather provoked unfavorable comparisons between himself and his father. In 1830 he visited the United States, and after his return to England in 1833 began by degrees to assume the position of a leading actor on the London boards. In 1839 he revisited America, returning to England in the following year, and in 1842 he was married to the accomplished actress Miss Ellen Tree. In 1845 he made a 8d visit to the United States, performing with his wife in the chief cities for upward of two years. For several years after his return he played engagements at the principal theatres in London and the provinces, and in 1851 he became the sole lessee of the Princess's theatre, where for a number of seasons he produced splendid revivals of "Macbeth," "King John," "Richard III.," "Richard II.," the "Tempest," and other Shakespearian plays. As an actor he holds a respectable position, but has inherited only a moderate share of his father's genius. In his capacity of stage manager he has exhibited good taste and abundant resources, and was for several years the director of the theatrical performances at Windsor castle. In 1859 appeared the "Life of Charles Kean," by J. W. Cole (2 vols. 8vo., London).—ELLEN (TREE), wife of the preceding, and an actress of note, born in London in 1806. She first appeared upon the stage at Covent Garden theatre, London, in 1823, and within a few years became one of the leading members of her profession, excelling both in comedy and tragedy, and maintaining on as well as off the

stage a lady-like bearing, and much refinement of manner. In Dec. 1836, she made her debut upon the American stage at New York, and subsequently acted with success in the chief cities of the United States and Canada. In 1842 she was married to Mr. Charles Kean, with whom she has continued to appear down to the present time, sustaining the position of one of the leading actresses in England. Among her most popular characters are Beatrice in "Much Ado about Nothing," Rosalind in "As You Like It," Portia in the "Merchant of Venice," Viola in "Twelfth Night," Julia in the "Hunchback," Mrs. Haller in the "Stranger," &c. Few actresses have so long retained the reputation acquired in early youth, or been more respected in private life.

KEANE, JOHN, first Lord Keane, a British general, born at Belmont, co. Waterford, Ireland, in 1781, died at Burton Lodge, Hampshire, England, Aug. 24, 1844. He entered the British army as ensign in his 18th year, and during the campaign in Egypt acted as aide-de-camp to Lord Cavan. He served in Spain, where he gained the rank of major-general. In the autumn of 1814 he was appointed to command the land forces destined to attack New Orleans, but was superseded by Sir Edward Pakenham, under whom however he continued to serve, and was twice severely wounded. From 1823 to 1830 he was commander-in-chief of the West Indian army, and during a part of that period administered also the civil government of Jamaica. In 1838 he was sent to India, and in 1839 captured the fortress of Ghuznee, in Cabool, till then deemed impregnable. For this exploit he was raised to the peerage as Baron Keane, in Dec. 1839, and received from the East India company a pension of £2,000.

KEARNY, STEPHEN WATTS, an American general, born in Newark, N. J., Aug. 30, 1794, died in St. Louis, Mo., Oct. 31, 1848. He entered the army in 1812 as lieutenant in the 18th infantry, and distinguished himself in the action at Queenstown heights in the same year. He served throughout the war, and upon the declaration of peace was retained in the army as captain in the 2d infantry. In 1838 he became lieutenant-colonel of dragoons, in 1836 colonel, and in June, 1846, a brigadier-general. At the commencement of the Mexican war he commanded the "army of the West," which marched from Bent's fort on the Arkansas westward, and conquered New Mexico. Having established a provisional civil government in Santa Fé, he proceeded to California, and participated with his command in the battle of San Pascual, Dec. 8, where he was twice wounded. He subsequently commanded the sailors and marines and a detachment of dragoons in the battles of San Gabriel and the plains of Mesa, Jan. 8 and 9, 1847. For his services in this campaign he was appointed brevet major-general, his commission being dated from the battle of San Pascual. He was governor of California from March to June, 1847, but subsequently joined

the army in Mexico, where he continued until the close of the war. He died of a disease contracted in Mexico.

KEATS, JOHN, an English poet, born in London, Oct. 29, 1795, died in Rome, Feb. 27, 1821. His father married the daughter of the proprietor of a livery stable, by whom he received sufficient means to afford his children the rudiments of a good education. John at an early age was sent with his brothers George and Thomas to Mr. Clarke's school in Enfield, where he remained until his 15th year. The 8 boys are said to have manifested an unusually belligerent disposition, but John, according to the testimony of one of his schoolfellows, "combined a terrier-like resoluteness with the most noble placability." He could also conceive passionate attachments, and upon the death of his mother hid himself for several days in a nook under the master's desk, utterly inconsolable. He seems to have been careless of the ordinary school distinctions, but read with avidity, though in a desultory manner, whatever authors attracted his fancy. He never advanced in his classical studies beyond Latin, and his knowledge of Greek mythology was derived from Lempriere's dictionary and Tooke's "Pantheon"—a singular fact, considering the thoroughly Hellenic spirit which imbues some of his works. In 1810 he was removed from school, and apprenticed for 5 years to a surgeon in Edmonton, but still continued his intimacy with the family of his preceptor, between whose son, Charles Cowden Clarke, and himself a warm friendship always subsisted. The young men read Spenser together, and Keats, who, Mr. Clarke writes, "ramped through the scenes of the romance like a young horse turned into a spring meadow," felt the first impulse to original composition. His earliest known verses are the lines "In Imitation of Spenser," and the influence of his favorite is discernible in many of his subsequent poems. About the same time he became acquainted with Homer through Chapman's translation, which he read with equal enthusiasm, commemorating his emotions in the noble sonnet, "On first looking into Chapman's Homer." Upon the completion of his apprenticeship he removed to London to "walk the hospitals," and made the acquaintance of Leigh Hunt, Haydon, Hazlitt, Godwin, and other well known literary men, incited by whose praise he published a volume of poems, comprising sonnets, poetical epistles, and other small pieces, which excited little attention. He soon perceived that the profession of a surgeon was unfitted for him, both on account of his extreme nervousness in the performance of operations, and of the state of his health; and in the spring of 1817 he was induced by symptoms of consumption, the hereditary disease of his family, to make a visit to the country. During this absence from professional duties he commenced his "Endymion," which, with some miscellaneous pieces, was published in the following year. Keats had allied himself with a political

and literary coterie obnoxious to the "Quarterly Review" and "Blackwood's Magazine," and the appearance of a volume of poems by a new writer of the "cockney school" was the signal for an attack upon him by these periodicals, the bitterness of which savored more of personal animosity than of critical discernment. The insulting allusions to his profession, his private affairs, and his family, however, aroused in the poet no other feeling than contempt or indignation; and if we may judge from his letters, far from being crushed in spirit by the virulence of his reviewers, as was generally believed, he would have been much more inclined, in accordance with his boyish propensities, to inflict personal chastisement upon them if he had met them. Byron in the 11th canto of "Don Juan," and Shelley in his "Adonais," have apparently confirmed the notion that his sensitive nature on this occasion received a shock from which it never recovered; but it is certain that the effect of the criticism has been greatly exaggerated. His health was failing rapidly, but from other causes than his enemies or his admirers supposed. His younger brother's death in the autumn of 1818 affected him deeply, and about the same time he experienced a passion for a lady of remarkable beauty, the effect of which upon a frame worn by disease was fatal. His little patrimony became exhausted, and he began to think of making literature his profession. While preparing a 3d volume for the press he was attacked with a violent spitting of blood, which his surgical training at once informed him was arterial. After a long illness he recovered sufficiently to think of resuming his literary avocations, but found his mind too unstrung by sickness and the passion which had such an influence over him. In this emergency he had nearly determined to accept the berth of surgeon in an Indian man, when a return of the previous alarming symptoms made it apparent that nothing but a winter in a milder climate would offer a chance of saving his life. Before his departure he published the volume containing his odes on the "Nightingale" and the "Grecian Urn," the poems of "Lamia," "The Eve of St. Agnes," "Isabella," &c., and the magnificent fragment of "Hyperion," of which Byron said it "seems actually inspired by the Titans and as sublime as *Æschylus*." Jeffrey in the "Edinburgh Review" spoke discriminately and kindly of the poet, regretting that his works had not sooner been brought to his notice. In Sept. 1820, Keats left England with Mr. Severn, a young artist and a devoted friend, who never left his bedside. He lingered a few months at Naples and Rome, and died at the latter place after much physical suffering. A few days before his death he said that he "felt the daisies growing over him." He was buried in the Protestant cemetery in Rome, near the spot where Shelley's ashes were afterward interred; and upon his tomb was inscribed the epitaph, dictated by himself: "Here lies one whose name was writ in water." His poems have

been often republished, and at present enjoy a popularity not inferior to that of any of his contemporaries. The best edition is that of Moxon (1 vol. 12mo.), containing a biography of the poet by R. Monckton Milnes. His modest hope that "after his death he would be among the poets of England," has been realized to a far greater extent than he could have anticipated; and his influence can be traced in the poetic development of many later writers.

KEBLE, JOHN, an English divine and poet, born about 1790. He was graduated at Oriel college, Oxford, in 1810. For some years he filled the office of professor of poetry at that institution, but since his appointment to the vicarage of Hursley, in Hampshire, his life has been chiefly passed in the duties of the ministry, and in literary pursuits. He was one of the contributors to the famous "Tracts for the Times" which appeared between 1834 and 1836. He was also one of the editors of the Oxford "Library of the Fathers" (39 vols.). His principal poetical works are: "The Christian Year: Thoughts in Verse for the Sundays and Holidays throughout the Year" (2 vols., Oxford, 1827); "Lyra Innocentium, or Thoughts in Verse on Christian Children;" and "The Psalms of David translated into English Verse."

KEOSKEMÉT, or KESKEMÉT, a Hungarian town on the railway from Pesth to Szegedin, 63 m. from the former city; pop. 86,000. It contains churches for the Roman Catholics, Protestants, and Greeks, a synagogue, and various educational institutions. It has soap manufactories and tanneries, a lively trade in horses and cattle, and 5 annual fairs. It was the largest market town of the whole Austrian empire until 1857, when it was invested with the privileges of a city.—The Keskemét heath is a desolate and sandy region, stretching for about 200 m. through the circles of Pesth and Little Cumania between the Danube and the Theiss. One may ride half a day upon it without meeting a habitation or a tree.

KEENE, the shire town of Cheshire co., N. H., situated on the left bank of Ashuelot river, at the junction of the Cheshire and Connecticut river railroads, 93 m. N. W. from Boston; pop. in 1859 estimated at 5,000. The village is pleasantly situated, is well built, and laid out with great regularity, the principal streets radiating from a central square, on which stands a handsome new court house. The town hall, a high school, and 8 banks are the other principal buildings. There are several excellent district schools, 2 weekly newspaper offices, and 5 churches (Baptist, Calvinistic, Methodist, Roman Catholic, and Unitarian). An active trade is carried on, and the town has several manufacturing establishments, including a woollen mill, a manufactory of various kinds of machinery, and a steam factory of doors, sashes, and blinds, chiefly for the Australian and Californian markets. The first permanent settlement in the town was made in 1753.

KEENER, JOHN CHRISTIAN, D.D., an Amer-

ican Methodist clergyman, born in Baltimore, Md., Feb. 7, 1819. He entered the Wesleyan university, Middletown, Conn., when that institution was opened under Dr. Fisk, and was graduated there in 1834. He was a wholesale druggist in Baltimore till 1840, when he became a preacher. In 1854 he received the degree of D.D. from Lagrange college, Ala. He is the author of "Post Oak Circuit," a book of wit and wisdom on church finances that has had an extensive circulation. He now resides in New Orleans.

KEIGHTLEY, THOMAS, an Irish author, born about 1800. He is a graduate of Dublin university. Having while young lost his fortune, and being excluded by ill health from the learned professions, he went to London to devote himself to literature. In this, as he declares in the preface to a revised edition of his "Fairy Mythology," he was in every respect very successful. The "Fairy Mythology," by which he is most popularly known, was his first work. It was followed by the "Mythology of Ancient Greece and Italy" (2ded., London, 1838), "Tales and Popular Fictions," and "Outlines of History," the last being compiled for Lardner's "Cabinet Cyclopædia." By the advice of Dr. Arnold of Rugby he next undertook a series of compendiums, embracing a "History of England," "History of India," "History of Rome," and "History of Greece." Most of these works have been frequently reprinted, and several have been republished in the United States and translated into foreign languages. A revised edition of the "Fairy Mythology" was published by H. G. Bohn (London, 1850). Mr. Keightley has also written "Scenes and Events of the Crusades."

KEILHAU, BALTHAZAR MATHIAS, a Norwegian geologist, born near Christiania, Nov. 2, 1797, died there, Jan. 1, 1858. He officiated for many years as professor of mineralogy in the university of that city, and, by his explorations, teachings, and writings, contributed much to diffuse a knowledge of the geological formation of Norway. He founded the mineralogical museum in the university of Christiania, and was actively engaged in various public duties until 1856, when declining health compelled him to retire.

KEILL, JOHN, a Scottish mathematician and natural philosopher, born in Edinburgh, Dec. 1, 1671, died in Oxford, Sept. 1, 1721. He was educated at Edinburgh and Oxford, where he delivered private lectures on the Newtonian philosophy. In 1700 he became assistant Sedleian professor of physics at Oxford, and in 1708 was chosen fellow of the royal society of London. In 1709 he was appointed treasurer to the Palatines, German emigrants whom the government was sending to New England, and whom he accompanied thither. On his return in 1710, he succeeded Mr. Cuswell as Savilian professor of astronomy at Oxford. In 1711 he was appointed by Queen Anne decipherer of state papers. He was a fierce assailant of Dr. Burnet, Leibnitz, and the other opponents of the Newtonian theories. He was the author of many learned

works, the most important of which are: *Introductio ad Veram Physicam* (1701), and *Introductio ad Veram Astronomiam* (1718). The best edition of his works is that of Milan (1742).

KEITH (GEORGE KEITH-ELPHINSTONE), Viscount, a British admiral, born at Elphinstone, East Lothian, Scotland, Jan. 12, 1746, died at his seat in Tulliallan, Perthshire, March 10, 1828. He was the youngest son of the 10th Baron Elphinstone, and entered the navy in his 15th year. In 1775 he received the commission of post-captain, and soon after, in command of the frigate *Perseus*, was employed on the American station, participating in the British attack on Bunker hill, and in the capture of Fort Mifflin in the Delaware, Nov. 15, 1777. In 1798 he served under Lord Hood at the reduction of Toulon, and in 1795, as rear admiral of the white, took possession of Cape Town, and subsequently conquered Ceylon, Cochin, Malacca, and the Moluccas. He completed his services in the East by capturing, in Aug. 1796, off Saldanha bay, a Dutch squadron, which had been despatched for the recovery of the Cape Colony. Upon his return to England in 1797 he was created an Irish peer as Baron Keith of Stonehaven Marischal. In 1799 he took command of the fleet in the Mediterranean, and in March, 1800, blockaded Genoa, then occupied by a French army under Masséna, until its surrender to the Austrians. He subsequently co-operated with Abercrombie in the military operations in Egypt. He continued in active service until after the battle of Waterloo, and for several years held command of the channel fleet as admiral of the white. It was owing to his disposition of his cruisers along the coast of France that Napoleon was induced to surrender himself a prisoner. In 1814 he was created Viscount Keith of the United Kingdom, having since 1801 been a baron of like name. Previous to his elevation to the peerage he was on several occasions a member of the house of commons. His 2d wife, born in 1762, died March 31, 1857, was the eldest daughter and co-heir of Henry Thrale, the friend of Dr. Johnson, from whom she received her education. He left no sons, but his baronial honors have descended to his elder daughter by his first wife, the present Baroness Keith, wife of Count Flahaut. (See FLAHAUT DE LA BILLARDERIE.)

KELAT. I. The capital city of Beloochistan, and of a province of its own name, situated on the declivity of a hill called Shah Mirdan, about 6,000 feet above the sea, in lat. 29° 8' N., long. 65° 45' E.; pop. about 12,000. It is surrounded by an earth wall 18 feet high, flanked with bastions. In the vicinity is a district that produces large quantities of fruit. A number of Afghan merchants reside at Kelat, and carry on a considerable trade with Sindh, Bombay, and Candahar. The chief manufactures are muskets, swords, and spears. Kelat was captured by the British in 1839, and again in 1840, and was retained by them until 1841. II. A valley of Persia, in the province

of Khorassan, extending E. and W. about 60 m., and N. and S. about 15 m.; pop. 8,000. It is surrounded by steep mountains, whose precipitous sides are scarped externally, and have a mural appearance, while internally care has been taken to add to their natural inaccessibility, and to make descent into or escape from the valley equally impracticable. At a little distance from the principal range of hills is a lesser range, and intervening between the two a deep ravine which serves the purpose of a ditch. There are two entrances to the valley, one at the E. and one at the W. extremity, which are narrow and intricate, and have been so fortified as to be impregnable. They are denominated the "gates of Kelat," and over each gate is a tower, where sentinels are continually posted. The valley is highly cultivated. The khan of Kelat is an independent chieftain, and has at his command a standing force of 1,000 horse and 2,000 foot.

KELLERMANN, FRANÇOIS CHRISTOPHE, duke of Valmy, a French soldier, born in Strasbourg, May 30, 1735, died in Paris, Sept. 12, 1820. Enlisting as a private in 1752, he served during the 7 years' war and obtained the rank of captain. In 1771 he was among the French officers sent to Poland to assist the confederates of Bar, and fought bravely at the battle of Oracow. In 1785 he had reached the rank of brigadier-general. On the breaking out of the revolution he espoused the popular cause, and in 1791 was appointed to the command of the army in Alsace. He succeeded in keeping the Austrians from that province and Lorraine; and in 1792, having joined Dumouriez, he won, in conjunction with him, the battle of Valmy, by which the Prussians were expelled from the French territory. In 1798 he commanded the army of the Alps, and defeated the Piedmontese, thus bringing about the surrender of Lyons. Notwithstanding his services, he had become unacceptable to the commissioners of the convention, and was consequently dismissed from his command, arrested, and imprisoned for 13 months. After the 9th Thermidor, being reinstated in command of the army on the Alps, which amounted to but 47,000 men, he successfully opposed the repeated attacks of 150,000 Piedmontese and Austrian troops. Although he took no part in the revolution of the 18th Brumaire, Bonaparte appointed him a senator; and on the establishment of the empire he was made a marshal, received the title of duke of Valmy, and held important commands from 1804 to 1818. On the restoration he evinced his readiness to serve the Bourbons, and took a seat in the chamber of peers, where he favored liberal measures.—FRANÇOIS ÉTIENNE, son of the preceding, born in Metz in 1770, died June 2, 1835. He early received a commission in a cavalry regiment. In 1791 he was attached to the embassy of Chevalier de Ternant to the United States, where he spent two years. He returned to France to become aide-de-camp to his father, and lost his position after the siege of Lyons;

but his well known patriotism saved him from imprisonment, and he reëntered the army as a private. On the 9th Thermidor he resumed his former rank, served as adjutant-general under Bonaparte in 1796, and afterward under Masséna, distinguished himself at Bassano, Arcole, and La Favorite, was sent to Paris to present the standards taken from the enemy to the directorial government, and was appointed brigadier-general. In 1800 he accompanied the first consul to Italy at the head of a brigade of cavalry, and participated in the battle of Marengo, where by a well timed charge he decided the victory; he was rewarded by promotion to the rank of general of division. In 1805 he fought brilliantly at Austerlitz, where he was severely wounded. He served in Spain from 1807 to 1812, in Germany in 1813, and in France in 1814, and finally distinguished himself in the engagements that preceded the battle of Waterloo. On the return of the Bourbons he withdrew from the service. He succeeded his father as a peer, and like him inclined to liberal opinions. He wrote two pamphlets in answer to some incorrect statements of the duke of Rovigo about the battle of Marengo, and left *Mémoires*, upon which his son has constructed a history of the campaign of 1800.

KELLGREN, JOHAN HENRIK, a Swedish poet, born in Floby, West Gothland, Dec. 1, 1751, died April 20, 1795. He studied at the university of Abo, and in 1774 went to Stockholm, where he established a journal, the *Stockholms Posten*, in which he combated the French taste then prevailing in Sweden, and introduced to his countrymen the literature of England and Germany. In 1786 Gustavus III. appointed him a member of the newly established Swedish academy, and also made him his private secretary and librarian. His poems, embracing 4 operas which have all the merit of regular historical dramas, were published in Stockholm in 1796, under the title of *Samlade Skrifter*, or "Collected Writings."

KELLY, ALFRED, a public-spirited citizen of Ohio, born in Middletown, Conn., Nov. 7, 1787, died in Columbus, O., Dec. 2, 1859. He received his education in New York, and was prepared for the bar under the tuition of Judge Jonas Platt. In 1810 he removed to Cleveland, O., then a small hamlet, and practised his profession there for several years. He was one of the first advocates of the internal improvement of the state by canals; and when that policy was adopted, he was appointed one of the commissioners to carry it into effect, and was intrusted with the superintendence of one of its most important lines, that connecting Lake Erie with the Ohio river. In 1840 he was appointed one of the canal fund commissioners, having charge of the funds necessary to prosecute the various enterprises in which the state was then engaged, and to pay the interest on the public debt. Between the years 1836 and 1843 the finances of the state had become greatly deranged, and fears were entertained that its obli-

gations could not be met. By Mr. Kelly's exertions, with little aid from others, and on his personal responsibility, a large sum of money was obtained which was applied in discharge of the public debt, and he was ever afterward esteemed as the saviour of the honor of the state. He was chosen by several railroad companies to direct and superintend the construction of their roads, and was repeatedly a member of the general assembly of Ohio, in which he originated many important measures.

KELP, the commercial name for the crude soda ash, obtained from the incineration of certain sea plants. (See ALGÆ, BARILLA, FUCUS, IODINE, and SODA.) It is also the common name of a sea plant of the genus *salicornia*.

KEMBLE, the name of a family distinguished in the annals of the British stage. I. ROGER, the founder of the family, born in Hereford, March 1, 1721, died in 1802, was during a great portion of his life an actor and the manager of provincial companies. He had 12 children, of whom the eldest was the celebrated Mrs. Siddons. (See SIDDONS, SARAH.) II. JOHN PHILIP, eldest son of the preceding, born in Prescott, Lancashire, Feb. 1, 1757, died in Lausanne, Switzerland, Feb. 26, 1823. He was educated at a Roman Catholic seminary in Staffordshire and at the English college at Douay in France, and made his first appearance upon the stage, for which he showed a remarkable inclination, in the tragedy of "Theodosius," Jan. 8, 1776. In 1783 he first acted at Drury Lane, of which theatre he became manager in 1790. From this time until his retirement he stood at the head of his profession. In 1803 he became a part owner of Covent Garden theatre, which he managed prosperously until its destruction by fire in 1808. The opening of the new theatre in the succeeding year under his management was the signal for a series of disgraceful tumults, known as the O. P. ("old price") riots, excited by the increased prices required for admission. For upward of 60 nights Kemble and the members of his family were obliged to endure every species of insult; but a compromise was finally effected, and the theatre was liberally and successfully managed until Kemble's retirement from the stage, June 23, 1817, an occasion commemorated by the poet Campbell in one of his most finished odes. The latter part of his life was passed in Lausanne, whither he had retired for the benefit of his health. In the personation of the dramatic heroes Cato, Coriolanus, King John, Wolsey, Macbeth, and Lear, he had no rival among contemporaneous actors; and in characters of a reflective cast generally he is probably still unequalled on the English stage. As a manager he is distinguished for many splendid revivals of Shakespeare's plays. In private life he was highly esteemed. III. GEORGE STEPHEN, brother of the preceding, born in Kington, Herefordshire, May 3, 1758, died near Durham, June 5, 1822. He was intended for the medical profession, but, following his inclination, went upon the stage, and

made his début in London in Sept. 1788. For many years subsequently he was the manager of a provincial company. He was a good actor, but in the latter part of his life became so corpulent as to be almost incapacitated for any other part than Falstaff, which he frequently acted. IV. ELIZABETH (Mrs. Whitlock), 5th child of Roger Kemble, born in Warrington, Lancashire, April 2, 1761, died Feb. 27, 1836. She first appeared at Drury Lane theatre in Feb. 1783, as Portia. In 1785 she was married to Charles Edward Whitlock, a provincial manager and actor, and 7 years later accompanied her husband to the United States, where they performed for many years in the principal cities. Mrs. Whitlock became the most popular actress of the day in America, and in Philadelphia frequently performed before President Washington and other distinguished persons. She returned to England in 1807 with a competency, and thenceforth retired from the stage. In personal appearance and voice she is said to have strongly resembled her sister Mrs. Siddons. V. CHARLES, the 11th child of Roger Kemble, born in Brecon, South Wales, Nov. 27, 1775, died in London, Nov. 12, 1854. He was educated at the English college in Douay, and upon returning to England in 1792 received a situation in the general post office. He soon abandoned this for the stage, and, after several trials in the provinces, made his first appearance at Drury Lane in April, 1794, playing for the occasion Malcolm to John Kemble's Macbeth and Mrs. Siddons's Lady Macbeth. For several years he took only secondary parts, and by comparatively slow degrees indicated that he possessed the dramatic genius of the family. In 1800 he first appeared as a writer for the stage in an adaptation of Mercier's *Déserteur*, entitled the "Point of Honor," and subsequently he furnished many similar pieces for the German and French for the London theatres. He began meanwhile to acquire considerable repute in his profession, and was accounted one of the best genteel comedians of his time, excelling in such parts as Benedick, Petruchio, Archer, Ranger, Charles Surface, &c.; and also in that numerous class of serious characters represented by Faulconbridge, Edgar, Cassio, Mark Antony, &c., for all of which his handsome person eminently qualified him. In 1832 he made a successful tour in the United States with his daughter, Miss Fanny Kemble, and in 1840 closed his career as an actor. Shortly afterward he was appointed examiner of plays in England. VI. FRANCES ANNE (Mrs. Butler), daughter of the preceding, born in London in 1811. Her mother, long known on the English stage as Mrs. Charles Kemble, was originally a danseuse at the opera house, London, as Miss De Camp. She manifested no special predilection for the stage, but was induced, in consequence of the embarrassed circumstances of her family, to make her début at Covent Garden, then under the management of her father, in Oct. 1829. On this occasion she played Juliet, her father taking the part of Romeo and her

mother that of the nurse, with complete success, notwithstanding that 6 weeks previous she had no thought of embarking in a dramatic career. For the 8 succeeding years she performed leading parts in tragedy and comedy with great applause, distinguishing herself particularly in Juliet, Portia, Bianca in Milman's "Fazio," Juliet in the "Hunchback" (the latter being originally personated by her), Belvidera, Isabella, Lady Teazle, and Louise de Savoy, in her own play of "Francis the First," written when she was 17 years old, and received with great approbation. In 1832 she accompanied her father to the United States, and met with an enthusiastic reception in the chief cities. In 1834 she was married to Mr. Pierce Butler of Philadelphia, and at the same time retired definitively from the stage. Incompatibility of tastes and temperament having rendered the union an unhappy one, a separation took place at the end of a few years, and Mrs. Butler subsequently fixed her residence in Lenox, Berkshire co., Mass. Previous to this she had published her first work in prose, "A Journal of a Residence in America" (2 vols. 8vo., London, 1835; 2 vols. 12mo., Philadelphia), chiefly devoted to a description of her tour through the United States. It was followed in 1837 by a drama entitled "The Star of Seville," which was acted with success; and in 1844 she published a collection of her poems, a portion of which only had previously appeared. In 1846 she visited Europe, extending her travels as far as Italy, where her sister, Mrs. Sartoris, resided, and in 1847 published an account of her tour under the title of "A Year of Consolation." Shortly afterward steps were taken to procure a divorce from her husband, which was granted by the legislature of Pennsylvania in 1849, since which time she has resumed the name of Kemble. In the winter of 1848-'9 she commenced in Boston a series of Shakespearian readings which drew crowded audiences; and during the next two years she repeated the course in some of the principal American cities. In 1851 she returned to England, reappeared for a brief period on the stage, and after giving readings in London and other parts of the United Kingdom, made another long continental tour. In 1856 she returned to the United States, and continued at intervals to give readings in Boston and elsewhere, till Feb. 1860, when she gave her last reading in Boston, and took her farewell of the public. Her present residence is in Lenox, Mass. VII. ADELAIDE (Mrs. Sartoris), younger sister of the preceding, born in London about 1820, made a brilliant début at Covent Garden as an opera singer; but upon being married to Mr. Edward Sartoris, a gentleman of fortune, she retired from the stage.

KEMBLE, JOHN MITCHELL, eldest son of Charles Kemble, an English scholar and historian, born in London in 1807, died in Dublin, March 26, 1857. He was educated by Dr. Richardson, author of the "English Dictionary," and afterward at Bury St. Edmund's grammar

school, and Trinity college, Cambridge. In 1820 he visited Germany, and at this time commenced his study of the Anglo-Saxon and kindred Teutonic dialects. He became acquainted with Thiersch, the brothers Grimm, and other leading philologists and antiquaries of Germany. In 1830 he visited Spain in order to cooperate with the Spanish liberals against the government of King Ferdinand. Returning to England, he began to explore everywhere, in the British museum, and in cathedral and collegiate libraries, for manuscripts of the Anglo-Saxon period, which he deciphered with remarkable skill. His first public effort was his lectures at Cambridge on the Anglo-Saxon literature and language (1834-'5). About this time he published "The Anglo-Saxon Poems of Beowulf, the Traveller's Song, and the Battle of Finnesburgh, with a Glossary and Historical Preface," to the second edition of which he added a translation of Beowulf with a glossary and notes. From 1835 to 1844 he edited the "British and Foreign Review," and contributed thereto many valuable anonymous articles, as he did also to the *Archæologia*, the "Cambridge Philological Museum," the "Foreign Quarterly," and latterly to "Fraser's Magazine." The article on "Jäkel's Comparative Philology" in the "Foreign Quarterly" is the best known of his contributions to periodical literature. In 1839 he commenced the publication of his collection of Anglo-Saxon charters, the *Codex Diplomaticus Aevi Saxonici*. For some years he superintended the publication of several of the archæological works of the Ælfric and Camden societies. In 1849 appeared his "Saxons in England," a work which caused Jacob Grimm to say that Kemble was the first of his disciples. From July, 1849, to May, 1855, Kemble resided in the north of Germany, where he prosecuted his studies, and, as he wrote German with as much facility as his native language, contributed many essays to the "Transactions" of the archæological society of Hanover. In 1854 he was employed by the antiquarian society of Hanover to excavate the sepulchral barrows of pagan times on the heath of Lüneburg. The Celtic and Anglo-Saxon department of the Hanoverian museum attests by its opulence in urns, armor, and ornaments the success of the excavator. In 1857 appeared his last work, "State Papers and Correspondence illustrative of the Social and Political State of Europe from the Revolution (1688) to the Accession of the House of Hanover." At the time of his death he was engaged by the managers of the Manchester exhibition to form a department of Celtic and Anglo-Saxon art. His unexpected demise caused the abandonment of this design.

KEMÉNY, ZSIGMOND, baron, a Hungarian author and publicist, born in Transylvania in 1816. He studied at Zalathna and Nagy-Enyed, was early attracted by politics, and in 1840 became editor of the *Erdélyi híradó* ("Transylvanian Intelligencer"), an opposition journal of Klausenburg. At the same time he was active as one of the leaders of the liberal party in the diet

of his native country. In 1842 he retired to his country estate, and engaged in various literary works, among others *Gyulai Pál* ("Paul Gyulai"), a romance in 5 vols. (Pesth, 1846). In 1848, having removed to Pesth, he became one of the editors of the *Pesti hírlap*, and was also elected member of the diet of reunited Hungary and Transylvania. After the declaration of independence in April, 1849, he was appointed councillor in the ministry of home affairs by Szemere, and, together with his friend and colleague Anthony Csengery, intrusted with the editorship of the *Respublica*, the organ of that prime minister. After the suppression of the revolution he was arrested, but discharged, and his subsequent publications were marked by a considerable change in his political opinions. He has since continued his activity as a political writer and novelist, but chiefly as editor of the *Pesti napló*. The best of his post-revolutionary productions are the lives of the two Wesselényis and of Széchényi in Csengery's "Book of Hungarian Statesmen and Orators" (Pesth, 1850).

KEMP, JAMES, D.D., an American clergyman, bishop of the Protestant Episcopal church in Maryland, born in Aberdeenshire, Scotland, in 1764, died Oct. 28, 1827. He was graduated at Marischal college, Aberdeen, in 1786, and came to the United States in 1787. For a time he devoted himself to teaching, but ere long resolved to enter the ministry of the Protestant Episcopal church, although a Presbyterian by education. He was ordained by Bishop White, Dec. 26, 1789. The next year he became rector of Great Ochoptank parish, Md., where he remained for more than 20 years. In 1802 he received from Columbia college the degree of D.D. Two years later he was elected, though strong opposition was made, as suffragan bishop with Bishop Claggett of Maryland, it being understood that he was to succeed the latter in case he was the survivor. His consecration took place at New Brunswick, N. J., Sept. 1, 1814. The jurisdiction of Bishop Kemp was exercised especially over the parishes on the eastern shore. In 1816, however, on Bishop Claggett's death, the whole diocese came under his charge, and by his prudence and moderation he disarmed opposition and commended himself to both clergy and laity. In 1816 he accepted the provostship of the university of Maryland, and held it until the time of his death. Having had occasion to visit Philadelphia in Oct. 1827, to assist in a consecration, Bishop Kemp on his return home met with a severe internal injury by the overturning of the stage coach near New Castle, Del., and died after three days of intense suffering.

KEMPELEN, WOLFGANG VON, baron, a Hungarian mechanician and inventor, born in Presburg, Jan. 28, 1754, died in Vienna, March 26, 1806. He entered at first upon an administrative career, and became councillor of the court. He was an excellent chess player, and was frequently invited to play with Maria Theresa, who was a passionate lover of the game. Having a great mechanical genius, he in 1769 astonished Europe

with his automaton chess player. Taken to Paris in 1784, and afterward exhibited by Mr. Maelzel in England and the United States, the chess player caused an extraordinary excitement, and the problem was not explained for many years. (See AUTOMATON.) Kempelen also invented an automatic speaking human figure, which pronounced very distinctly several words, a curiosity frequently successfully imitated, and of which the maker published an explanation in his *Le mécanisme de la parole, suivi de la description d'une machine parlante, et enrichi de 27 planches* (Vienna, 1791). He wrote several German poems, *Perseus und Andromeda*, a drama, and *Der unbekannte Wohlthäter*, a comedy. He was also councillor of finance of the emperor of Austria, director of the salt mines of Hungary, and referendary of the Hungarian chancery at Vienna. Full details of the mystery of the automaton chess player, with its later history, are given in an article by Prof. G. Allen of Philadelphia, in "The Book of the First American Chess Congress" (New York, 1859).

KEMPER, an E. co. of Miss., bordering on Ala., and drained by Tugerloo or Suckernoochee creek; area, 750 sq. m.; pop. in 1850, 12,517, of whom 5,278 were slaves. The soil is mostly fertile. The productions in 1850 were 504,685 bushels of Indian corn, 40,495 of oats, 175,960 of sweet potatoes, 4,444 of peas and beans, and 5,115 bales of cotton. There were 14 churches, and 297 pupils attending public schools. The Mobile and Ohio railroad passes through the county. Capital, De Kalb.

KEMPER, REUBEN, an American soldier, born in Fauquier co., Va., died in Natchez, Miss., in 1826. He was the son of a Baptist preacher, who emigrated with his family to Ohio in 1800. Reuben subsequently removed with two of his brothers to the territory of Mississippi, where they engaged in land surveying. They were the leaders in the movement to rid West Florida of its Spanish rule, and got up an expedition to Baton Rouge in 1806 from the adjacent counties of Mississippi, which failed. The Spanish authorities caused the Kempers to be kidnapped, but they were rescued by the commander of the American fort at Point Coupee. The Kempers pursued with great ferocity all who were engaged in this wrong upon them, inflicting severe personal chastisement and mutilation upon the parties. After these occurrences Reuben Kemper, the most powerful and marked of the brothers, devoted himself to the task of driving the Spaniards from the American continent. He was engaged in an attempt to capture Mobile, which failed; and on the fitting out of the formidable expedition of Gutierrez and Toledo, in 1812, against the Spanish authority in Mexico, he was assigned the rank of major, and afterward chosen colonel of the force, 500 or 600 in number, which co-operated with the Mexican insurgents. The expedition advanced into Texas, fought several bloody battles, in which Kemper and his Americans performed extraordinary feats of valor,

and won brilliant victories. Dissensions followed among the victors, between the Mexicans and Americans, and the Spaniards, taking advantage of them, put the republicans to rout. The Americans, disgusted with their allies, then returned home. Reuben Kemper was subsequently engaged under Gen. Jackson in the defence of New Orleans, was detached for important and perilous duty, and added greatly to his reputation as a soldier by his activity and efficiency. At the conclusion of the war he settled in Mississippi, and engaged in planting.

KEMPIS, THOMAS A., a German monk of St. Agnes, the reputed author of the "Imitation of Christ," born in Kempen about 1379, died near Zwolle, July 26, 1471. He was educated among the brethren of the common life at Deventer, who passed a contemplative existence in transcribing manuscripts and in religious exercises. In 1399 he entered the monastery of Mount St. Agnes, near Zwolle, of which his brother was prior, took the monastic vows in 1406, was ordained priest 6 years afterward, and in 1425 was elected sub-prior. He excelled as a copyist, and delighted to transcribe with the utmost care the Scriptures, the church fathers, and works of ascetic piety. The fame of his eloquence and fervor also was widely extended. He owes his present renown to the treatise *De Imitatione Christi*, which has been translated perhaps into every language in Christendom, but of which the authorship is doubtful. It has been ascribed to A Kempis, Gerson, chancellor of the university of Paris, and Gersen, an Italian ecclesiastic; and the question has been debated somewhat with reference to national honor and the interests of ecclesiastical orders. The external evidences in favor of A Kempis are the facts that he is mentioned as the author by 8 writers nearly his contemporaries, that copies exist written in his own hand, and that in one ancient copy he is stated to be the author. There is said also to be a striking likeness in style and refined piety between this and the devotional works of which he is certainly the author. The manuscripts which bear the name of Gerson are less ancient, and his fame as a mystical writer may have caused the work to be attributed to him by persons who had not heard of the retired monk of St. Agnes. There is the least evidence in favor of Gersen. A German translation of the complete works of A Kempis, by Silbert, was published at Vienna (4 vols., 1834). The best biography is that of Mooren, *Nachrichten über Thomas à Kempis* (Orefeld, 1855). Compare Silbert, *Gerson, Gerson und Kempis* (Vienna, 1828), and Manou, *Recherches sur la véritable auteur de l'Imitation* (3d ed., Paris and Tournay, 1858). See also GERSON.

KEN, THOMAS, an English bishop, born in Berkhamstead, Hertfordshire, in July, 1637, died in Longleat, Wiltshire, March 19, 1711. He was educated at Winchester and Oxford, took orders, visited Rome in 1674 in company with his nephew, Izaak Walton, jr., and after his return in 1679 was nominated chaplain to Mary, prin-

ness of Orange, whom he attended to Holland. He was chaplain to Lord Dartmouth during the expedition against Tangier, and in 1684 became chaplain to Charles II., who subsequently raised him to the bishopric of Bath and Wells. Ken attended the king in his last illness. He administered the affairs of his diocese in peace, till he refused to read in his church the declaration of indulgence issued by the government of James II., when, together with the other 6 recusants, he was committed to the tower. When, however, after the revolution, Ken was required to swear allegiance to the new sovereign, rather than do so he suffered himself to be deprived of his bishopric, and retired into obscurity and comparative poverty for the remainder of his life. His latter days were passed at Longleat, and were chiefly devoted to study and composition. He was the author of many devotional writings, the most popular of which are his morning and evening hymns. A collective edition of his works, in 4 vols. 8vo., was published in London in 1721.—See "Life of Bishop Thomas Ken," by George L. Duyckinck (New York, 1859).

KENDAL, or KIRKBY-KENDAL, a market town and parliamentary borough of Westmoreland, England, 50 m. S. from Carlisle, situated in a pleasant valley on the E. bank of the Ken; pop. in 1851, 11,829. Queen Catharine Parr was born here. Kendal is an important manufacturing town, and one of the oldest in the kingdom, the woollen manufacture having been established there by Flemish weavers, on the invitation of Edward III., in the 14th century. Its green cloth seems to have been celebrated in the time of Shakespeare. On an eminence E. of the town is the ruined castle of the ancient barons of Kendal.

KENDALL, a N. E. co. of Ill., drained by Fox river and the sources of the Au Sable; area, 824 sq. m.; pop. in 1855, 10,145. It has an undulating surface diversified by woodland and prairie. The soil is uniformly fertile. The productions in 1850 were 410,986 bushels of Indian corn, 218,660 of wheat, 189,098 of oats, 14,700 tons of hay, 180,270 lbs. of butter, and 15,788 lbs. of wool. There were 3 saw mills, 1 grist mill, 10 churches, and 3,556 pupils attending public schools. The Chicago, Burlington, and Quincy railroad passes through the county. Capital, Oswego.

KENDALL, Amos, an American lawyer and statesman, born in Dunstable, Mass., Aug. 16, 1789. Until the age of 16 he worked with his father, a farmer in moderate circumstances, and enjoyed few opportunities for instruction. In 1807, after a little more than a year's preparation, he entered Dartmouth college, where in 1811 he was graduated the first in his class, notwithstanding he had been obliged to absent himself from college a large portion of each term, in order to procure the means of support by teaching school. Having studied law with W. B. Richardson of Groton, Mass., subsequently chief justice of New Hampshire, he was admitted to the bar, and in the spring of 1814

emigrated to Lexington, Ky. Finding his professional labors not immediately remunerative, he again resorted to teaching, and for several months was a tutor in the family of Henry Clay. Subsequently he established himself in Georgetown, where he received an appointment as postmaster, and in the intervals of his practice edited a local newspaper. So well did he discharge the latter duty that in 1816 he was attached to the staff of the state journal at Frankfort, called the "Argus of Western America." In this responsible position he showed himself an able political writer, and in general advocated the leading measures of the democratic party. He was also one of the earliest friends of common schools in Kentucky, and succeeded in procuring the passing of an act to district the state, and to set apart one half the profits of the bank of the commonwealth to constitute a school fund. He was a firm supporter of the election of Gen. Jackson, who, after his accession to office in 1829, appointed him 4th auditor of the treasury department at Washington. In 1835 he was promoted to be postmaster-general, and in one year succeeded in reorganizing the financial system of the department, and in freeing it from the debt with which it had been embarrassed. In 1836 he procured from congress a reorganization of the department on a plan suggested by himself, which has undergone no essential alteration since. He was retained in office by Mr. Van Buren, but retired from the cabinet in June, 1840, in order to further the interests of the democratic party in the presidential election of that year. He has never since entered public life, although a foreign mission was offered to him by President Polk, but has devoted himself chiefly to his profession. For many years he was embarrassed by a suit instituted against him by certain mail contractors, which was ultimately decided in his favor in the supreme court. Since 1845 he has assumed the entire management of Professor Morse's interest in the American electromagnetic telegraph. He is the author of "Life of Andrew Jackson, Private, Military, and Civil," begun in 1844, but not yet completed.

KENDALL, George Wilkins, an American journalist and author, born in Amherst, now Mt. Vernon, N. H., about 1810. Having devoted several years to the acquisition of the art of printing, he travelled extensively through the southern and western states, working at his trade as a journeyman. He also worked a year or two in New York, whence in 1835 he went to New Orleans. Not long afterward he established there, in partnership with Mr. F. A. Lumsden, the "Picayune," the first cheap daily newspaper issued in New Orleans, which under his direction became a leading southern journal. With a view of recruiting his health and of gratifying a spirit of adventure, he joined the Santa Fé expedition which in 1841 set out from Austin, Texas, and of which he published an account, embracing his own captivity and sufferings in Mexico, entitled "Narrative of the

Texan Santa Fé Expedition" (3 vols. 12mo., 1844). Upon the breaking out of the Mexican war he accompanied the American forces under Taylor and Scott, and witnessed the chief conflicts during the contest. After the termination of hostilities he passed two years in Europe, superintending the publication of a costly illustrated work on the war, which appeared in 1851 in a folio volume under the title of "The War between the United States and Mexico, embracing 12 Colored Plates of the Principal Conflicts by Carl Nebel." In 1852 Mr. Kendall established a large grazing farm in Comal co., central Texas, where he has chiefly resided since that time, having retired definitively from the management of the "Picayune," although he still retains an interest in it. He has been a successful breeder of sheep, and his example and efforts have had considerable influence in developing the resources of that part of Texas.

KENDRICK, ABRAHAM C., D.D., an American Baptist clergyman and Greek scholar, born in Poultney, Vt., Dec. 7, 1809. After receiving a rudimentary education in the common schools, he went when about 18 years of age to Hamilton, N. Y., and there, pursuing his studies mainly by himself, he prepared for the junior class of Hamilton college, at Clinton. At the end of a year he returned to Hamilton, where for two years he was a teacher in the academy. He then reentered college, and was graduated in 1831. He was immediately appointed tutor in the literary and theological institution at Hamilton (now Madison university), and the next year was made professor of Greek and Latin. Released after a few years from the Latin department, he remained the Greek professor till 1850, when, on the establishment of the university of Rochester, he was called to the Greek professorship in that institution, where he still remains. In 1852 he visited Europe, attending the lectures in the university at Athens, and visiting several Italian and German universities on his way home, where he arrived in 1854. Though in clerical orders, he has never had a pastoral charge. In addition to the studies of his own department, he has also paid much attention to oriental learning. Beside numerous contributions to magazines and reviews, he has published sermons, memoirs, a volume of poems, entitled "Echoes," translated from the German, and several Greek text books, and has revised Olshausen's "Commentary on the New Testament." His last work is a memoir of Mrs. Emily C. Judson, now (1860) in press.

KENDRICK, NATHANIEL, D.D., an American Baptist clergyman, born in Hanover, N. H., April 22, 1777, died Sept. 11, 1848. Until the age of 20 he worked on his father's farm. He was baptized in 1798, and 4 years later determined to devote himself to the ministry. He now studied some of the branches of a college course under the Rev. Mr. Burroughs of Hanover, and theology under Dr. Burton of Thetford, Vt., Dr. Emmons of Franklin, Mass., and Dr. Baldwin of Boston. He was licensed by Dr. Baldwin's

church in 1803, and having preached a year at Bellingham, Mass., and declined a call to the pastoral office in that town, he was ordained pastor at Lansingburgh, N. Y., in 1805. He remained there until 1810, and at Middlebury, Vt., from that time until 1817, when he became pastor at Eaton, near Hamilton, N. Y. During all this time he had been obliged to add to his small salary as pastor an income derived from teaching, and in this manner he had prepared himself for the professorship of theology and moral philosophy in the literary and theological institution (now Madison university) at Hamilton, to which he was appointed in 1822. Here for 25 years he acted a distinguished part in the development and government of that institution. He received the degree of D.D. from Brown university in 1838. Neglecting perhaps too much the graces of literary culture, he trained himself, as his own theological instructors had done, to habits of severe metaphysical analysis. His theology was thoroughly Calvinistic, mainly of the Edwards type. He was injured by a fall in 1845, and lingered through great suffering till 1848. A memoir of his life, by his son-in-law, the Rev. S. W. Adams, D.D., is now (1860) on the eve of publication.

KENILWORTH, a parish and village of Warwickshire, England, about equidistant (5 m.) from Leamington, Warwick, and Coventry, containing the splendid ruins of Kenilworth castle. Of the original structure only a massive tower called Caesar's tower is now standing; but there are considerable remains of subsequent additions. Among these is part of the great hall erected by John of Gaunt, 86 feet in length by 45 in width, with windows on both sides, and fireplaces at either end. The walls of Caesar's tower are in some places 16 feet thick. Kenilworth was founded by Geoffrey de Clinton, treasurer to Henry I., but, having passed to the crown, was bestowed by Henry III. on Simon de Montfort, earl of Leicester. When De Montfort was defeated and killed, his adherents held it for 6 months against the king, and at length made favorable terms of capitulation. Edward II. was prisoner in it for some time. Edward III. bestowed it on John of Gaunt, who built large additions to it. When his son Henry Bolingbroke became king, it was again vested in the crown, until Queen Elizabeth bestowed it on her favorite, Dudley, earl of Leicester. Elizabeth visited it 3 times, the last in 1575, being the occasion so graphically narrated by Sir Walter Scott in his novel of "Kenilworth." The castle was dismantled in the time of Cromwell. After the restoration it belonged to the family of Olarendon, and is now the property of the family of Eardley-Wilmot.

KENNEBEC, a S. co. of Maine, traversed from N. to S. by the Kennebec river, and touched on the W. by the Androscoggin; area, 1,050 sq. m.; pop. in 1850, 58,021. It has an undulating surface diversified by numerous small lakes. The soil is highly fertile. The productions in 1850 were 296,108 bushels of Indian

corn, 81,462 of wheat, 295,257 of oats, 880,014 of potatoes, 97,496 tons of hay, 1,124,721 lbs. of butter, and 149,617 of wool. There were 78 saw and planing mills, 15 grist mills, 8 cotton mills, 5 woollen mills, 6 oil cloth factories, 3 iron foundries, 8 newspaper offices, 111 churches, and 20,658 pupils attending public schools. The Kennebec and Portland, Androscoggin and Kennebec, and Penobscot and Kennebec railroads pass through the county. Capital, Augusta.

KENNEBEC, a river of Maine, and next to the Penobscot the most important in the state. Its principal source is Moosehead lake in the N. W. part of the state, on the boundary line between Somerset and Piscataquis counties. It issues from the lake on its S. W. shore, and after a course of 20 m. receives Dead river from the right. Its direction is then changed from S. W. to S., and from this course it has but one considerable deviation, namely, in the S. part of Somerset co., where it flows 12 m. E. It enters the Atlantic in Sagadahoc co. through Sheepscott bay, an irregular indentation of the coast studded with many islands. The largest tributary of the Kennebec is the Androscoggin, which joins it 18 m. from the ocean at Merry-meeting bay. The outlets of a number of small ponds, and Sebasticook and Sandy rivers, also flow into it. The most important towns on its banks are Bath, Richmond, Gardiner, Hallowell, Augusta, Waterville, and Norridgewock. It has falls at Waterville and at 8 points above, which afford excellent motive power. Its whole length is about 150 m., in which it has a descent of 1,000 feet. Large ships can ascend it to Bath (12 m.), steamboats to Hallowell (40 m.), and small craft to Waterville (54 m.). The influence of the tide extends to Augusta, 42 m. from the sea. A dam with locks has been constructed at Augusta for the purpose of improving the navigation above that point, and increasing the water power. The structure is 584 feet long and 15 feet above ordinary high water mark, and cost \$300,000. It forms a pond 16½ m. in extent, with an average depth of 16 feet. The river is closed by ice at Hallowell from the middle of December to about the 1st of April; below Bath it is open at all seasons except during winters of unusual severity.

KENNEBUNK, a township and port of entry of York co., Me., in the S. W. corner of the state, on the sea coast and on the S. W. side of Kennebunk river, 25 m. S. from Portland; pop. in 1850, 2,650; in 1857, about 3,300. It contains 6 churches (2 Baptist, 1 Christian, 1 Congregational, 1 Methodist, and 1 Unitarian), 14 public schools, a bank, 4 or 5 saw mills, and a yarn factory. Ship building and navigation are the principal branches of industry. The registered and licensed tonnage of the district, June 30, 1858, was 13,466; 10 vessels, with an aggregate burden of 3,069 tons, had been built during the year then elapsed. The ship yards are principally on Kennebunk river, on which a lock has been constructed to enable vessels of any size to be floated down to its mouth. About

50 vessels are owned here. The town was formerly much engaged in the West India trade.

KENNEBUNK PORT, a township of York co., Me., on the N. E. side of Kennebunk river and on the sea coast; pop. in 1850, 2,706. The river forms an excellent harbor, and most of the inhabitants are engaged in maritime pursuits. They formerly had a large West India trade, but the craft now owned in the town are principally coasting and fishing vessels. Kennebunk Port and Kennebunk were once the most active seaports in Maine. The town has still some ship-building yards, and is engaged, though not largely, in the lumber trade. It contains large quarries of excellent granite. In 1859 it had 7 churches (1 Baptist, 2 Congregational, 3 Methodist, and 1 Union), 13 schools, several saw mills and grist mills, and a brass foundry.

KENNEDY, GRACE, a Scottish authoress, born in Ayrshire in 1782, died Feb. 28, 1825. She passed the greater part of her life in Edinburgh, and subsequent to 1811 was an industrious writer of works of fiction of a moral and religious character, which were greatly esteemed at home and abroad. Among the most successful were "Decision," "Father Clement," "Anna Ross," "Dunallan," "Jessie Allan," &c., nearly all of which have been translated into French and other languages. Her works were all published under an assumed name.

KENNEDY, JOHN PENDLETON, an American statesman and author, born in Baltimore, Md., Oct. 25, 1795. He was graduated at Baltimore college in 1812. In 1814 he served as a volunteer in the ranks, taking part in the battles of Bladensburg and North Point, on Aug. 24 and Sept. 12. It was his intention to enter the army, but the peace with England altered his plans. In 1816 he was admitted to the practice of the law, which he followed successfully for 20 years. In 1818 he commenced authorship, by the publication, in connection with his friend Peter Hoffman Oruse, of the "Red Book," a serial of light character in prose and verse issued about once a fortnight, and continuing two years. In 1820 he was elected to the Maryland house of delegates, and reelected the two next years. In 1823, being appointed by President Monroe secretary of legation to Chili, he accepted the post, but saw fit to withdraw from it before the mission sailed. Taking a very strong interest in politics, and warmly espousing the cause of President J. Q. Adams, Mr. Kennedy had no opportunity for some years of exercising any public function, the city of Baltimore being devoted to Gen. Jackson; but he diligently labored with his pen in defence of his political principles. In 1830 he wrote a review of the Hon. O. O. Cambreleng's report on commerce and navigation, combating its anti-protective arguments. This reply was widely circulated, and the next year he was appointed a delegate to the national convention of the friends of manufacturing industry meeting in New York, and, in conjunction with Warren Dutton of Massachusetts and Charles J. Inger-

soil of Pennsylvania, was appointed a committee to draft an address advocating the protective policy. In 1832 he published his first novel, "Swallow Barn, or a Sojourn in the Old Dominion," descriptive of the genial and hospitable plantation life of Virginia. This work was very favorably received, and at once established the reputation of its author as a man of letters. In 1835 appeared his second novel, "Horseshoe Robinson, a Tale of the Tory Ascendency," proving the most successful of his writings. The story is of revolutionary days, the scene laid in the Carolinas, and the hero Galbraith Robinson, nicknamed Horseshoe, a real personage whom Mr. Kennedy had met in his travels in 1819. In 1838 he published "Rob of the Bowl, a Legend of St. Inigoes," relating to the Maryland province in the days of Cecilius Calvert, 2d Lord Baltimore. This romance, involving much historic detail of the religious differences of the age between the Catholic and Protestant settlers, as well as vivid pictures of the freebooters who scoured the coasts at that period, has never attracted the same interest as the other tales, although as a work of art it is not inferior to them. All three, revised and illustrated, were republished in New York in 1852. In 1838 Mr. Kennedy was elected to the house of representatives at Washington, and at once took a prominent rank among the whig members. He was chosen one of the electors in the presidential contest which resulted in favor of Gen. Harrison in 1840. In 1841 he was again elected to congress, and appointed chairman of the committee on commerce. In this position he drew up a report upon the reciprocity treaties and their effects on the shipping interest of the country, which commanded much attention. On President Tyler's abandonment of the whigs, Mr. Kennedy was appointed by a meeting of the whig members of both houses to draft a party "manifesto," which he did, defending the anti-democratic policy, and condemning the course of the chief magistrate. In 1843 he was a third time elected to congress. At the next election he was defeated by a small vote, but in 1846 he was returned to the Maryland house of delegates, and chosen speaker. In 1849 appeared his "Life of William Wirt, Attorney-General of the United States," which has passed through a second edition. In 1852, on the retirement of the Hon. William A. Graham from the post of secretary of the navy, he was appointed by President Fillmore to fill the vacancy, and in discharge of his official duties strongly advocated the Japan expedition, and the necessity of its embodying an imposing naval force. He also warmly favored Dr. Kane's second arctic voyage in search of Sir John Franklin. Since 1852 he has divided his occupations between literature, manufacturing business, and railroad interests. His occasional writings and addresses have been very numerous, the best known being "Quodlibet" and "Defence of the Whigs." He has in view the publication of various MSS.,

including notes of two visits to Europe made within the last 5 years. He is provost of the university of Maryland, vice-president of the Maryland historical society, and a member of several learned associations.

KENNET, WHIRRE, an English bishop, born in Dover in 1660, died in Peterborough in 1728. He was educated at Oxford university, took orders, and after various preferments was made bishop of Peterborough in 1718. He left a number of works, among which are: "Ecclesiastical Synods and Convocations historically stated and vindicated against Dr. Atterbury" (London, 1701); "The Case of Impropriations, and of the Augmentation of Vicarages and other insufficient Cures, stated by History and Law" (1704); "History of England, from the Accession of Charles I. to that of Queen Anne," published in the collection of English histories compiled by John Hughes (1706); "*Bibliotheca Americana Primordia*; an Attempt toward laying the Foundation of an American Library" (1718); and "A Register and Chronicle, Ecclesiastical and Civil" (1728). His "Life" was published in London in 1780. He also left a valuable collection of MSS., purchased by the earl of Shelburne, and now part of the "Lansdowne MSS." in the British museum.

KENNICOTT, BENJAMIN, D.D., an English divine, born in Totness, Devonshire, April 4, 1718, died in Oxford, Sept. 18, 1788. He was of humble parentage, but exhibited such capacity that certain benevolent gentlemen contributed funds to send him to Oxford in 1744. Here he so distinguished himself by assiduous study, and the publication of two popular dissertations on the "Tree of Life" and the "Oblations of Cain and Abel," that he obtained his degree of B.A. gratuitously, and before the regular time. Soon afterward he was chosen fellow of Exeter college, and in 1767 he became keeper of the Radcliffe library at Oxford. He was an eminent Hebrew scholar, and undertook to purify the Hebrew text of the Old Testament, maintaining, in an essay entitled "The State of the Hebrew Text of the Old Testament Considered," that the extant MSS. of that text contained important errors, and that the text of the standard Hebrew Bible was in many parts corrupt and erroneous. The publication of this dissertation excited a violent controversy. Among his opponents were Rutherford, professor of divinity at Cambridge, Bishop Warburton, and Horne, afterward bishop of Norwich. The prevalent opinion, however, of candid and impartial biblical scholars, both in England and on the continent, was that Kennicott had established his position. At Kennicott's suggestion a subscription of £10,000 was raised to defray the cost of making a collation of all extant MSS. of the Old Testament. Several eminent scholars engaged in the work, Kennicott himself examining and collating all the MSS. of Britain and France, and Prof. Bruns those of Germany, Switzerland, and Italy. The task occupied 9 years, during which 16 Samari-

tan and over 600 Hebrew MSS. were either wholly or in part collated; and the materials resulting from this investigation filled when transcribed 30 vols. fol. As the result of this Herculean labor, Kennicott gave to the world his *Vetus Testamentum Hebraicum cum Variis Lectionibus* (2 vols. fol., Oxford, 1776-'80), founded chiefly on the text of Van der Hooght, with which the MSS. had been compared. The poetical books are printed according to Lowth's metrical laws of parallelism; the various readings of the Hebrew MSS. are given at the foot of each page, and the Samaritan variations in columns parallel to the text.

KENNON, ROBERT LEWIS, M.D., an American clergyman, born in Granville co., N. C., in 1789, died in Columbus, Miss., in Jan. 1838. He was a descendant of the Washington family, and a near kinsman of William Kennon, one of the three who drafted the Mecklenburg declaration of independence. He received his early education under Dr. Beemon, and continued his studies at the South Carolina college. He joined the Methodist Episcopal conference of that state in 1810. Some years after ill health caused him to abandon the pulpit, and he betook himself to the medical profession. He became a successful practitioner in Georgia, was a devoted student of nature in all its various forms, and particularly devoted to the science of geology. He removed with his family to Alabama, then a territory, and is said to have been the first to call attention to its wealth in coal. Having recruited his health sufficiently to resume preaching, he planted the banner of Methodism on the banks of the Black Warrior, at a point then beginning to be settled, and which afterward became the capital of the state. He was the very soul of the itinerancy, a zealous advocate of the widow and orphan feature of that system, the patron and favorite of all the young ministers who needed a word of encouragement or a helping hand. His labors were mostly given to Mobile, Greensborough, and Tuscaloosa. In the pulpit and in the Sabbath school, at the bedside of the afflicted, in the poor man's humble cabin, or in the most refined and elegant circles, he was equally welcome.

KENOSHA, a S. E. co. of Wis., bounded E. by Lake Michigan and S. by Ill., and drained by Des Plaines and Fox or Pishtaka rivers; area, 806 sq. m.; pop. in 1855, 12,397. It has a level and thinly timbered surface, with a fertile soil resting on beds of limestone. The productions in 1850 were 100,046 bushels of Indian corn, 230,969 of oats, 68,555 of potatoes, 24,229 tons of hay, and 284,798 lbs. of butter. There were 2 saw mills, 2 newspaper offices, 12 churches, and 2,980 pupils attending public schools. The Chicago and Milwaukee, and Kenosha, Rockford, and Rock Island railroads pass through the county. Capital, Kenosha.

KENRICK, FRANCIS PATRICK, D.D., an American Catholic prelate, born in Dublin, Dec. 3, 1797. He received a classical education in the schools of his native city, and at the

age of 18, having resolved to enter the church, was sent to Rome to study philosophy and divinity. He spent 2 years in the house of the Lazarists and 4 at the college of the Propaganda, where he was ordained priest. In 1821 he came to the United States, having been chosen on the recommendation of the officers of the Propaganda to conduct an ecclesiastical seminary just established by Bishop Flagnet at Bardstown, Ky. In the duties of this office he passed 9 years, visiting also from time to time the scattered missions of the diocese. He published in 1828, under the title of "Letters of Omicron to Omega," a series of letters in reply to the Rev. Dr. Blackburn, who had attacked, under the signature of Omega, the Roman Catholic doctrine of the eucharist. On June 6, 1830, he was consecrated at Bardstown bishop of Arath in *partibus infidelium*, and coadjutor to the Rt. Rev. Dr. Conwell, bishop of Philadelphia, with powers of administrator. On Dr. Conwell's death in 1842 Bishop Kenrick became his successor. It was during his episcopate that the anti-Catholic riots occurred in Philadelphia in 1844. He caused an address to be posted up throughout the city calling upon the Catholics to preserve peace and charity, and made every exertion to calm the agitation of both parties. He founded the theological seminary of St. Charles Borromeo in Philadelphia, and in 1849 introduced into his diocese the sisters of the Good Shepherd, who devote themselves to the care of Magdalen asylums. In 1851 Bishop Kenrick was transferred to the archiepiscopal see of Baltimore, made vacant by the death of Archbishop Eccleston. The pope named him "apostolic delegate" to preside over the first plenary council of the United States, convened at Baltimore in May, 1852, and in 1859 conferred upon him and his successors the "primacy of honor," which gives them precedence over all other Roman Catholic prelates in this country. Archbishop Kenrick is regarded as one of the most learned theologians of his creed in America. In 1839-'40 he published a work in the Latin language on dogmatic theology (*Theologia Dogmatica*, 4 vols. 8vo., Philadelphia), which was followed by another on moral theology (*Theologia Moralis*, 3 vols. 8vo., 1841-'3), forming a complete course of divinity, and used as text books in numerous seminaries. An enlarged edition of these works is now being printed at Mechlin, Belgium. Dr. Kenrick has also published a series of letters "On the Primacy of the Holy See and the Authority of General Councils" (1837), in reply to the Rt. Rev. John H. Hopkins, Protestant Episcopal bishop of Vermont, subsequently enlarged and reprinted under the title of "The Primacy of the Apostolic See Vindicated" (4th ed., Baltimore, 1855); "The Catholic Doctrine on Justification Explained and Vindicated" (12mo., Philadelphia, 1841); "Treatise on Baptism" (12mo., New York, 1843); and "Vindication of the Catholic Church," a series of letters in reply to Bishop Hopkins's "End of Controversy Con-

troverted" (12mo., Baltimore, 1855). He has devoted much time to biblical studies, and is engaged upon a revised English translation of the Scriptures with copious notes, which will probably supersede the Donay version. The New Testament (2 vols. 8vo., New York, 1849-'51), the "Psalms, Books of Wisdom, and Canticle of Canticles" (8vo., Baltimore, 1857), and "Job and the Prophets" (8vo., Baltimore, 1859), have already appeared; and 2 volumes more, containing the Pentateuch and the other historical books of the Old Testament, are nearly ready for the press.—PETER RICHARD, D.D., archbishop of St. Louis, Mo., brother of the preceding, born in Dublin in 1806. He was educated at Maynooth, where he was prefect. Having chosen the ecclesiastical state, he was ordained priest in Ireland, and came to Philadelphia, where his brother was already coadjutor. In Philadelphia Mr. Kenrick was employed in pastoral and literary labor; the "Catholic Herald," at the period of its highest reputation, was under his charge, and he wrote a number of translations and original works. He was also promoted to the rank of vicar-general. When Dr. Rosati, first bishop of St. Louis, was seeking a coadjutor on account of his infirmities, his attention was drawn to the brother of the coadjutor of Philadelphia, who was soon after nominated, and was consecrated bishop of Drasa *in partibus*, and coadjutor of St. Louis with right of succession, Nov. 30, 1841, at the age of 35. By the death of Bishop Rosati two years after (1843), Dr. Kenrick became bishop of St. Louis; and in the new circumscription of provinces made in 1847, St. Louis being raised to the metropolitan rank, he became the first archbishop of that city. At the commencement of his administration Bishop Kenrick found the finances of his diocese in a deplorable condition, notwithstanding its possession of an immense property in real estate, which, however, being unimproved and loaded with debt and taxation, was rather a burden than a benefit. The energetic and skilful measures by which he gradually extricated the diocese from this situation, and rendered it one of the most flourishing in the Union in a financial point of view, have acquired for him much local fame. The archbishop also received in 1858 a large bequest, partly for designated charities, partly placed unreservedly at his disposal, which has enabled him to accomplish many noble enterprises. The hospital under the care of the sisters of charity, by his munificence, has been made free, and dispenses its benefits alike to all, without distinction of faith, creed, or color. The orphanage of St. Philomena, the magnificent convents of the Visitation and the Good Shepherd, and numerous other institutions either of charity or education, attest the prosperity of the church under his government. He has adorned the environs of St. Louis with a cemetery which in beauty and extent of the grounds is one of the finest in the world. Beside a number of translations, and editions of devotional works, the

archbishop of St. Louis has published "The Holy House of Loretto, or an Examination of the Historical Evidence of its Miraculous Translation" (12mo.), and "Anglican Ordinations" (8vo.). The latter work has elicited several rejoinders; by Roman Catholics it is generally regarded as conclusive in the controversy.

KENSETT, JOHN FREDERICK, an American artist, born in Cheshire, Conn., March 22, 1818. He studied engraving under Alfred Daggett of New York, and for several years executed vignettes for bank notes, occasionally attempting painting as a recreation. In 1840 he visited England, and about 1845 resigned the burin to take up painting. In the spring of the same year he exhibited in the royal academy, London, his first picture, a distant view of Windsor castle, the purchase of which by a prize holder of the London art union encouraged him to persevere in his new profession. He subsequently passed two winters in Rome, sending home occasionally pictures of Italian scenery, several of which became the property of the American art union. His "View on the Anio" and "Shrine," exhibited at the academy of design in New York in 1848, first brought him prominently before the public, and established his reputation. After an absence of about 7 years he returned to America, and settled in New York, where he has since resided in the active practice of his profession. He has produced many representations of American scenery under various aspects, those in which rocks, trees, or water are prominent features being among his most characteristic and successful works. The mountainous regions of New England and New York, the rivers and lakes of the middle states, and the sea shore have furnished him with frequent subjects; and among his most popular works are his "View of Mt. Washington from North Conway" (1849), "Franconia Mountains" (1853), "October Day in the White Mountains" (1855), "Hudson River from Fort Putnam" (1856), "Falls of the Bashpish," "Sunset on the Coast" (1858), "Eagle Cliff, Manchester, Mass." (1859), "Sunset in the Adirondacs" (1860), views on the Genesee and Hudson rivers and Lake George, and several taken in the vicinity of Newport, R. I. In 1859 he was appointed a member of the national art commission having the direction of the ornamentation of the capitol at Washington, and the superintendence of the works of art deposited there, a position which he still holds. In 1848 he was elected an associate and in 1849 a member of the national academy of design.

KENT, the name of 4 counties in the United States. 1. A central co. of R. I., bounded E. by Narraganset bay and W. by Conn.; area, 186 sq. m.; pop. in 1850, 15,068. It has a diversified surface, and a good soil drained by Flat, Pawtuxet, Moosup, and Wood rivers. A large proportion of the population is engaged in manufactures. The productions in 1850 were 57,401 bushels of Indian corn, 3,977 of oats, 85,052 of potatoes, 8,734 tons of hay, and 101,700 lbs. of butter. There were 18 cotton mills, 6 printing

and bleaching establishments, 8 woollen mills, 8 grist mills, 13 saw mills, 1 newspaper office, 80 churches, and 2,599 pupils attending public schools. The Hartford, Providence, and Fish-kill, and the Stonington and Providence railroads pass through the county. Capital, East Greenwich. II. A central co. of Del., bounded E. by Delaware bay and W. by Md.; area, 640 sq. m.; pop. in 1850, 22,816, of whom 347 were slaves. It has an undulating surface and a fertile soil drained by Choptank and Marshy Hope rivers, and Duck, Jones, Motherkill, and Mispillion creeks. The productions in 1850 were 899,079 bushels of Indian corn, 119,774 of wheat, 105,596 of oats, 67,900 of potatoes, and 19,582 lbs. of wool. There were 17 grist mills, 25 saw mills, 45 cotton factories, 8 newspaper offices, 48 churches, and 4,000 pupils attending public schools. The Delaware, New Castle, and Wilmington railroad passes through Dover, the capital of the state and county, and another railroad is in progress from that city to Oxford, on Chesapeake bay. III. A N. E. co. of Md., bounded E. by Del. and W. by Chesapeake bay, and drained by Sassafras and Chester rivers; area, 240 sq. m.; pop. in 1850, 11,886, of whom 2,627 were slaves. The surface is slightly diversified and the soil moderately fertile. The productions in 1850 were 556,781 bushels of Indian corn, 186,421 of wheat, 186,206 of oats, 44,858 of potatoes, and 856 tons of hay. There were 5 grist mills, 6 saw mills, 1 newspaper office, 87 churches, and 700 pupils attending public schools. Capital, Chestertown. IV. A W. co. of the S. peninsula of Mich., drained by Grand, Rouge, and Thornapple rivers; area, 576 sq. m.; pop. in 1850, 12,016. The surface is moderately uneven, and the soil, which is very fertile, consists of a deep vegetable loam on a substratum of clay. The country is well timbered, and contains limestone, gypsum, and salt. The productions in 1850 were 96,584 bushels of Indian corn, 69,275 of wheat, 61,041 of oats, 77,984 of potatoes, 21,972 lbs. of wool, and 8,770 tons of hay. There were 6 grist mills, 18 saw mills, 2 newspaper offices, 8 churches, and 8,518 pupils attending public schools. The Detroit and Milwaukee railroad passes through Grand Rapids, the capital.

KENT, a S. W. co. of Canada West, bounded S. E. and S. by Lake Erie, W. by Lake St. Clair, and N. W. by Big Bear creek; area, 870 sq. m.; pop. in 1851, 17,469. It is traversed by the river Thames. The surface is generally level, and the soil, especially in the river bottoms, is fertile. Wheat, maize, oats, and tobacco are the principal productions. Capital, Chatham.

KENT, a county of New Brunswick, bordering on the gulf of St. Lawrence and Northumberland strait; area, 1,600 sq. m.; pop. in 1851, 11,410. The Richibucto and Cocagne or Cocayne are the principal rivers. The coasts are broken by several good harbors, which afford excellent opportunities for ship building. Nearly half the county is unsettled, and the most valuable production is timber, which is

exported in large quantities to England. About one third of the inhabitants are French Acadians. Capital, Liverpool.

KENT, a maritime county of England, forming the S. E. extremity of Great Britain, and separated from France by the straits of Dover; length 63 m., breadth 40 m.; area, 1,627 sq. m.; pop. in 1851, 615,766. Chief towns: Canterbury, the capital, Greenwich, Woolwich, Gravesend, Rochester, Deptford, Dover, Maidstone, Hythe, Folkestone, Deal, Chatham, Sheerness, Margate, and Tunbridge Wells. The surface of the county presents a succession of gentle hills, highly cultivated and diversified with plantations, residences, and villages. Romney marsh, of 24,000 acres, occupies the S. E. angle, adjoining which is the tract of land called the Weald, once a forest. Off the E. coast are the Goodwin sands, between which and the land is the naval anchorage of the Downs. The coast of Kent consists in part of chalk cliffs, the highest of which is Shakespeare's cliff, near Dover. The principal rivers are the Thames, forming its northern boundary, the Medway, navigable 40 miles, and the Stour. Wheat and other grains, hops, fruit, and garden seeds are produced in large surplus for export. Over 20,000 acres are under hops, producing annually over 17,000,000 lbs. Estates are small, and are mostly inherited equally by all the sons of intestates under the Saxon law of gavelkind, now nearly peculiar to this county. Iron ware is made at Crayford and Dartford; paper at Boxley, Dartford, and elsewhere; printed calico at Crayford; gunpowder at Faversham and Dartford. There are chemical works at Deptford and Whitstable, and ship yards at Chatham, Deptford, and Woolwich. The south-eastern railway, from London to Dover, traverses the county. The North Kent railway also runs from London, by Woolwich and Gravesend, to Stroud. The county returns 4 members to parliament, beside 14 from its boroughs. It possesses many educational and charitable institutions. The amount expended for the relief of the poor by the board of guardians during the half year ending March 25, 1859, was about £76,000. Kent was a kingdom of the Saxon heptarchy.

KENT, EDWARD AUGUSTUS, duke of, 4th son of George III. of England, and father of Queen Victoria, born Nov. 2, 1767, died Jan. 28, 1820. He joined the British army, and was under the command of Sir Charles Grey in the attack on the French West India islands, where he was noticed for his bravery, and in compliment to him the name of Fort Royal in Martinique was changed to Fort Edward. Soon afterward he was made governor of Nova Scotia, created duke of Kent and Strathearn, with a seat in the house of lords, and appointed commander-in-chief of the British forces in North America. The island of St. John changed its name in his honor to Prince Edward island, which it still retains. Subsequently he returned to Europe, and married the widow of the prince of

Leiningen, youngest daughter of the duke of Saxe-Coburg. Alexandrina Victoria, now queen, was the only child of this union.

KENT, EDWARD, LL.D., judge of the supreme court of Maine, born in Concord, N. H., Jan. 8, 1802. He was graduated at Harvard university in 1821, studied law one year in his native place, and two years in Topsham, Me., with the Hon. Benjamin Orr, and attended in New York city a course of law lectures under Chancellor Kent. Soon after his admission to the bar he settled, in 1825, in the practice of his profession in Bangor, Me., his present place of residence, and early assumed a prominent rank as attorney and counsellor. In 1827 he was appointed chief justice of the court of sessions for Penobscot co., and from 1829 to 1833 represented Bangor and other classed towns in the legislature of Maine. He was afterward mayor of Bangor for two years, and in 1838 was elected governor of the state, in which office he served one year. After an interval of two years he was again elected, and held the office for another term. In 1843 Gov. Kent was appointed by the legislature one of the commissioners at Washington for settling the Maine boundary line, under the Ashburton treaty. In 1848 he was appointed one of the delegates at large to the convention which nominated Gen. Taylor for the presidency, and was the first to designate him as a candidate before that body. On the accession of President Taylor Gov. Kent was appointed consul at Rio de Janeiro, where he remained 4 years. In the spring of 1854 he returned to Bangor, and resumed practice. In 1859 he received from the executive of Maine the appointment of associate justice of the supreme judicial court, and now holds that office.

KENT, JAMES, an American jurist, born in Philippi, Putnam co., N. Y., July 31, 1763, died in New York, Dec. 13, 1847. His grandfather, the Rev. Elisha Kent, whose family was early established at Suffolk, Conn., became in 1740 the Presbyterian clergyman of Philippi. His father, Moses Kent, Esq., was a lawyer, and for some years surrogate of Rensselaer co. James Kent was graduated at Yale college in 1781, studied law in the office of Egbert Benson, the attorney-general of the state, was admitted in Jan. 1785, as an attorney, and in 1787 as a counsellor, and commenced the practice of his profession in Poughkeepsie. He was married in 1786. He soon became remarkable among his contemporaries for his legal learning and literary attainments. He was elected successively in 1790 and 1792 a member of the legislature for Dutchess co. The country was then excited by political discussions, arising from the adoption of the federal constitution, and Mr. Kent became an active and leading federalist, attracting the notice and confidence of Hamilton and Jay. It was by Hamilton's counsel that the reading of the young lawyer was directed to the doctrines of the civil law, and the treatises of the jurists of continental Europe; and thus he acquired the deep knowledge of the works of Pothier and Emerigon and

other civilians, which is to be traced throughout his own writings. His acquaintance with Hamilton ripened into a devoted friendship, which ended only with the life of the great federal leader. In 1793 Mr. Kent was an unsuccessful candidate for a seat in congress for Dutchess co., and in the same year removed his residence to the city of New York. He brought with him a reputation for professional learning and ability, and was appointed by Gov. Jay one of the two masters in chancery for the city of New York. In 1796 he was elected, in the federal interest, one of the city members in the legislature. He was also elected professor of law in Columbia college. Three of his lectures in this capacity, forming together an introduction to his general course, were published in 1797, and attracted the favorable notice of the legal profession. The body of his lectures were not published, but they formed in after years, in some degree, the basis of his celebrated "Commentaries." In 1797, without solicitation, on the nomination of Gov. Jay, he was appointed recorder of the city, then administering a court of civil jurisdiction; and the extraordinary ability he exhibited in the office induced Gov. Jay in 1798 to nominate him a judge of the supreme court. He continued a member of this tribunal till 1814, having been from 1804 chief justice. He was nominated to this office by the retiring judge, Morgan Lewis, who had been elected governor, notwithstanding that they were open and uncompromising political opponents. The supreme court at that time differed widely from the court as at present constituted. It was formed after the model of the English king's bench, being composed of 5 judges, who rode the circuits to try jury cases, and convened during the year at 4 appointed terms to decide reserved questions of law. Both the court and the law itself were in a rudimental state. There were no American law books, and no reports of American decisions, except those of Mr. Dallas, which were just commenced. The proceedings of the court were languid and dilatory; and resort was had for rules of procedure and principles of law almost exclusively to English precedents and decisions. The accession to the bench of a young, energetic, and able judge, produced a striking change. It was the noble and difficult task of the court to expound the principles of the common law, as applicable to American institutions; to define and limit our new constitutional provisions; to construe recent statutes; to bring the principles of commercial law to bear upon transactions of trade and commerce; to devise rules of practice; and in short to adapt to a young and rising nation a complicated yet practical code of laws. That this work was well accomplished, and that a large portion of its success must be attributed to the unremitting energy and talent of the chief justice, will appear from the reports of Mr. Parsons, and the 14 volumes, entitled "Johnson's Cases" and "Johnson's Reports," of the decisions of the supreme court during

the time of Mr. Justice Kent. By the constitution of New York as it then existed an important political duty was imposed on the judiciary of the state. The judges of the supreme court and the chancellor formed with the governor a council of revision, possessing a qualified veto on the acts of the legislature. This council was abolished by the constitutional convention of 1822, the judges themselves acquiescing in the change. They felt that, though the council was often a salutary check upon hasty and unwise legislation, the effect upon the judiciary was unfavorable, as exposing it to the influence and excitements of political parties. The recent publication of the proceedings of the council of revision displays Mr. Kent as prominent and efficient in the discharge of his political, as he had been in performing his judicial duties. His high conservative principles brought him often in opposition to an excited and dominant legislative majority, which however never failed to respect his candor and integrity. In 1814 Chief Justice Kent was appointed chancellor. Up to the time of his appointment, the court of chancery had been of secondary importance in the jurisprudence of the state. This was partly owing to the nature of its business. Complicated trusts and intricate settlements of property, which form the peculiar subjects of chancery jurisdiction, belong to an advanced period of national growth. But the proceedings of the court had been dilatory; its mode of practice was circuitous and expensive, and the court was regarded with disfavor, both by the profession and the community. The change effected by Chancellor Kent was aptly described in an address presented to the chancellor by the members of the bar, on his retirement from the office after 9 years' administration of its duties. They compared him to Lord Nottingham, the English chancellor, who was described by Blackstone as the founder of the equity system of England, and who was "enabled in the course of 9 years to build a system of jurisprudence and jurisdiction upon wise and national foundations." The 7 volumes of Johnson's "Chancery Reports" contain the decisions of Chancellor Kent, and present a profound and extended exposition of the whole system of equity law. In 1822 the chancellor was elected a member of the convention called to revise the constitution of the state. He took an active part in the discussions of this body, and displayed a power of debate remarkable for one so long retired from forensic discussions. His opinions were strongly conservative. He opposed without success the extension of the right of suffrage, and other democratic innovations; but his personal influence and character preserved for the time the court of chancery, which he believed to be a useful means of administering justice. In 1828 his official term ended; and, having attained the age of 60, he found himself, by the then existing constitution of the state, prevented from holding judicial office. Unbroken in constitution, he soon form-

ed for himself new occupations. Returning to the city of New York, whence he had removed on becoming a judge, he was reelected professor of law in Columbia college. For several years he delivered courses of lectures on law to numerous classes. These lectures he gave to the world, in his "Commentaries on American Law" (4 vols. 8vo., 1826-'80). This work has since passed through 10 editions, and has acquired a world-wide celebrity. It has assumed in the United States the position which Blackstone in his own country has long filled by his "Commentaries on the Laws of England." It embraces not merely the jurisprudence of the federal Union, but the municipal law, written and unwritten, of the several states. Vast and comprehensive in plan, elaborate and minute in research, the beauties of its style and its historical learning commend it to the general reader, while it has been proved to be the best guide to the law student, and a valuable aid to the practical lawyer. The last 25 years of Chancellor Kent's life were passed in tranquil pursuits, in enlarging and correcting his "Commentaries," in giving opinions on legal subjects, in advising and deciding on controversies submitted to his decision, and performing all the duties of an active and patriotic citizen. In 1836 he wrote and published, at the request of the common council of the city, a compendious treatise on the charter of New York, and the powers of the municipal officers. In the performance of various and important duties, in the enjoyment of his extensive library, surrounded by domestic peace and universal esteem, his years glided tranquilly on, until, having attained his 85th year, his health began to decline; and with unclouded intellect, and in the humble profession of the Christian's faith, he closed his long, useful, and honorable life. His widow survived him 8 years. He left one son (Judge William Kent of New York) and two daughters.

KENT, WILLIAM, an English painter, sculptor, and architect, born in Yorkshire in 1684, died April 12, 1748. He was of humble origin, but by the liberality of some friends was enabled to study painting in Italy, where he attracted the notice of the earl of Burlington, who gave him a home in his house. He executed the Shakespeare monument in Westminster abbey, and is considered one of the founders of the modern school of landscape gardening.

KENTON, a N. co. of Ky., separated from Ohio by the Ohio river, and bounded E. by Licking river; area, 140 sq. m.; pop. in 1850, 17,088, of whom 830 were slaves. The surface is very uneven, but the soil is fertile. Much of it is laid out in market gardens, whose products find a market in Cincinnati. The productions in 1850 were 478,545 bushels of Indian corn, 80,780 of oats, 12,544 lbs. of tobacco, and 13,561 of wool. There were 20 grist mills, 7 saw mills, 2 newspaper offices, 26 churches, and 1,418 pupils attending public schools. The Covington and Lexington railroad passes through the county. Capital, Independence.

**KENTON**, SIMON, an American pioneer, born in Fauquier co., Va., April 3, 1755, died in Logan co., O., in 1886. At the age of 16 he had an affray with a young man arising out of a love affair; and believing he had killed his adversary, he fled beyond the Alleghanies and became a companion of Boone and the other early pioneers of Kentucky. For a time he acted as a spy of Gov. Dunmore, and subsequently participated in the warfare waged against the British and the Indians west of the Alleghanies, showing remarkable courage, sagacity, and endurance. In 1782, learning that his rival was living, he returned to his native place, and soon after removed with his father's family to Kentucky. He was frequently engaged in Indian warfare, until the expedition under Wayne in 1793-'4 restored tranquillity to the western frontier. As the country began to fill up with settlers, his lands, to which, in consequence of his ignorance of or indifference to legal forms, he had never secured perfect titles, were taken from him, and by repeated lawsuits he was reduced to penury. He nevertheless took up arms in the war of 1812, and fought with the Kentucky troops at the battle of the Thames. In 1824 he appeared in Frankfort in tattered garments to petition the legislature of Kentucky to release the claim of the state upon some mountain land owned by him. His appearance at first excited ridicule, but upon being recognized he was treated with much distinction by the legislature; his lands were released, and a pension of \$240 was procured for him from congress. He died near the spot where, 58 years previous, he had narrowly escaped death at the hands of the Indians.

**KENTUCKY**, an interior state of the American Union, and the second admitted under the federal constitution, situated between lat. 36° 30' and 39° 6' N., and long. 82° 2' and 89° 40' W.; bounded N. by the Ohio river, which divides it from Illinois, Indiana, and Ohio; E. by Virginia, from which it is separated by the Big Sandy river and the Cumberland mountains; S. by Tennessee and a conventional line mostly on the parallel of 36° 30' N.; and W. by the Mississippi, separating it from Missouri; greatest length E. and W. 308 m., greatest breadth 172 m.; area, 37,680 sq. m., or 24,115,200 acres, being 1.28 per cent. of the whole surface of the United States. The state is divided into 110 counties, viz.: Adair, Allen, Anderson, Ballard, Barren, Bath, Boone, Bourbon, Boyle, Bracken, Breathitt, Breckenridge, Bullitt, Butler, Caldwell, Calloway, Campbell, Carroll, Carter, Casey, Christian, Clarke, Clay, Clinton, Crittenden, Cumberland, Davies, Edmondson, Estill, Fayette, Fleming, Floyd, Franklin, Fulton, Gallatin, Garrard, Grant, Graves, Grayson, Green, Greenup, Hancock, Hardin, Harlan, Harrison, Hart, Henderson, Henry, Hickman, Hopkins, Jackson, Jefferson, Jessamine, Johnson, Kenton, Knox, Laurel, La Rue, Lawrence, Letcher, Lewis, Lincoln, Livingston, Logan, Lyon, McCracken, Meade, Madison, Marion, Marshall, Mason, Meade,

Mercer, Monroe, Montgomery, Morgan, Muhlenburg, Nelson, Nicholas, Ohio, Oldham, Owen, Owalee, Pendleton, Perry, Pike, Powell, Pulaski, Rock Castle, Rowan, Russell, Scott, Shelby, Simpson, Spencer, Taylor, Todd, Trigg, Trimble, Union, Warren, Washington, Wayne, Whitley, Woodford, and the 5 following formed during the last session of the legislature: Boyd, Magoffin, Metcalf, Webster, and Wolf. Louisville, Jefferson co., is the largest city and the commercial emporium of the state; Frankfort, Franklin co., is the political capital; Lexington, Fayette co., is the most important inland town. Maysville, Covington and Newport (on opposite sides of the mouth of Licking river, and facing Cincinnati, Ohio), Henderson, and Paducah, are the most important towns on the Ohio river, and Columbus and Hickman on the Mississippi, all of which places now or prospectively are the termini of railroads from the interior. Danville was formerly the capital of the state. Harrodsburg and Boonesborough are the oldest towns. The other most important towns in the state are Bardstown, Bowling Green, Georgetown, Glasgow, Hopkinsville, Lebanon, Paris, Russellville, Smithland, &c.—The population of the state at 7 decennial periods has been as follows:

U. S. Census.	White.	Free colored.	Slave.	Total.
1790.....	61,138	114	11,890	73,077
1800.....	179,871	741	40,248	220,596
1810.....	294,237	1,718	80,561	406,511
1820.....	434,644	2,941	176,732	564,317
1830.....	517,787	4,917	166,218	687,917
1840.....	760,208	7,817	182,258	779,893
1850.....	761,413	10,011	210,951	982,405

Of the white population in 1850, there were 392,804 males and 368,609 females; of the free colored (blacks 7,331, and mulattoes 2,680), 4,863 males and 5,148 females; and of the slave (blacks 181,752 and mulattoes 29,729), 105,068 males and 105,918 females. Density of population, 26.07 to a square mile; proportion of population to that of the whole Union, 4.24 per cent.; relative rank of the state with reference to population, the 8th. Decennial increase of population from 1799 to 1850: 202.86, 88.98, 88.82, 21.90, 13.36, and 25.98 per cent. Should the population have increased in the same ratio as in the decade 1840-'50, it will now (1860) amount to 1,287,684. Families in 1850 (white and free colored), 182,920, and dwellings 180,769. Of the total population (1850), 80,073 were under 1 year of age; 1 and under 5, 128,919; 5 and under 10, 151,829; 10 and under 15, 132,909; 15 and under 20, 110,886; 20 and under 30, 172,220; 30 and under 40, 105,810; 40 and under 50, 68,588; 50 and under 60, 40,764; 60 and under 70, 22,181; 70 and under 80, 9,432; 80 and under 90, 2,927; 90 and under 100, 555; 100 and upward, 157; unknown, 205. Of those of 100 or more years of age, 59 were whites, 17 free colored, and 81 slaves. White and free colored (total 771,424) born in Kentucky, 601,764; in other states, 189,117; in foreign countries, 29,189; of unknown origin,

1,354; natives of Kentucky resident in other states, 257,643. Ratio of foreign born to total, 8.78 per cent. Of 191,075 males (white and free colored) over 15 years of age, 86,598 were employed in commerce, trade, manufactures, the mechanic arts, and mining; 115,017 in agriculture; 28,413 in labor not agricultural; 204 in the army; 1,027 in sea and river navigation; 3,811 in law, medicine, and divinity; 4,420 in other pursuits requiring education; 902 in government civil service; 212 in domestic service; and 471 in other occupations. Slaveholders, 88,885, viz.: holders of 1 slave, 9,244; of 1 and under 5, 13,284; of 5 and under 10, 9,579; of 10 and under 20, 5,022; of 20 and under 50, 1,198; of 50 and under 100, 53; of 100 and under 200, 5. The relative rank of Kentucky with reference to slaves is the 9th. Deaf and dumb, 568, viz.: white 507, free colored 5, and slave 51; blind, 552, viz.: white 419, free colored 20, and slave 113; insane, 527, viz.: white 502, free colored 2, and slave 23; idiotic, 907, viz.: white 796, free colored 20, and slave 91. Paupers supported in 1849-'50, 1,126; cost, \$57,543; on June 1, 1850, 777. Criminals convicted, 1849-'50, 160; in prison, June 1, 1850, 52. Federal population (all the free and  $\frac{3}{4}$  of the slave) 898,012, which entitled Kentucky to 10 representatives in congress.—The western part of the surface of Kentucky is nearly level, the broad plains being varied by gentle undulations. The S. E. is broken by the Cumberland mountains and their offshoots. Narrow, deep, and gloomy valleys intervene between the ridges. None of the summits, however, attain a greater altitude than 3,000 feet, and their mean elevation does not exceed 2,000 feet. The whole of this region is well wooded, especially the foot hills and valleys. To the N. and W. of the hilly region lies what may be called an upland, which extends from the Big Sandy river to long. 86° W. and comprehends more than half the whole area of the state. Its surface is undulating, with gentle ascents and descents, but it is intersected by numerous narrow and deep valleys in which the rivers run. Though this upland is sparingly provided with spring water, its soil is of the first quality and equal to any in the Union. The W. portion of the state is divided between the "barrens" and a country which is partially hilly. The barrens, which occupy chiefly the tract between the Green and Cumberland rivers, in their natural state are generally destitute of trees, resembling in this respect the prairies N. of the Ohio river; but the level surface is diversified by low round-topped hills, called "oak knobs" on account of the trees which cover them. This tract is the least fertile portion of the state. The alluvial bottoms between these hills and the Ohio and its affluents are exceedingly rich. On the N. and W. the barrens are margined by a more broken and hilly country, which gradually passes to the low flats which skirt the Ohio and Mississippi rivers. This tract is superior in fertility to the barrens, but cannot be compared with the upland coun-

try.—Kentucky is amply provided with noble streams. The Mississippi forms its W. limit for a distance of 80 m. Along the N. W. and N. boundary runs the Ohio in a winding course for nearly 600 m., navigable throughout, and affording with its chief affluents water communication to all parts of the state. The Mississippi receives from Kentucky only a few inconsiderable tributaries. Of the streams which flow into the Ohio, the most eastern is the Big Sandy, which rises in Virginia on the Great Flat Top mountains, a portion of the Alleghany range; where it approaches Kentucky it turns nearly due N., and continues in that direction to its outlet, forming the boundary between the two states; it is navigable only for a short distance, owing to falls which occur where it issues from the mountain region. The Licking rises in Floyd co., flows with many windings in a N. N. W. direction for more than 100 m., and falls into the Ohio between Covington and Newport, opposite Cincinnati; in winter and spring it is navigable for boats 70 m. The different branches of the Kentucky river rise in the Laurel mountains, and form by their union a considerable stream which flows first N. W., then W., and at last nearly due N.; its course is about 260 m., and though very rapid it may be navigated by steamboats to Frankfort, 60 m., and by small boats for 100 m. higher. Green river rises in the W. districts of the upland region, and flows W. for a great part of its course, to its junction with its chief affluent, the Big Barren, where it deflects to the N. W. and finally to the N., joining the Ohio about 50 m. above the Cumberland; its length is about 300 m., and it is navigable for steamboats to Greensburg, 200 m., and for boats nearly to the heads of the stream, but navigation is obstructed by falls about 50 m. above its mouth. Cumberland river rises in the valley between the Cumberland and Laurel mountains; it traverses both the mountain and the upland regions, generally in a westerly direction, but on approaching the barrens it turns S. and enters Tennessee, where it makes a large bend and then reenters Kentucky with a N. W. course, and so continues to the Ohio, which it enters about 10 m. above the mouth of the Tennessee; it is nearly 600 m. long, and as its current is comparatively gentle it offers an easy navigation for sloops and steamboats as far up as Nashville, Tenn., 200 m. from its mouth, and at high water to Burkesville, Ky.; for boats of 15 tons it is navigable for 300 m., and for river boats much higher. The Tennessee flows only about 70 m. through Kentucky; it admits steamboats to Florence, Ala., 300 m. from its mouth.—Kentucky lies wholly in the great region of stratified rocks of the West. These traverse the state in layers so nearly horizontal, that often over broad districts no dip is perceptible to the eye. Through the central portion of the state, from N. to S., the silurian groups, which are here almost exclusively calcareous in their character, thus overspread the surface for nearly 100 m. in width, and form

the great central axis of the lowest rocks. At Louisville they disappear by reason of their very gentle westward dip, and pass beneath the limestones of the devonian age, which here lie exposed in horizontal strata, forming the bed of the river and the reefs which occasion the falls at this place. They are succeeded by the carboniferous limestone, and still further W. the coal measures, commencing at Rome on the Ohio river, are traced almost to the mouth of this river. This is the southern end of the coal field of Illinois and Indiana, which extends S. nearly across the western portion of Kentucky. (See ILLINOIS.) In this portion occurs the Breckenridge coal, so well known for its excellent qualities for producing coal oil. To the E., about 100 m. from Louisville, the same repetition of the formations is encountered, as the silurian rocks dip E. on this side of the axis; and the coal measures which occupy the whole eastern portion of the state are a part of the great Appalachian coal field which overspreads western Virginia and Pennsylvania. The limestones abound in fossil remains, and those of the falls at Louisville are especially famous for the remarkably fine coralline productions they afford. When the river is low and the rocks in its bed are exposed to view, they appear like the coral reefs produced by living zoophytes, the softer portions being wasted and worn away, so that the hard calcareous corals stand out in relief precisely as if they were living. Fine selected specimens being placed in juxtaposition with others of recent growth, none but a zoologist would be able to guess which were ancient and which modern. These limestones also abound in caves, some of which, as the Mammoth cave (see CAVE), situated near Green river in Edmonson co., are among the most remarkable of these curiosities. Upon their walls are found incrustations of saltpetre, which in some instances have been profitably collected. In some of the superficial depressions of the limestone are found the low swamps known as "licks," frequented by deer and elk, and in ancient times by the buffalo, and in a still more distant epoch by the extinct species of elephant, horse, mastodon, megalonyx, &c., whose bones are occasionally found near the saline springs of these quagmires. One of the most remarkable of these localities is the Big Bone lick, 23 m. S. W. from Cincinnati. The metallic productions of Kentucky are of little importance. In 1856, 86,563 tons of iron were made from 30 blast furnaces. Lead ores have been worked to a small extent. Salt springs occur in many places among the sandstone rocks, and sulphur, saline, and chalybeate springs are numerous.—The blue limestone region, which was originally covered with forests of large trees and a dense undergrowth of reeds, contains the richest soil in the state, and that part of it between the Ohio and the vicinity of Lexington is commonly called the "garden of Kentucky." The barrens are thinly wooded, but produce good pasturage, so that the average fertility of Kentucky may be considered equal to that

of any other state in the Union. The climate is remarkably pleasant. The mean annual temperature is about 55° F.; in winter the thermometer frequently falls to 20° or 15°, and in summer rises to 94° or 100°. The winters are sometimes prolonged from late November to early April, but it is seldom that snow lies long on the ground, and in the S. counties cattle and sheep are abroad throughout the coldest seasons. In spring and summer S. W. winds prevail, and the weather is delightful. The N. W. wind produces the greatest winter cold. Rain falls abundantly in winter and spring, but is sometimes scanty in the summer and autumn, the weather in those seasons being characteristically dry and constant.—There are still extensive forests in Kentucky. In the mountain and upland region are found chiefly tulip trees, elm, oak, hickory, walnut, cherry, &c.; those of the barrens are chiefly oaks, chestnuts, and elms. Among the more generally diffused and most useful trees are the sugar maple, the honey locust, and the coffee tree, with the pawpaw and others which furnish household staples of great value. The principal fruit trees are the apple and peach. Beside being a great grain-growing state, Kentucky produces more than half of the hemp grown in the Union, and  $\frac{1}{2}$  of the flax. In the S. W. districts, along the Tennessee, Cumberland, and Mississippi rivers, cotton is raised; and the tobacco which is grown in these regions and in the rich soil further E. supplies a valuable material to the commerce of the state, Kentucky producing more than a fourth part of all the tobacco grown in the United States. At the census of 1850, Kentucky contained 74,777 farms and plantations, enclosing 16,949,748 (improved 5,968,270, and unimproved 10,981,478) acres of land, or about  $\frac{2}{3}$  of the whole surface of the state. The cash value of these was \$75,814,898, and the cash value of implements and machinery used in agriculture was \$11,576,988. The live stock in the state consisted of 815,682 horses, 65,609 asses and mules, 247,475 milch cows, 62,274 working oxen, 442,768 other cattle, 1,102,091 sheep, and 2,891,168 swine—in all valued at \$29,661,486; and the value of animals slaughtered in the census year was \$6,462,598. The product of animals in the same year consisted of 9,947,523 lbs. of butter, 218,954 of cheese, and 2,297,488 of wool. The grain crops of 1849 were as follows: wheat 2,142,822, rye 415,078, oats 8,201,811, Indian corn 58,672,591, barley 95,343, and buckwheat 16,097 bushels. The potato crop amounted to 2,490,666 (Irish 1,492,487 and sweet 998,179) bushels, the hay crop to 118,747 tons, and the crops of beans and peas to 202,574 bushels. The staples produced were: hemp 17,787 tons, flax 2,100,116 lbs., and tobacco 55,501,196 lbs. The other enumerated products were: cotton, 803,200 lbs.; rice, 5,688 lbs.; hops, 4,809 lbs.; clover seed, 3,230, and other grass seed 21,481 bushels; beeswax and honey, 1,158,019 lbs.; flax seed, 75,801 lbs.; maple sugar, 437,405 lbs.; molasses, 80,079 galls.; silk cocoons, 1,281 lbs.; wine, 8,093 galls.,

&c. The value of market garden products was \$303,120, and of orchard products \$106,230. The total value of agricultural productions returned at the census of 1850 was \$52,477,630; in 1840 the value was only \$26,283,968. The actual crops per acre as returned in 1850 were as follows: wheat 8, rye 11, Indian corn 24, and oats 18 bushels; tobacco 575 lbs.; Irish potatoes 130 and sweet potatoes 65 bushels; hay 1½ tons; hemp 650 lbs.—There are 8 other states that are higher in the scale of values in manufactures than Kentucky. In 1850 there were in the state 8,609 establishments engaged in manufactures, mining, and the mechanic arts. These employed 22,445 males and 1,940 females, and a capital of \$12,350,734. The raw material used was valued at \$12,170,225, the annual wages paid amounted to \$4,764,096, and the value of the products was \$24,588,483. Among the establishments are enumerated 8 cotton mills, with a capital of \$289,000; 25 woollen mills, \$249,820; 21 works for pig iron, \$924,700; 20 works for iron castings, \$502,200; 4 works for wrought iron, \$176,000; 81 distilleries and breweries, \$201,835; 12 salt works, \$121,450; 275 tanneries, \$768,455, &c. The principal manufacturing centre is Louisville.—Kentucky has no direct foreign commerce, but its domestic commerce is very extensive. The chief commercial places are Maysville, Covington, Louisville, Henderson, Smithland, Paducah, &c., on the Ohio, Columbus on the Mississippi, and Lexington in the interior. The principal exports are hemp, flax, tobacco, horses, cattle, bagging, and rope. The shipping owned in the state (all steam) in 1850 amounted to 14,820 tons, and in 1859 to 29,627 tons. The number of vessels (steamers) built in 1850 was 84, having an aggregate measurement of 6,461 tons; and in 1859, 20, of 3,816 tons. Internal improvements have been well attended to in Kentucky, and all the large rivers have been rendered navigable for considerable distances above their natural heads of navigation; the works on the Kentucky, Green, Licking, and Big Sandy are the most important. The Portland and Louisville canal has been constructed around the falls on the Ohio, and is an important avenue of commerce. It is proposed to construct another on the opposite side of the river in Indiana. The following table shows the railroads in operation and in progress in Jan. 1860:

Railroads.	Total miles.	Miles open.	Cost.
Breckenridge Coal.....	8.5	8.5	\$812,000
Covington and Lexington.....	80.0	80.0	4,183,971
Lexington and Big Sandy.....	138.0	17.0	694,024
Lexington and Danville.....	85.0	18.0	824,433
Lexington and Frankfort.....	99.0	99.0	642,701
Louisville and Frankfort.....	65.1	65.1	1,567,588
Louisville and Nashville.....	184.5	134.5	—
Memphis Branch.....	81.7	0.0	4,384,980
Lebanon Branch.....	37.6	37.6	—
Maysville and Lexington.....	89.0	18.8	575,000
Mobile and Ohio.....	42.5	90.0	500,000
Paducah and Mobile.....	58.5	58.5	1,170,000
Portland and Louisville.....	5.0	5.0	100,000
Total.....	892.4	537.0	\$15,856,890

From the above 27 miles must be deducted for that portion of the Louisville and Nashville railroad within Tennessee, leaving for Kentucky 510 miles. All of these lines have been constructed by private capital, the state never having as yet afforded any aid to the several companies. Beside the roads above noticed, there are others of equal importance now in progress, as the Henderson and Nashville railroad, one or two from Danville or other point S. of Paris to Knoxville, and the Memphis and Ohio railroad, which is not yet open as far as the Kentucky frontier.—On Jan. 1, 1860, there were in Kentucky 37 banks and branch banks, with an aggregate capital of \$12,216,725; liabilities: circulation \$9,389,426, deposits \$4,042,686, profits on hand \$859,316; resources: notes and bills of exchange, &c., \$21,634,719, specie \$4,864,931, real estate \$508,503; balance total, \$26,508,153.—The present constitution of Kentucky was adopted in 1850. Every free white male citizen 21 years of age, who has resided in the state 2 years, in the county one year, and in the precinct 60 days next preceding an election, is entitled to vote. The general election is fixed by law on the first Monday in August, and voting is *viva voce*. The legislature consists of a senate of 38 members, and a house of representatives of 100. Senators must be 30 years of age, and are chosen for 4 years, one half every second year. Representatives must be 24 years of age, and hold office two years. The sessions of the legislature are biennial, beginning on the first Monday of December in every odd year, and lasting not longer than 60 days unless by vote of ⅔ of both houses. Members are paid \$4 a day, and 15 cents a mile for travel. The governor is chosen for 4 years; the present term ends Sept. 30, 1863. He must be 35 years of age, a citizen of the United States, and have been resident in the state for 6 years. He is ineligible to the office for the 4 years succeeding his term. The lieutenant-governor, auditor, attorney-general, register of land office, and superintendent of public instruction are also elected for 4 years. The lieutenant-governor, with the same qualifications as the governor, is *ex officio* president of the senate. If a vacancy occurs in the office of governor during the last half of the term, the lieutenant-governor, and failing him the speaker of the senate, would act as governor; but if during the first half of the term, then the people hold a new election. The treasurer is elected by the people every 2 years. The secretary of state is appointed by the governor, by and with the advice and consent of the senate, and holds office during the governor's term. The official salaries are: for the governor \$2,500, secretary of state \$1,000, auditor \$2,000, register of land office \$1,250, treasurer \$1,700, and superintendent of public instruction \$1,000. The pay of the lieutenant-governor is \$8 a day during attendance at the legislative session. The judiciary consists of the court of appeals, circuit courts (14 in number), and county courts. Louisville has a separate chancery

court. The court of appeals consists of a chief justice and three judges, the attorney-general, a clerk, sergeant, and reporter. The judges have each \$2,500 a year, and the attorney-general \$500 and fees. The Louisville chancery court consists of a chancellor (salary \$1,800), a clerk, and a marshal (fees). The first judicial district has also a chancellor and criminal judge, whose salary is \$1,800. The judges of circuit are paid \$1,800, and attorneys \$500 and fees. All judges and other officers of courts are elected by the people. The revenue is derived chiefly from direct and specific taxes and the poll tax. The ordinary receipts for the year ending Oct. 10, 1859, amounted to \$1,020,351, and the expenditures to \$883,887. At the end of that financial year there was remaining in the treasury a surplus of \$136,463. The state debt at that time amounted to \$5,479,244, of which \$3,497,412 was held by individuals, \$600,000 by the bank of Kentucky (the bank paying interest), and \$1,881,832 by the board of education. To pay this debt a sinking fund has been established, which is augmented annually by specific taxes, premiums on state bonds, dividends on stock, a *pro rata* tax (5 cents per \$100) on property, &c., and all excess of revenue at the end of each year over \$10,000. The interest on the state debt has been punctually paid. The receipts of the sinking fund for the year 1858-'9, including balance from 1857-'8 (\$41,164), were \$572,877, and the expenditures for the same year \$405,986. The value of taxable property in 1859 was \$498,409,868, being an increase in 10 years of \$176,820,764. The rate of taxation is 20 cents on the \$100, viz., 10 cents for ordinary expenses, 5 cents for the sinking fund, and 5 cents for the school fund. The state holds stock in internal improvement companies of the nominal value of \$4,830,475; in banks and railroads, of \$2,162,820; and the sinking fund, \$758,268; total, \$7,751,578. The principal institutions supported wholly or in part by the state are the lunatic asylum at Lexington, the western lunatic asylum at Hopkinsville, the deaf and dumb asylum at Danville, the school for the blind at Louisville, and the state penitentiary at Frankfort.—The following school statistics are taken from the census of 1850:

Schools.	Num-ber.	Teach-ers.	Pupils.	Annual cost.
Public and primary schools....	2,234	3,306	71,429	\$211,859
Academies and private schools	890	600	12,712	252,617
Universities and colleges.....	15	100	1,778	181,461
Total.....	2,579	3,006	85,914	\$545,937

Free persons over 20 years of age unable to read and write, 69,706, of whom 66,687 were white and 3,019 free colored persons. The number of children in the state between 6 and 18 years in 1858 was 240,799; the number reported as having attended school in the year was 267,712, and the average attendance was 97,001. The school fund amounted in the same year to \$1,455,332, and the amount distributed for school support was \$304,983. The princi-

pal colleges and professional schools in the state are as follows:

Name.	Location.	Founded.	No. of professors.
Transylvania University.....	Lexington.....	1793	8
St. Joseph's College.....	Bardstown.....	1819	30
Centre College.....	Danville.....	1833	5
Augusta College.....	Augusta.....	1825	4
Bacon College.....	Harrodsburg.....	1836	4
Shelby College.....	Shelbyville.....	1837	6
Georgetown College.....	Georgetown.....	1840	7
Western Military Institute.....	Drennon Springs.....	1847	9
St. Aloysius College (R. C.).....	Louisville.....	1849	6
Paducah College.....	Paducah.....	1852	7
Western Baptist Theological Seminary.....	Covington.....	1840	4
Theological School (Presb.).....	Danville.....	1858	4
St. Mary's Theol. Seminary.....	New Lebanon.....	1858	1
Kentucky School of Medicine.....	Louisville.....	.....	10
University of Louisville.....	Louisville.....	.....	18

—The whole number of church buildings in the state in 1850 was 1,845, with accommodation for 671,053 persons, and valued as property at \$2,252,448. The number of newspapers was 62; of these, 9 were issued daily, and circulated annually 2,243,584 copies; 7 tri-weekly, 1,125,280 copies; 38 weekly, 3,053,024 copies; and 8 semi-monthly, 160,950 copies; total annual circulation, 6,582,838 copies; and 12 (circulating at each issue 14,900 copies) were literary and miscellaneous; 2 (800 copies) neutral and independent; 42 (55,936 copies) political; 5 (12,525 copies) religious; and 1 (525 copies) scientific. The periodical press in 1859 comprised 70 publications, of which 2 were semi-monthly, 54 weekly, 2 semi-weekly, 7 tri-weekly, and 5 daily. The number of libraries (other than private) in the state in 1850 was 80, and these contained 79,466 volumes, viz.: 47 public libraries, with 40,426 volumes; 18 Sunday school libraries, 4,617 volumes; 11 college libraries, 33,225 volumes; and 4 church libraries, 1,200 volumes.—The earliest explorers of Kentucky were Boone and Knox. Then came Bullitt, Harrod, and Henderson, and next Kenton, Calloway, and Logan. The exploits of Boone commenced in 1769; he subsequently founded Boonesborough. Harrodsburg was founded in 1774, and Lexington a year or two later. History, however, is not very exact in regard to the precise dates of these foundations, but it is conceded that these towns were, with the exception of the French settlements, the oldest in the West. Kentucky was now made a county of Virginia, and in 1777 the first court was held at Harrodsburg. The fame of the new country soon spread far and wide, and settlers rapidly increased in numbers. Conflicts between the white and red races were frequent, and it is said that from this fact and that of its having been the scene of savage warfare for ages, the name Kentucky, meaning in the aboriginal language "the dark and bloody ground," had its origin. The war of the revolution left the settlers in constant danger of Indian outrage, and the citizens found themselves obliged to undertake their own protection. Richmond, Va., the capital, was too far distant to be relied on for assistance in times of need, and hence the

conventions held at Danville in 1774-'5 recommended a peaceable and constitutional separation from Virginia. The 3d convention sent a petition to Richmond, and in 1786 an act was passed by the legislature complying with the desires of Kentucky; but from several causes the separation was not then completed, chiefly from an inclination of the people to obtain an independent nationality. A 4th convention only served to inflame the people against the central government; and a report having gained currency that Mr. Jay, when minister to Spain, had ceded the navigation of the Mississippi to that country, the utmost ill feeling was aroused in the public mind. A 5th convention met, and on petition Virginia allowed the Kentuckians to send a delegate to congress; but the constitution having in the meanwhile been adopted, the whole subject was turned over to the new government. Taking advantage of this position of affairs, Spain clandestinely proposed through her minister peculiar commercial favors to Kentucky in case of her forming an independent government. These propositions met with some favor; but a 6th and a 7th convention were assembled, and though party politics ran high in the debates, constitutional measures at length prevailed, and an address to congress was ultimately voted. Two more conventions were subsequently held, and the question was determined by Kentucky becoming in 1790 a separate territory, and its admission into the Union on June 1, 1792. The population at this time was about 75,000. Indian wars, however, continued to disturb the frontiers, and complaints of the inefficiency of the federal government were again heard. The whiskey tax also became oppressive, and the American policy toward the French republic was denounced in every cabin. The minister Genest was received in triumph throughout the West, and it was even proposed to raise troops in Kentucky to make a descent on New Orleans; nor did the governor scruple to write to the secretary of state: "I shall feel but little inclination in restraining or preventing my fellow citizens . . . to gratify or remove the fears of a minister of a prince who openly withholds from us an invaluable right, and who secretly instigates against us a savage and cruel enemy." The old idea of independence was again mooted, but the storm passed over. In the 10 or 12 years which succeeded, and which included the period of negotiation for the navigation of the Mississippi, and then for the purchase of Louisiana, Kentucky was again agitated. The treaty of 1795 with Spain gave to the United States the right of deposit at New Orleans and the freedom of the river. Pending the negotiations the governor of Louisiana had approached some leading Kentuckians with a view to a different treaty, but action on these premises was stayed by federal interference, and the faithlessness of the Spaniards was soon made evident. Seven years now passed in comparative quiet and prosperity, when the whole nation became excited

by the intelligence that the Spaniards had violated the treaty of 1795 by a denial of the rights secured by its provisions, and it became known that even Louisiana had been retroceded to France. Its subsequent purchase by the United States put an end to all pending troubles. In the war of 1812 Kentucky took an active part. Upward of 5,000 volunteers were called into active service, and at one time more than 7,000 Kentuckians are said to have been in the field. During this period the chair of state was filled by Isaac Shelby, a hero of the revolution, who at an advanced age manifested the same enterprise and bravery that had gained him an honorable reputation in the battle of King's mountain. At the battle of Frenchtown and the barbarous massacre which followed it, many of the best citizens of Kentucky were destroyed; and the impetuous but ill regulated courage of the state militia at the unfortunate attempt to relieve Fort Meigs proved fatal to a large body of her troops. Since the treaty of 1815 the history of Kentucky has been undisturbed by any stirring events. Its progress has been rapid, and the development of agriculture and other branches of industry within her borders signally well sustained. The scene of action in the Mexican war was too far distant to affect the fortunes of the state, but many of its best and bravest citizens were engaged in that contest, and by their prowess elevated the reputation of the commonwealth before the world, and gained for the sons of the "dark and bloody ground" a name worthy of their patriotism.

KENTUCKY, a river of the state of the same name, rising in the Cumberland mountains on the S. E. frontier. Its principal feeders are the North, Middle, and South forks, which unite in Owsley co. near the village of Proctor. The stream then takes a N. W. direction to the S. boundary of Fayette co., where it turns toward the S. W. After keeping on this course for 15 or 20 m. it resumes its former direction, and preserves it until it enters the Ohio in Carroll co. Its length from the junction of its head streams to its mouth is 260 m., but the distance in a straight line between these two points is only 108 m. The scenery on the banks is famous for its romantic beauty. For a great part of its course the river flows between perpendicular limestone rocks, through which it appears to have gradually worn its way. The Kentucky has no large tributaries. It is navigable by steamboats to Frankfort, 60 m. from its mouth. By means of a series of dams and locks a depth of at least 6 feet has been secured to the confluence of the forks. There are 17 dams, giving a rise of from 20 to 25 feet each, and the same number of locks, each 178 feet long and 38 feet wide. Anthracite coal, iron ore, and an excellent variety of marble are found along the banks of the river.

KENYON, JONX, an English poet, born in the island of Jamaica about 1783, died at Cowes, in the isle of Wight, Dec. 8, 1856. His father was a wealthy planter. While a child he was

sent to England and educated at the Charterhouse and other schools, and was graduated at Peterhouse college, Cambridge. After leaving the university he cultivated the acquaintance of Coleridge, Southey, Wordsworth, and other eminent men, and in 1815 he visited Italy and other parts of the continent of Europe. After his return to England he married Miss Caroline Curteis, whom he addresses as "Nea" in the "Verses written in a Churchyard," and whom he survived many years. His first volume of poetry, entitled "A Rhymer's Plea for Tolerance" (1833), was followed in 1838 by "Poems, for the most part Occasional." His last work was entitled "A Day at Tivoli, with other Verses." He used his large fortune with great generosity, and is said to have left legacies to 80 persons, many of whom were his old literary friends, including Barry Cornwall (£8,000) and Mr. and Mrs. Robert Browning (£10,000).

KENYON, LORD, lord, a British jurist, born at Gredington, Flintshire, Oct. 5, 1732, died at Bath in 1802. He was the son of a Welsh squire, and after a very imperfect education at a free grammar school was articled to an attorney at Nantwich in Cheshire. Being disappointed in his expectation of becoming a partner in the business of his master, he went to London in 1754, entered Lincoln's Inn, and in 1761 was called to the bar. He attended the courts at Westminster regularly, and went the North Welsh circuit, but at the expiration of 10 years was so little advanced in professional repute that he was desirous of taking orders if he could have obtained the presentation to a small living. At this juncture Dunning, who had been his fellow student, and who was now in the enjoyment of a lucrative practice, employed him as his "fag" or "devil;" and many hundred opinions written by Kenyon, and which Dunning never read, were signed by the latter as his own. As it gradually transpired that Dunning's opinions were prepared by Kenyon, the attorneys began to employ the latter, and cases with low fees soon came to him in large numbers. His rise out of his chamber seclusion was probably in consequence of some useful observations which he made as *amicus curiæ* in the presence of Lord Thurlow, then attorney-general, who thereafter promoted his advancement in various ways. To this powerful friend he owed his appointment to the chief justiceship of Chester. The sneers of Kenyon's rivals at this appointment incited his patron to push his fortunes still further. Although possessing no forensic reputation, he was in 1782 made attorney-general, and two years after master of the rolls, in which latter capacity he appeared to considerable advantage. Finally, on the retirement of Lord Mansfield, he was promoted by Pitt to the chief justiceship of the king's bench, with the title of Lord Kenyon, baron of Gredington. This appointment, which he held until his death, was not popular with the bar, and during his whole judicial career he was disliked for his overbearing disposition toward

his professional brethren, and his irritating and even insolent manners. On the other hand, he was in high favor with the public on account of the rigid impartiality of his decisions. He recognized no distinction of persons in his administration of justice, but rather exulted in an opportunity to inflict severe penalties upon the rich or titled. He was deeply learned in the law, and successfully resisted Lord Mansfield's attempts to bring about a fusion of law and equity. Outside of his professional range he was ludicrously ignorant. He accumulated by his professional labors a fortune of £300,000.

KENYON COLLEGE. See GAMBER.

KEOKUK, a S. E. co. of Iowa, drained by Skunk river; area, 576 sq. m.; pop. in 1859, 12,829. The surface consists partly of prairie, interspersed with groves of timber, and the soil is generally fertile. The productions in 1859 were 550,420 bushels of Indian corn, 24,481 of wheat, 5,255 of oats, 19,487 of potatoes, 9,977 tons of hay, and 15,179 galls. of molasses. Capital, Lancaster.

KEOKUK, a city and semi-capital of Lee co., Iowa, situated in the S. E. corner of the state, at the foot of the lower rapids of the Mississippi, and 2 m. above the mouth of the Des Moines, 205 m. above St. Louis, and 125 m. S. from Iowa City; pop. in 1850, 2,478; in 1857, about 12,000. It is built partly at the foot and partly on the summit of a bluff 150 feet high, which contains excellent limestone, and has broad regular streets with many handsome houses. It is the seat of the state medical college, a female seminary, and a number of academies. A public school edifice here, erected at a cost of \$13,500, is said to be the handsomest building in the state devoted to education. The city has 10 or 12 churches, and a large number of lumber and brick yards, mills, founderies, &c. Its manufacturing establishments in 1857 numbered about 50. It has an active and rapidly increasing commerce, and an incomplete table of its trade in 1856 gave the amount of goods sold as over \$5,000,000. The rapids in the Mississippi, extending 12 m. with a fall of 24 feet, render Keokuk the natural head of navigation at low water, but a canal around them capable of admitting large steamboats, and of affording a vast water power, has been projected. The city has most of the trade of the rich Des Moines valley, and is the terminus of two railroads, the Keokuk, Fort Des Moines, and Minnesota, finished as far as Bentonport, and the Keokuk, Mount Pleasant, and Muscatine, finished as far as Fort Madison. It has steamboat communication with St. Louis.

KEPLER, JOHANN, a German astronomer, born in Magstatt, near Weil, Wurtemberg, Dec. 21, 1571, died in Ratisbon, Nov. 15, 1630. He was a sickly child, and during his whole life suffered periodically from fevers and other ailments. His father, a man of noble origin and at one time a soldier in the Netherlands under the duke of Alva, having been reduced by the loss of his property to the condition of an inn-

keeper, young Kepler was during a portion of his childhood employed by him in a menial capacity. In 1586 he entered the monastic school of Maulbronn, whence he was transferred to the university of Tübingen, where in 1591 he took his degree of master. Subsequently he devoted himself to the study of astronomy under Möstlin, a disciple of Copernicus, and in 1594 was called to the professorship of mathematics in the university of Gratz in Styria. Here in the same year appeared his first publication, an almanac for 1595, followed in 1596 by his "Cosmographical Mystery," containing a fanciful theory regulating the order of the heavenly bodies, and which Hallam calls "a work mingled up with many strange effusions of a mind far more eccentric than any of the planets with which it was engaged." In 1597 he was married to a young widow named Barbara Muller von Mulech, and soon after, in consequence of domestic dissensions, and of religious troubles which threatened the safety of the Protestant professors in Gratz, of whom he was one, he was constrained to take refuge in Hungary. In 1600, learning that Tycho de Brahe was in Benach in Bohemia, he repaired thither, in the hope of availing himself of the Danish astronomer's observations on the eccentricities of the orbits of planets, and was received by him with great kindness. In the succeeding year he was presented by Tycho to the emperor Rudolph, who named him imperial mathematician, and employed him to assist Tycho in the preparation of a new set of astronomical tables, to be called the Rudolphine tables, intended to supersede those calculated on the Ptolemaic and Copernican systems. The emperor pledged himself to pay all the expenses of the work, and Kepler, to whom was assigned the task of examining the observations on the planet Mars, commenced his labors with enthusiasm. The death of Tycho shortly afterward disconcerted this scheme; and although Kepler succeeded him as principal mathematician, with a liberal compensation, he was thenceforth constantly involved in pecuniary difficulties, in consequence of the inability or neglect of the emperor to pay him the full amount of his salary. For this reason he was obliged to postpone the preparation of the Rudolphine tables, and devote himself to works of a less expensive kind; and such were the necessities of his family that he frequently eked out a subsistence by casting nativities. One of the first results of his altered circumstances was the production of his "Principles of Astrology" in 1602, a work little creditable to his speculative faculties, and in which he confesses his belief in the power of certain harmonious configurations of suitable planets to control human impulses. In his optical treatise, "A Supplement to Vitellio," published in 1604 at Prague, he appears to far better advantage; and although with all his scientific ardor and industry he was unable to discover the law of refraction, a subject that had greatly occupied his attention since the death of Tycho, he

was nevertheless singularly successful in his inquiries respecting vision, and first analyzed the whole scheme of nature in the structure of the eye. In this work he also described the mode of calculating eclipses which obtains at the present day. In his subsequent work on optics, entitled "Dioptrice" (Augsburg, 1611; reprinted in London, 1653), which, according to Sir David Brewster, "laid the foundation of the science," he explained the method of tracing the progress of rays through transparent bodies with convex and concave surfaces, and of determining the foci of lenses, and of the relative positions of the images which they form and the objects from which the rays proceed. Hence he was led to describe the astronomical telescope, having two convex lenses, by which objects are seen inverted. These discoveries, however, are obscured by the greatness of those announced in his "New Astronomy, or Commentaries on the Motions of Mars" (Prague, 1609), which were founded on the astronomical data prepared by Tycho. After many fruitless attempts to represent the orbit of Mars in a uniform circular motion, he discovered, by comparing together 7 oppositions of that planet, that its orbit is elliptical, whence he concluded that the orbit of each planet is an ellipse, with the sun placed in one of its foci. Having next ascertained the dimensions of the orbit of Mars, he found that the radius vector, or line joining the planet and the sun, described equal areas in equal times, and that the same was true of the other planets. These results constitute the first two of the three great laws of planetary motion known as Kepler's laws, the third having been discovered at a later period of his life. The labor and patience with which Kepler conducted these investigations will be best appreciated when it is considered that the calculations were made without the assistance of logarithms, which were a later invention, and that each calculation, of an opposition of Mars, filling 10 folio pages, was repeated 10 times, so that 7 oppositions produced a folio volume of 700 pages. In view of such difficulties, the remark of Prof. Playfair is particularly pertinent, "that the discoveries of Kepler were secrets extorted from nature by the most profound and laborious research." Notwithstanding the reputation which these brilliant discoveries gained for him, his worldly circumstances showed no signs of improvement. Not only did his arrears of salary remain unpaid, but the emperor Rudolph refused to allow him to accept the professorship of mathematics at Linz; and to add to his embarrassments, his wife died and his children were attacked by the small pox, which proved fatal to the eldest. Upon the accession of the emperor Matthias in 1612 he was allowed to accept the professorship at Linz, and 3 years later he was married for the second time, chiefly for the sake of his children, his own time being too fully occupied to enable him to look after their welfare. About the same time he presented to the diet at Ratisbon his views on the reformation of

the calendar, the substance of which he published in a short essay. In 1616 appeared his *Ephemerides* 1617-1620, the expense attending the preparation of which he confessed he had been obliged to defray "by composing a vile, prophesying almanac, which is scarcely more respectable than begging, unless from its saving the emperor's credit, who abandons me entirely, and would suffer me to perish from hunger." He nevertheless declined an invitation to fill the mathematical chair in Bologna, preferring poverty and the limited degree of freedom of speech and opinion he enjoyed in Germany, to the prospect of bettering his fortune in Italy. Between 1618 and 1622 appeared the 7 books of his "Epitome of the Copernican Astronomy," which was placed by the inquisition on the list of prohibited books; and in 1619 he published his "Harmonies of the World," dedicated to James I. of England, which is memorable in the history of science as containing the third of his celebrated laws, viz.: that the squares of the periodic times of the planets are proportional to the cubes of their mean distances from the sun. Such was the transport with which this discovery, which for 17 years had baffled all his skill and patience, filled him, that he marked the day and year, May 15, 1618, when it became known to him; and, speaking of the book which promulgated it, he said: "It may well wait a century for a reader, as God has waited 6,000 years for an observer." The accession in 1619 of the emperor Ferdinand II., who promised to pay the arrears of his salary, and to furnish the means of publishing the Rudolphine tables, seemed to open a more favorable era for the prosecution of his scientific labors; but such were the drains upon the imperial treasury caused by the religious wars which then convulsed Germany, that it was not until several years afterward that he was enabled to collect even a part of the sums promised him. In 1620 he was strongly urged by Sir Henry Wotton, the English ambassador at Venice, to take up his residence in England, but declined the offer. Finally in 1627, after more than a quarter of a century's delay and amid difficulties of all kinds, the Rudolphine tables were published in Ulm. They were the first ever calculated on the theory of the ellipticity of the planetary orbits, and are so remarkable a monument of patience and industry, that had Kepler done nothing more than compute them, he would be regarded as one of the benefactors of science. In 1629, for the sake of avoiding the religious disensions which distracted Linz, at the invitation of Wallenstein, duke of Friedland, he removed with his family to Sagan in Silesia, and soon afterward secured a professorship in the university of Rostock. In the following year he went to Ratisbon, and made a final but fruitless effort to obtain from the imperial assembly his arrears, which now amounted to 8,000 crowns. The vexation which this occasioned, combined with fatigue of mind and body, brought on a fever that proved fatal. His remains were interred in St. Peter's church-

yard, Ratisbon, and in 1808 a monumental temple to his memory was erected on the spot by the prince bishop of Constance.—The ardor and patience with which Kepler pursued science have found few parallels among modern philosophers. Ever prone to indulge in fanciful theories, he never lost sight of the precise object of his search, and ingenuously renounced any hypothesis that he could not reconcile with his advancing knowledge of phenomena. Of his manifold attempts in various branches of science Delambre says: "Those which have failed seem to us only fanciful, while those which have been more fortunate appear sublime." The history of science presents no discoveries more original, or which were deduced with so little assistance from the speculations of preceding philosophers, as his three celebrated laws, from which the discoveries of Newton subsequently sprung, thus completing the great chain of truths which constitute the laws of the planetary system. It is a sufficient evidence of his industry as an author that between 1594 and 1630 he published 83 works, beside leaving 28 volumes of manuscripts, 7 of which contain his epistolary correspondence. The latter was published in 1 vol. fol. in 1718, by Gottlieb Hansch; but the enterprise proving unsuccessful, he was obliged to part with the remaining volumes, which are now in the possession of the imperial library of sciences in St. Petersburg. Recently a complete edition of the works of Kepler has been undertaken by Charles Frisch, to include all his unedited manuscripts, of which the first volume appeared in 1858 (8vo., Frankfort and Erlangen).

KEPPEL, AUGUSTUS, viscount, an English admiral, born April 2, 1725, died in Suffolk, Oct. 2, 1786. He was the 2d son of William Anne Keppel, 2d earl of Albemarle, and entered the navy in 1740 under the auspices of Lord Anson, with whom he circumnavigated the globe. In 1744 he became a post-captain, and for many years rendered important services as commander of single ships or of squadrons, being almost uniformly successful in the expeditions he undertook. In 1762 he was promoted to be rear admiral of the blue; and in July, 1778, being then admiral of the red, and in command of a large fleet of ships of the line, he had an indecisive conflict with the French squadron under D'Orville off Ushant. The British fleet having hauled off to repair damages, a signal was given by the admiral to renew the battle; but the failure of Sir Hugh Palliser, who commanded the rear, to obey it, enabled the French to escape. Palliser subsequently brought articles of accusation against Keppel, which upon investigation by a court martial were declared unfounded, while the conduct of Keppel was pronounced such as became a prudent and brave officer. The acquittal of the admiral, who was very popular, excited the most enthusiastic demonstrations of joy, and bonfires and illuminations celebrated the event. He was subsequently at different times first lord of the

admiralty, and in April, 1782, was created Viscount Keppel of Elvedon in Suffolk, having for many years previous been a member of the house of commons.

KEPPEL, GEORGE THOMAS, an English soldier and politician, born in 1799, was at the battle of Waterloo, became one of the secretaries of Lord John Russell in 1846, and sat in the house of commons, in the interest of the liberal party, from 1882 to 1885, and again from 1847 to 1852. He has written "Journey across the Balkan," "Journey from India to England," &c.—HENRY, brother of the preceding, born June 14, 1809, entered the navy, commanded one of the vessels of the expedition against China in 1842, and assisted Sir James Brooke in Borneo. He has written "The Expedition to Borneo of H. M. S. Dido," and "A Visit to the Indian Archipelago in H. M. S. Mæander," both of which contain extracts from Brooke's diary.

KERATRY, AUGUSTE HILARION DE, a French author and statesman, born in Rennes, Oct. 28, 1769, died in Dec. 1859. He was of a noble family, studied at Quimper, was destined to the law, declared in 1789 in favor of the revolutionary ideas, wrote various romances, was a liberal under the restoration, after the revolution of 1830 was called to the council of state, became a peer in 1837, opposed Ledru-Rollin in 1848, and presided over the legislative assembly in 1849 as the oldest member, and pronounced a violent discourse against republicanism. The *coup d'état* of Dec. 2, 1851, terminated his political career. Among his later writings are: *Du beau dans les arts d'imitation* (1822); *Examen philosophique de Kant* (1823); *Le dernier des Beauvauoir* (1824); and *Saphira, ou Paris et Rome sous l'empire*.

KERMAN, or KIRMAN, a province of Persia, between lat. 26° 30' and 31° 20' N., long. 54° 30' and 60° 20' E., bounded N. by Khorassan, E. by Afghanistan and Beloochistan, S. by the Persian gulf, and W. by Laristan and Fars; area, 65,000 sq. m.; pop. about 600,000. It is intersected from E. to W. by a mountain chain called Djebel Abad. To the N. of this chain the country, with the exception of the district of Noormansheer, is a barren wilderness; to the S. of it, generally an alpine region of alternate hill and vale. The valleys and some of the plains are fertile. The white rose is extensively cultivated for its attar, and the mulberry tree for the breeding of silkworms. The chief manufactures are woollen cloths, carpets, goats' and camels' hair shawls, coarse linens, and matchlocks. The most important minerals are iron, copper, and sulphur. The inhabitants of the sea coast are mostly engaged in fishing, but the pearl fishery, which once employed a considerable portion of them, is no longer prosecuted.—The capital, KERMAN (pop. 30,000), was once the most important city in Persia, and the great centre of trade between the Persian gulf and the inland regions; but since the rise of Bushire it has declined.

KERMANSHAH, a town of Persia, capital

of the province of Koordistan, situated on the S. W. declivity of a mountain range, 80 m. W. S. W. from Hamadan, in lat. 34° 30' N., long. 47° 12' E.; pop. about 30,000. It is surrounded by an earthen wall nearly 3 m. in circumference, and is said to be a flourishing town. In the neighborhood are the celebrated rock inscriptions of Behistun.

KERMES INSECT. See COCHINEAL.

KERMES MINERAL, a precipitated sulphuret of antimony, formerly in great repute as a medicine. The secret of its preparation was purchased in 1720 by the French government and made public. It is prepared either in the dry or wet way by treating the tersulphuret of antimony with carbonated soda or potash. The French process is to boil one part of the pulverized antimony with 23 parts of crystallized carbonate of soda in 250 parts of water for half an hour, and after filtering allow the liquor to cool slowly in covered earthen pans. The kermes subsides in 24 hours. It is then collected on a filter, washed with boiling water, cooled while protected from the air, and dried at a temperature of 77°. It is a reddish brown insoluble powder, without taste or slightly styptic. It is used in medicine as an alterative, diaphoretic, and emetic; as an alterative, usually in combination with calomel and guaiacum in the form of Plummer's pill; and conjoined with henbane or hemlock in chronic rheumatism.

KERNER, ANDREAS JUSTINUS, a German poet and physician, born in Ludwigsburg, Württemberg, Sept. 18, 1786. After completing his school education he served an apprenticeship in a cloth factory. In 1804 he went to the university of Tübingen, where he studied medicine and formed an intimacy with the poet Uhland. After some years of preliminary practice he settled in 1813 in the little village of Weinsberg, where he passed 33 years. His residence, at the foot of the romantic old ruins of Weibertreue, became a favorite resort of the Swabian poets. Some of his lyrics, for which Schumann has written melodies, have attained a popularity scarcely inferior to those of Uhland. Complete editions of his poems were published in 1826 and 1843, and a later collection at Stuttgart in 1853 entitled *Der letzte Blütenstrauss*. He has been a close investigator of the phenomena of animal magnetism and somnambulism, and among the results of his observations is a remarkable book, *Die Scherin von Prevorst* ("The Seeress of Prevorst"), translated into English by Mrs. Catharine Crowe. He has written a number of other books on the same subject. Having been obliged in 1851 to resign his profession from a total loss of sight, he received a pension from the king of Württemberg, and also one from the ex-king Louis of Bavaria.

KERR, a W. co. of Texas, watered by Guadalupe and Medina rivers; area, 1,172 sq. m.; pop. in 1858, 682, of whom 54 were slaves. The surface is diversified, and much of the soil of superior quality. The principal productions are Indian corn, wheat, and cotton. Capital,

Kerrsville. Value of land in 1859, \$69,946. The country was organized in 1856.

KERRY, a maritime county in the S. W. of Ireland, province of Munster, bounded N. by the estuary of the Shannon, E. by Limerick, S. by Cork, and W. by the Atlantic ocean; area, 1,853 sq. m.; pop. in 1851, 238,289, of whom a considerable proportion speak only the Irish tongue. The coast is much indented with bays and inlets, the principal being Brandon, Valentia, Kenmare, Dingle, Tarbert, and Tralee bays. Numerous small islands lie off the coast. The chief rivers are the Feale, Mang, Laune, and Boughy. Many beautiful lakes are hidden among the hills, including the famous lakes of Killarney, the two lakes of Carra, Currane, Derryana and Lanan, and the Devil's Punch Bowl near the summit of Mangerton. The surface in the N. is open and undulating, in the S. W. wild and mountainous. The hilly region contains some of the highest summits in Ireland. Minerals have been but partially explored, yet copper, marble, and roofing slate are worked, and lead and iron are known to exist. Agriculture is in a backward condition. The soil is mostly inferior, except in the central lowlands, where it consists of a rich loam, resting on limestone. The climate is the mildest in Ireland. The fisheries of the Kerry coast are of importance. Chief towns: Tralee, Killarney, Dingle, Listowel, Cahirciveen, and Kenmare. The county returns two members to parliament, beside one for the borough of Tralee.

KERSHAW, a N. district of S. O., drained by Wateree river and Lynche's, Little Lynche's, Rice, and Pinetree creeks; area, 756 sq. m.; pop. in 1850, 14,473, of whom 9,578 were slaves; white pop. in 1859, 5,508. It has a hilly surface. The soil of the uplands is sandy, but susceptible of profitable cultivation, and the river bottoms are remarkably fertile. Cotton is the staple export. A gold mine, once considered the richest in the state, is worked on Little Lynche's creek. The productions in 1850 were 9,015 bales of cotton, 362,165 bushels of Indian corn, 23,510 of oats, 54,880 of sweet potatoes, and 74,675 lbs. of rice. There were 2 saw mills, 1 grist mill, 1 newspaper office, 13 churches, and 340 pupils attending public schools. Capital, Camden.

KERTCH (anc. *Panticapæum*), a city of the Crimea, situated on the straits of Yenikale, commanding the entrance to the sea of Azof, lat. 45° 20' N., long. 36° 28' E., 130 m. E. N. E. from Simferopol; pop. in 1853, 10,000; now about 19,000. The place as it now stands is of recent date. It is handsomely built of stone, with wide and regular streets. It has been a free port since 1827, and is rapidly growing. The inhabitants are mostly engaged in commerce. The exports are building stone, soap, candles, salt in large quantities, with herrings and sturgeon, the produce of the coast fisheries. The government has a foundery and ship yard here. The harbor is good, and is fortified.—Panticapæum was for more than 800 years, down to about A. D. 350,

the capital of the ancient kingdom of Bosphorus Cimmerius, and was itself sometimes called Bosphorus. The Genoese colonized it in the 14th century under the name of Vospro; and it is still called Bosphor by the Crimeans. Russia obtained it from the Turks in 1774 by the treaty of Kainarji, and gave it the name of Kertch. In 1855-'6 it was in the hands of the British, by whom the museum, containing valuable remains of antiquity, was destroyed. There are numerous tumuli in the vicinity, and recent excavations have brought to light the supposed burial place of the Scythian kings.

KERVYN DE LETTENHOVE, JOSEPH MARIE BRUNO CONSTANTIN, a Belgian historian, born in St. Michel, Aug. 17, 1817. He is the author of an excellent history of Flanders (*Histoire de Flandres*, Brussels, 1847-'50), and of various other historical works. He has prepared a translation of Milton's select works, and written an essay on Froissart's "Chronicles" (*Étude sur les chroniques de Froissart*), crowned by the French academy in 1856.

KESTREL, a European falcon, of the genus *tinnunculus* (Vieill.), much resembling the American sparrow hawk. This bird (*F. alaudarius*, Brisson) has the form and proportions of the falcons proper, except that the tarsi are longer and the toes less stout. The length is about 14 inches, and the extent of wings 28, the female being a little larger than this; the closed wings are about 9 inches shorter than the tail. In the male, the general color above is light grayish blue, the back and wing coverts pale red with triangular dark spots; the tail with a subterminal broad black bar; the lower parts light yellowish red, with longitudinal dark lines and spots. In the female, the upper parts are light red, with transverse dark bars and spots; the young resemble the female. The kestrel hovers in search of prey at a height of 30 or 40 feet, from which it pounces upon small birds, mice, moles, reptiles, and sometimes worms and beetles, which it finds in the open fields; from its peculiar manner of hovering, it has received the popular name of wind-hover; it occasionally pursues birds in open flight. When not in search of food, the flight is high, with rapid flaps and occasional sailings. Silent when hovering after prey, it is very noisy in the breeding season; it breeds on cliffs near the sea, in trees in the woods, in ruined buildings or high towers in towns, and in the deserted nests of the crow family; the eggs, 3 to 5, are reddish white, with irregular dots and patches of dull brownish red. This is one of the most common birds of prey in Great Britain, in almost all districts except the interior heaths. When taken from the nest, kestrels may be trained to pursue quails, snipes, larks, and birds of similar size. Their numbers are greatly diminished during winter, and they are said to migrate to northern Africa. Though persecuted by gamekeepers, often for the sins of the sparrow hawk, it is of positive benefit to man by destroying great numbers of mice. It is found

throughout Europe. There is a smaller kestrel (*T. cenchris*, Naum.), with longer wings and fewer spots, in eastern and southern Europe. The kestrel swallows small mammals whole, but removes the feathers from its bird prey. There is considerable variation in the plumage.

**KESWICK**, a market town of Cumberland, England, on the S. bank of the Greta, 24 m. S. S. W. from Carlisle; pop. in 1851, 2,618. It is well built, contains 2 museums, chiefly of minerals, and has manufactures of linsey-woolsey stuffs, cutlery, and black lead pencils. Lying within one mile of the foot of Skiddaw and half a mile from Derwentwater, it is much resorted to by tourists, for whose accommodation there are several hotels. The vale of Keswick is renowned for its picturesque scenery, in respect to which it is surpassed by few spots in England. Greta Hall, late the residence of the poet Southey, is near the town.

**KETOH**, a name formerly applied to a small armed vessel of 2 masts and from 100 to 250 tons burden, used chiefly to convey distinguished persons from place to place. It was nearly the same as the modern yacht.

**KETOH, JACK**, a cant term applied in England to the hangman at public executions. Previous to 1642 the hangman appears for a number of years to have borne the name of Gregory. The present name was derived either from a real person, Jack Kitch, who bequeathed it to his successors; or, with more probability, from Richard Jacquett, who held the manor of Tyburn, near London, where criminals were formerly executed.

**KEW**, a village and parish of Surrey, England, on the S. bank of the Thames, 7 m. W. from London, famous for the royal botanic gardens, comprising 75 acres, and open gratuitously to the public daily, including Sunday. They contain a palm house 862 feet long, 100 feet wide, and 64 feet high, houses for cacti, tanks for the *Victoria regia* water lily, and a most extensive collection of Australian trees and plants. The old palace of Kew was the residence of George III. and his family. The surrounding pleasure grounds cover an extent of 245 acres, tastefully laid out. The number of visitors to Kew gardens was 179,627 in 1850, 827,900 in 1851, 281,010 in 1852, 381,210 in 1853, 889,164 in 1854, 813,816 in 1855, and 844,140 in 1856.

**KEWAUNEE**, an E. co. of Wis., bordering on Lake Michigan and drained by Kewaunee and Red rivers; area, 360 sq. m.; pop. in 1855, about 1,100. It has a rolling surface and a fertile soil, and is well wooded. It was organized in 1852. Capital, Kewaunee.

**KEY, FRANCIS SCOTT**, an American lawyer and song writer, born in Frederic co., Md., Aug. 1, 1779, died in Baltimore, Jan. 11, 1843. He was educated at St. John's college, Annapolis, and commenced the practice of the law in Frederic City. Subsequently he removed to Washington, where he was for many years district attorney of the district of Columbia. As a song writer he is chiefly known by his "Star-Span-

gled Banner," a popular national lyric, suggested and partially written while the author was detained in the British fleet during the bombardment of Fort McHenry, near Baltimore, of which he was an anxious and interested witness. A posthumous collection of his miscellaneous poems was published in New York (1856).

**KEY WEST** (Sp. *Cayo Hueso*, Bone Key), the most westerly of the Pine islands in the chain known as the Florida keys, 60 m. S. W. from Cape Sable, about the same distance E. from the Tortugas, and 100 m. N. N. E. from Havana. It is about 6 m. long and 2 m. broad, and nowhere more than 12 or 15 feet above sea level. It is of coral formation, and has a sandy, sterile soil, but in the few spots which are arable the vegetation is rich. The greater part of it is covered with copsewood or low bushes. There are some vegetable gardens, the productiveness of which is never entirely checked at any season, though greatest in winter. The climate is well adapted to tropical fruits. There is an artificial salt pond on the island, 850 acres in extent. On the S. W. point there is a lighthouse with a fixed light 67 feet above water; there is another of iron on Sandy key, 11 m. S. S. W.; a third on the N. W. passage, showing a fixed white Fresnel light, 40 feet above water; and a light ship anchored on the reef at the W. entrance to Key West harbor. Notwithstanding these precautions, the locality is constantly the scene of disastrous shipwrecks.—**KEY WEST CITY**, on the preceding island, the capital of Monroe co., Fla., and the southernmost settlement belonging to the United States, is situated in lat 24° 32' N., long. 81° 48' W.; pop. in 1860, about 8,000. It has a fine harbor, accessible through several channels by vessels drawing 22 feet of water. Being the key to the best entrance to the gulf of Mexico, it is strongly fortified. The principal work of defence is Fort Taylor, built on an artificial island within the main entrance to the harbor. The barracks are large and commodious buildings, forming 3 sides of a quadrangle, the opening facing the sea. The streets of the city are wide and clean; the houses, generally of the cottage style, are neat and often embosomed in shrubbery. There are Baptist, Episcopal, Methodist, and Roman Catholic churches, a well arranged marine hospital 100 feet long by 45 feet wide, a custom house, a court house, and other public buildings. Salt is manufactured to the extent of about 80,000 bushels annually; fish and turtle are caught in great abundance; and the neighboring reefs abound in sponges, which are gathered and exported to the value of about \$50,000 yearly. The principal occupation of the inhabitants is wrecking, which, though improperly associated in many minds with piracy, fraud, or violence, is a legitimate business, regulated by peculiar laws, and carried on for the mutual benefit of the owners and wreckers. Many of these latter bear a high character for honesty, generosity, and enterprise. Their vessels are licensed by the judge of the

district court of the United States resident at Key West; they are generally large sloops or schooners, each carrying a crew of 8 or 10 persons, who are remunerated by shares of the profits of the business. The amount of salvage is determined by the admiralty court; one half goes to the owner of the vessel, who fits her out and furnishes materials, provisions, &c.; the other half is divided into shares, of which the captain takes 3, the mate 2, and each of the crew one. In 1858 there were 47 of these licensed wrecking vessels at Key West, averaging 50 tons each, but about half of them are also engaged in fishing. The following table shows the disasters to shipping in the wrecking district of Key West for a series of 5 years:

Years.	No. of vessels.	Salvages.	Expenses.	Value of vessels and cargoes.
1854.....	64	\$88,940	\$186,865	\$2,814,000
1855.....	80	100,485	189,800	2,844,077
1856.....	71	163,117	262,644	4,797,609
1857.....	59	101,580	172,984	2,663,450
1858.....	52	141,573	109,778	2,692,000
Total.....	326	\$396,014	\$901,571	\$15,811,127

Key West was made a port of entry in 1822, soon after its first permanent settlement. During the year ending June 30, 1859, its commerce was as follows: imports, \$270,475; exports, \$195,755; vessels entered, 121, tonnage 42,561; vessels cleared, 94, tonnage 14,647; registered and licensed tonnage of the district, 7,641.—A large proportion of the population of Key West consists of natives or children of natives of the Bahama islands. They are generally known as Conchs, and are a hardy and adventurous race, remarkable for their skill in diving, which is often called into requisition in recovering the cargoes of sunken vessels. It is said that they frequently secure articles at a depth of 40 or 50 feet, or even more. The climate is considered exceedingly healthy. The thermometer ranges from 50° to 90° F., and the atmosphere is remarkably pure. Lying however in the track of the great hurricanes of the West Indies, the place has suffered repeatedly from violent storms of this description, the most disastrous on record being that of Oct. 11, 1846. A large part of the town was destroyed by fire, May 16, 1859. An area of 20 acres was burned, more than 100 buildings were consumed, and the loss of property was estimated at \$2,750,000.

KEYS, HOUSE OF. See OLIVES INSULAR.

KEYS OF FLORIDA, a chain of low, sandy islands, reefs, and sand banks on the S. coast of Florida, extending from the neighborhood of Cape Florida, in a S. W. and W. direction, for more than 200 miles, and forming a curve with its convexity to the S. They are exceedingly numerous, and render the navigation of the straits of Florida very dangerous. The most noted of the Florida keys are Key West and the Dry Tortugas.—The term "key" is derived from the Spanish word *cayo*, an islet, and is applied to a great many small islands in the West Indies and on the coast of Florida. (See FLORIDA.)

KEYSER, NICAISE DE, a Belgian historical painter, born in Sandvliet, province of Antwerp, in 1813. He is the son of a peasant, and was enabled by the generosity of a lady who recognized his talents to pursue his studies at the academy in Antwerp. His first picture was a "Christ on the Cross," painted in 1834, for a Roman Catholic church in Manchester, England. His works consist chiefly of battle pieces and serious historical subjects, though he has latterly given his attention to pictures of *genre*.

KHALKAS, a tribe of Mongols, inhabiting an extensive region of Outer Mongolia, bordering on Siberia on the N. and Chinese Tartary and Soongaria on the W. Their country extends about 600 m. N. and S. and 1,500 E. and W. It is divided into 4 provinces, Tsaiten, Tushitoo, Dsassaktoo, and Sain, governed by khans who acknowledge the spiritual authority of the Guison-Tamba, or Grand Lama, and are nominally feudatory to the Chinese emperor. Beyond an occasional journey of ceremony to Peking, however, these chieftains pay few or no marks of allegiance. There are also some scattered tribes in the Russian dominions, and there is one on the borders of Lake Koko Nor. The residence of the Guison-Tamba is at the lamasery of the Great Kooren, on the N. bank of the river Toola; 80,000 lamas inhabit this place, and near by there is a commercial station of Chinese, where an active trade is carried on with the Russians. The court of Peking maintains several mandarins at the lamasery, ostensibly to look after the interests of the traders, but in reality as spies upon the Guison-Tamba, whose influence is much feared by the emperor. The Khalkas are the richest and most numerous of the Mongol tribes, and the most celebrated in history. The famous Genghis Khan belonged to this tribe.

KHAN, a Tartar word signifying sovereign or chief. It is used by sovereign princes in all the Tartar countries, and is one of the titles of the Turkish sultan. The title khan is given in Persia to officers of various grades, but is generally expressive of high rank, and is especially applied to the chiefs of the nomade tribes of that country.—Khan is also the Turkish word for caravansary or hotel. Of these edifices there are 180 in Constantinople. They are commonly built in the form of a square, with an interior court surrounded by three ranges of galleries, one above another, from which open small unfurnished chambers which travellers are permitted to occupy without charge, except a small present when departing to the servant who has charge of the rooms. These khans have mostly been constructed at the expense of the sultans, though some have been founded by munificent wealthy private individuals.

KHANDEISH. See CANDEISH.

KHARKOV, a government of European Russia, province of Ukraine, bounded N. by Kursk, N. E. by Voronej, E. by the land of the Don Cossacks, S. by Ekaterinoslav, and W. by Pultowa; area about 17,500 sq. m.; pop. about

1,500,000. It has an elevated but flat and monotonous surface, partly covered with forests, and a fertile soil, which is generally loamy and here and there sandy. It is traversed by the Donetz, the Oskol, its chief tributary from the N., and various other streams. None of these, however, are navigable for any considerable distance. The chief vegetable productions are the various species of grain, flax, hemp, tobacco, hops, and potatoes. Beside agriculture, the rearing of cattle (which are excellent), horses, and bees, forms the principal occupation of the inhabitants, who are for the most part Little-Russians and Cossacks. The government is divided into 11 districts.—The capital, of the same name, is situated at the confluence of the Kharkovka and Logan, lat. 50° N., long. 36° 26' E.; pop. about 27,000. It is poorly built, mostly of wood, but contains a number of large public buildings, has a considerable trade, and can boast of one of the few universities Russia possesses. The latter, which was founded in 1804 by Czar Alexander I., is endowed with various scientific collections. Kharkov is also the see of an archbishop.

**KHARTOOM**, a town of Sennar, the chief seat of the Turkish-Egyptian dominion on the upper Nile, situated on the W. bank of the Bahrel-Azrek or Blue Nile, nearly at its junction with the White Nile; lat. 15° 40' N., long. 32° 38' E.; pop. about 80,000. The houses are mostly constructed of millet stalks, and scattered over a wide area. The principal public edifices are the mosque, military hospital, and bazaar. The chief objects of traffic are slaves, gold, ivory, gums, medicinal plants, ostrich feathers, coffee, and giraffe and leopard skins, all brought from the interior by caravans or boats; and cloths, cottons, saddles, bridles, tea, sugar, soap, shoes, crockery, and hardware from Europe *via* Alexandria and the Nile. The climate of Khartoom is unhealthy. Its inhabitants are a mixed race of Berbers, Arabs, and negroes, with a few Turks, Jews, and Europeans. The town is of recent growth, having sprung up since the conquest of Nubia and Sennar by the troops of Mehemet Ali.

**KHATMANDOO**. See **CATMANDOO**.

**KHEMNITZER**. See **CHEMNITZER**.

**KHERASKOFF**, **MIHAIL**, a Russian poet, born Oct. 25, 1733, died in Moscow, Sept. 27, 1807. He served in the army, and subsequently held various civil offices, being at one time director and curator of the Moscow university. He was a copious writer in prose and poetry, and the author of several tragedies, comedies, odes, epistles, &c.; but he is now remembered only as the author of the "Rossiad" (Moscow, 1785), an epic in 12 cantos on the conquest of Kasan by Ivan the Terrible; and of the "Vladimir" (Moscow, 1786), in 18 cantos, on the conversion to Christianity of the czar and saint of that name. Regarded as the Homer of Russia in his time, he is now placed far below the first rank of Russian poets.

**KHERSON**. See **CHERSON**.

**KHIVA**, **CHIVA**, **KHARESM**, or **ORGUNJE** (and

*Chorasnia*), a country of Independent Tartary, lying between lat. 36° and 45° N., long. 52° and 64° E., bounded N. by the Kirgheez steppe and the sea of Aral, E. by Bokhara and the Kizilkum desert, S. by the Persian province of Khorassan, and W. by the Caspian sea; area, about 150,000 sq. m.; pop. estimated at 2,000,000. It consists mostly of sandy deserts, with a narrow strip of fertile land along the river Jihoon (the ancient Oxus), comprising about 10,786 sq. m. of arable land, under the general name of "the oasis of Khiva," of which only  $\frac{1}{4}$  is under cultivation. Its products are grain, fruits, flax, cotton, and madder, with some hemp. Considerable skill is exhibited in agriculture, and Khiva is the only country of central or western Asia which contains a great number of single farming establishments. Cotton is grown extensively. Sheep and goats are raised rather than cattle; the horses are of fine breed; dromedaries are the beasts of burden. Gold is conjectured to exist in the Sheik-daheli mountains, which run parallel with the Jihoon river, from lat. 40° 35' to 42° 30', their geological structure resembling that of the Ural mountains. The population are Soonnite Mohammedans of mixed race. The nomadic tribes are Truchmenes, Karakalpaks, and Kirgheez. The Usbecks, to whom the khan belongs, are the dominant race. They hold considerable numbers of slaves, the city of Khiva being the great slave mart of Independent Tartary. Shawls and other fabrics for export are woven by the women. Caravans annually convey agricultural produce, silk, cotton, &c., to Orenburg, Astrakhan, and Cabool, to be exchanged for Russian and western goods. The khan is despotic; his title is Taksir-khan; he receives two tomans of tax annually from each family, thereby obtaining a revenue of over \$1,250,000 per annum, in addition to the profits of traffic in slaves and imposts on caravans. His standing army numbers from 15,000 to 30,000 horsemen.—Khiva was probably a part of ancient Bactria. From the 8d to the 10th century it was connected with Persia. It became afterward an independent kingdom under the name of Khowarism or Kharizin, until conquered by Genghis Khan at the beginning of the 13th century. At the end of the 14th it was taken by Timour, and remained part of the kingdom of Samarcand until the beginning of the 16th century. Eventually it came under the rule of the Usbecks, a Turkish tribe, who founded the khanat or kingdom of Khiva. Peter the Great sent an army under Gen. Bekevitch against the Khivans in 1717, which was defeated. Since that time the khans have taken every opportunity to display hostile feelings against Russians. Prominent among the recent khans, for his military skill and wise administration, was Rahini (1802–26). His successor, Rahman Kuli, made himself particularly obnoxious to the government of the czar by his cruel treatment of Russian prisoners and by his favoring English influence. An army of 20,000 men and 10,000 camels set

out from Orenburg in Nov. 1839, under Gen. Perovski; but most of the troops and animals succumbed to the rigor of the climate before they had far advanced in their journey through the Kirghee country, and Perovski was compelled to return to Orenburg in Jan. 1840, with the few survivors of the disastrous expedition. Through the interposition of England the Russian prisoners were afterward set free by the khan, who died in 1846. He was succeeded by his brother Babad, and the latter was recently succeeded by Ali Kuli Khan. A treaty concluded by the czar with the khan in 1854 is regarded as very favorable to the influence of Russia. A narrative of the journey of Major Blankennagel to Khiva appeared in the bulletin of the geographical society of St. Petersburg in 1858, with remarks by Grigorieff. The writer speaks in glowing terms of the mineral wealth and of the general resources of Khiva, and surmises that it will become an important place for the transit trade of Russia with India.—KHIVA, the capital, is situated on a cultivated plain near the river Jihoon, in lat.  $41^{\circ}40'N.$ , long.  $59^{\circ}18'E.$ ; pop. 18,000. It is surrounded by walls, enclosing an area of 4 sq. m., and consists mostly of adobe huts. The goods sold in its bazaar are English, Russian, and inland cotton cloths, silk shawls, silk handkerchiefs, inferior Russian cloth, pottery, sugar (which is imported from Russia), tea, needles, and cutlery. The cold is often so intense in Khiva as to freeze the Jihoon completely over.

KHOKAN, or KOKAN, a country of Independent Tartary, lying between lat.  $40^{\circ}$  and  $45^{\circ}N.$ , long.  $67^{\circ}$  and  $75^{\circ}E.$ , bounded N. by the country of the Kirghee, E. by Chinese Tartary, S. by Bokhara, and W. by the Karakalpak territory; pop. about 3,000,000, mostly Usbeck shepherds and wandering Kirghee tribes. The surface is covered with the mountains of Ala Tagh, Karataon, Kashgar Divani, and their ramifications, forming the W. buttress of the great tableland of central Asia. The river Sihon flows N. W. through the country, receiving numerous branches in its course to the sea of Aral. Along the rivers the soil is fertile; elsewhere it is thin and sterile. The summer heat is excessive, and the winters are proportionately cold. Pasturage is the leading occupation, as cattle, sheep, horses, and camels constitute the chief wealth, but grain and fruits are raised. Cotton, silk, and wool are staples of the country; the silk is especially valuable. Trade is carried on with various Russian towns, Chinese Tartary, Bokhara, and Budukshan. Large timber is found, as are gold and silver in small quantities, copper, iron, lapis lazuli, jasper, and coal. The people are well formed, fair complexioned, quiet, and hospitable to strangers. The authority of the khan was until a recent period confined to a small district in the upper valley of the Sihon, but it has spread by conquest to its present dimensions.—KHOKAN, the capital, is situated in a fertile and well cultivated valley on the Jaxartes, 280 m. N. E. from Samarcand; pop. 50,000. It is built

of adobe, with mosques, bazaars, and caravansaries. It supplies the Kirghee with silk, and Bokhara with cotton fabrics. Caravans between the capitals of Khokan and Bokhara occupy 45 days on the journey.

KHOOZISTAN, or KHUZISTAN (anc. *Susiana*), a province of Persia, bounded N. by Looristan, E. by Irak-Ajemea, S. E. by Fars, S. by the Persian gulf, and W. by Asiatic Turkey, and lying between lat.  $30^{\circ}$  and  $34^{\circ}N.$ , long.  $46^{\circ}$  and  $51^{\circ}E.$ ; area estimated at 25,677 sq. m.; pop. 900,000. Its surface is hilly, the Bakhtiyari mountains rising on its N. E. frontier, and lesser eminences being scattered over the N. part of the province. In the S. it is more level. The Tigris and Euphrates form part of its W. boundary, the latter river after its junction with the former being here known as the Shat-el-Arab. Several of the branches which form its delta empty into the Persian gulf through this province. The principal rivers which traverse the interior are the Kerah and the Karoon. Khoozistan contains extensive grazing lands on which vast herds are pastured, and produces rice, maize, barley, cotton, sugar cane, dates, and indigo. The silk worm is reared, and trade is carried on with Bagdad, Bassorah, and other places. Its principal towns are Shooster, Dezfool, Behbak, and Mohammerah. The inhabitants are Tajiks, Sabian Christians, Loora, Erdelana, and Araba, all of whom, except the Sabians, are Mohammedans. The province contains the ruins of Susa, one of the ancient capitals of Persia.

KHORASSAN, or KHORASAN, a province in the N. E. of Persia, between lat.  $31^{\circ}30'$  and  $38^{\circ}20'N.$ , long.  $53^{\circ}10'$  and  $61^{\circ}20'E.$ , bounded N. by Khiva, E. by Afghanistan, S. and W. by the Persian provinces of Kerman, Farsistan, and Irak-Ajemea; area, 138,936 geographical sq. m.; pop. 2,000,000. Of the surface, 40,000 sq. m. are covered by the great salt desert, called by the natives Kubeer. The fertile districts are the N. W. and N. E., with numerous oases, mostly of small extent, but containing several populous towns. The mountains of Elbroos stretch along the N. of the province, and throw off ramifications to the southward. The products of the cultivated districts are grain, cotton, hemp, tobacco, aromatic plants, and drugs, among them asafoetida, manna, and gum tragacanth. Manufactures are silk, woollen, and goats' hair stuffs, carpets, muskets, and sword blades. Mushed is the capital of the province, and the other chief towns are Tabas or Tubus and Nishapoor. About 40 m. N. W. from Nishapoor are famous turquoise mines. Two thirds of the inhabitants are Persians, resident in towns, the remainder being nomadic Turcomans and Koords. The prevalent religion is Mohammedanism of the sect of Ali. The Russian government has sent a scientific expedition to Khorassan, which arrived there at the beginning of 1858, under the direction of Mr. Khanikoff.

KIAKHTA, or KIAOKTA, a Siberian town, near the Chinese frontier, in the Russian government of Irkootsk, lat.  $50^{\circ}20'N.$ , long.  $121^{\circ}$

40' E., about 100 m. S. from Lake Baikal, on a small stream of its own name, 2,500 feet above the level of the sea; pop. about 5,000. It consists of the fortress, called Troitskoi Sawsk, where the custom house and the government buildings are established, and of the lower town or town proper, where the merchants live, many of them in elegant houses. Kiakhta is the great emporium of trade between Russia and China, the Chinese settlement Maimachin being about 1 m. from the lower town. The trade has been of great importance since 1727, when a free commercial intercourse was established between China and Russia, to be carried on at the common boundary on the river of Kiakhta; but the privileges of the Chinese merchants were curtailed by their being prohibited from building storehouses on the frontier and bringing their wives to reside with them at the mart on the borders. Fairs are held annually, when large caravans of Russians and Chinese meet to barter Russian furs, cattle, lambskins, broadcloths, coarse linen, woollen goods, iron ware, butter, &c., for Chinese silks and other goods, and especially tea, a great amount of which is forwarded for sale to the fair of Nijni-Novgorod. The total value of the trade between Russia and China passing through Kiakhta is estimated at over \$8,000,000. There are several places of worship and a Bible society in the town. Erman, in his "Travels in Siberia," says of Kiakhta: "The entrance of this well known frontier town is just like that of a German village. A Cossack keeps guard, with his drawn sword, to prevent any article of merchandise passing in or out unless by a written permit from the custom house. Chinese traders meet us at every step. They were all hurrying over the boundary line, for every Chinese is obliged to be in Maimachin before sunset. We followed the crowd that was pressing forward toward a narrow door in the front of a long wooden building. This admitted us into the inner quadrangle of a Russian warehouse, where merchandise is stored and disposed of by wholesale, but not exposed to view. A corresponding door at the opposite side of this court opens just upon a wooden barricade, which constitutes the barrier of China. In this there is a wide portal, ornamented with pillars and displaying the Russian eagle above it, along with the cipher of Nicholas I., by whom it was erected. The change upon passing through this gate seemed like a dream, or the effect of magic; a contrast so startling could hardly be experienced at any other spot upon the earth. The unvaried sober hues of the Russian side were succeeded all at once by an exhibition of gaudy finery, more fantastic and extravagant than was ever seen at any Christmas wake or parish village festival in Germany. A peculiar and distinct dialect of the Russian language may be said to have grown up at Kiakhta from the intercourse with the Chinese."

KIDD, WILLIAM, an American pirate, born about the middle of the 17th century, executed in London, May 24, 1701. He appears to have

followed the sea from his youth, and about 1695 was known as one of the boldest and most successful shipmasters that sailed from New York. At this time the depredations of pirates upon British commerce had become so extensive that a company was organized in England, in which William III. and several noblemen were shareholders, to fit out an armed vessel for the purpose of suppressing the practice, as well as of deriving a profit from recaptures. At the suggestion of Col. Richard Livingston of New York, Kidd, who had obtained some experience as captain of a privateer against the French, received a commission signed by the king, and directed to "the rusty and well beloved Captain Kidd, commander of the ship *Adventure Galley*," a vessel of 30 guns. Sailing from Plymouth, England, in April, 1696, he cruised off the American coast for some months, occasionally entering New York, where by successive recruitments he raised his force to over 150 men, and finally sailed for the East Indies and the E. coast of Africa. Upon his way thither he resolved to turn pirate, and finding his crew not averse to the project, he forthwith commenced a career of plunder and outrage among the shipping which frequented the coasts of Malabar and Madagascar, returning in 1698 with a large store of booty to New York. He took the precaution to bury a portion of his treasure on Gardiner's island at the E. end of Long island, and subsequently repaired to Boston, where he boldly made his appearance in the streets, not doubting that under his commission he could clear himself from any charge of piracy. Such, however, had been the scandal which the report of Kidd's depredations had caused in England, that the earl of Bellamont, governor of Massachusetts and New York, and one of the shareholders in the enterprise, caused him promptly to be arrested and conveyed to England for trial. The charge of piracy was difficult to prove; but having been arraigned for killing one of his crew, named Moore, with a bucket, in an altercation, he was convicted after a grossly unfair trial, and hanged at Execution dock. His name and deeds have been interwoven into popular romance, and form the subject of the well known ballad commencing: "My name is Captain Kidd, as I sailed, as I sailed," many of the incidents of which, however, are apocryphal. The treasures he had left, consisting of 788 ounces of gold, 847 ounces of silver, and several bags of silver ornaments and precious stones, were secured by Bellamont. But according to popular belief this inconsiderable amount constituted but a tithe of all he had collected, and down to the present time the shores of Long Island sound and various parts of the banks of the Hudson river continue occasionally to be explored in the hope of discovering the abandoned wealth of the great pirate.

KIDDER, DANIEL PARISH, D.D., an American clergyman of the Methodist Episcopal church, born in Genesee co., N. Y., in 1815. In 1838 he was appointed teacher of ancient

languages in the Genesee Wesleyan seminary, and in 1836 was graduated at the Wesleyan university, Middletown, Conn. He entered the ministry in 1836 as a pastor in Rochester, N. Y. In 1837 he sailed from Boston as a missionary to Brazil, and resided in Rio de Janeiro till May, 1840. In 1839 he traversed the whole E. coast of the Brazilian empire, from San Paulo on the border of the southern temperate zone to Para on the equator. He introduced and circulated extensively the Scriptures in Portuguese in all the principal cities of the empire, and preached the first Protestant sermon on the waters of the Amazon. It was delivered on the deck of a Brazilian steamship in the harbor of Para, and was followed by a series of similar ministrations in the city itself. He returned to the United States in 1840, and filled several important stations in the New Jersey conference. In 1844 he fixed his residence in New York, having been appointed official editor of the Sunday school publications and tracts, and corresponding secretary of the Sunday school union of the Methodist Episcopal church. He occupied this position 12 years, and, beside editing the "Sunday School Advocate" and travelling extensively in behalf of the Sunday school union, compiled and edited over 800 volumes of Sunday school books. In 1856 he was appointed professor of practical theology in the Garrett biblical institute, Evanston, Ill. He has translated from the Portuguese the work of Feijo, regent of the empire of Brazil, entitled "Demonstration of the Necessity of Abolishing a constrained Clerical Celibacy, exhibiting the Evils of that Institution and the Remedy" (Philadelphia, 1844). He is the author of "Sketches of a Residence and Travels in Brazil" (2 vols. 8vo., Philadelphia, 1845), and, conjointly with the Rev. J. O. Fletcher, of a descriptive and historical work entitled "Brazil and the Brazilians" (8vo., Philadelphia, 1857).

**KIDDERMINSTER**, a municipal and parliamentary borough of Worcestershire, England, situated on the Stour, 18 m. N. from Worcester; pop. in 1851, 18,462. The street are irregularly built, and the houses are generally small. The most important manufacture is of carpets, for which Kidderminster has long been famous. The Stafford and Worcester canal, and the Oxford, Worcester, and Wolverhampton railway, pass through the town. The manor of Kidderminster was once the property of the poet Waller. Here for many years Richard Baxter officiated as pastor. It returns one member to parliament.

**KIDNAPPING**, the stealing and carrying away or secreting of any person. It is regarded by the law as an aggravated species of false imprisonment, and includes the legal elements of that offence. The requisites in an indictment for kidnapping seem to be an averment of an assault, and of the carrying away or transporting the party injured from his own country into another unlawfully and against his will. It has been held, however, in the United States (State *vs.* Rollins, 8 N. H. 550), that transpor-

tation to a foreign country is not necessary to constitute the offence. In the language of the court: "If the party is seized and an actual transportation takes place with a view of carrying him into another country, the offence would seem to be complete." At the common law kidnapping is a misdemeanor, and punishable by fine and imprisonment. The same punishment is adopted by the state statutes in this country.

**KIDNEY**, a special organ in vertebrated animals, whose office is to separate from the blood certain effete substances, to be thrown out of the system in the urine; it has no direct connection with any of the nutritive operations concerned in digestion. Taking these organs in man as typical, the kidneys are situated in the lumbar region, one on each side of the spine, on a level with the last two dorsal and the first two lumbar vertebrae; they are of a brownish red color, bean-shaped, flattened from before backward, and grooved on the interior border for the great vessels; the anterior surface is in relation on the right with the duodenum and the ascending colon, and on the left with the descending colon, the posterior surface is imbedded in fat, resting against the muscles; the upper border is embraced by the supra-renal capsules, which have recently obtained a pathological notoriety in connection with the disease called "bronzed skin." The kidneys are well supplied with blood, in accordance with the importance of their function; the renal arteries come directly from the aorta, and the large veins terminate in the vena cava; the nerves come from the renal plexus. They are covered by a thin, firm, transparent cellular envelope; internally they are composed of two substances, an exterior or cortical and an interior or medullary. From the researches of Bowman, Gerlach, Kölliker, and others, it is ascertained that the cortical substance, the seat of the greater part of the secretory process, is made up of a great number of uriniferous tubes, much convoluted and insculpting with each other, and lined with epithelial cells of a spheroidal and projecting form; scattered through the plexus formed by these tubes and the blood vessels are dark points which have been called *corpora Malpighiana* from their discoverer; these last are convoluted masses of minute blood vessels included in flask-like dilatations of the uriniferous tubes, forming a close relation between the circulating and the secreting systems. The medullary substance is composed principally of tubes passing nearly straight inward to the central receptacle of the secretion. Both these substances are imbedded in interlacing fibres, most abundant in the medullary. In mammals the kidneys are supplied with blood directly from the arterial system, but the renal artery divides very soon after entering the organs into minute twigs which pierce the capsule of the Malpighian tufts; from the convolutions of these tufts arise the efferent vessels which surround the uriniferous tubes, and from which the renal veins are formed; thus the urinary secretion is produced

from blood which has passed through the Malpighian capillaries, the efferent trunks from which have been compared to a portal system within the kidney. The uriniferous tubes end in from 12 to 18 conical bundles, pointing toward the interior, and there embraced by 6 or 12 membranous ducts received into the central reservoir or pelvis of the kidney, from which arises the ureter, the membranous tube which conducts the renal secretion to the bladder. Without entering upon physiological questions which will be more properly treated under URINE, it will be sufficient to state that the kidneys serve to regulate the quantity of water in the system, a large amount of which may be got rid of through their agency. As the skin and lungs, the other channels through which superfluous water is removed from the blood, are liable to be greatly affected by external circumstances, the kidneys perform a very important office in relation to that fluid. Hence the quantity of the renal secretion will depend on the amount of fluid passed off by the skin, being greatest when the cutaneous secretion is least, and *vice versa*; the amount of solid ingredients being dependent on the amount of waste and the excess of nitrogen in the system. The cells lining the tubes probably eliminate the solid matter, while the Malpighian tufts effect the separation of the superfluous fluid through the thin walls of their capillaries; the former illustrates a vital act of secretion, and the latter a mere physical transudation. The kidneys serve to free the blood from highly nitrogenized compounds formed from the decomposition of the albuminous and gelatinous tissues and from some portions of the food; they also remove certain excrementitious compounds, of which carbon is a principal ingredient, abnormally increased when the liver and the lungs do not act freely; by them the superfluous water and various saline matters in excess, and foreign substances introduced into the blood as medicines or otherwise, which would be injurious if retained, are carried off. The kidneys are subject to many painful and dangerous diseases, which can only be alluded to here; among these are vascular congestion, inflammation, fatty degeneration, diseased states produced by retention of urine, by calculi, external violence, and extension from other organs. Bright's disease is one of their most common and fatal affections, the so called granular degeneration, consisting in the distention of the tubules, the surrounding tissue, and even the Malpighian capsules, with exudation matter. Invertebrates have special organs for the secretion of urine, opening into the intestines or into the branchial cavity. In fishes the kidneys are very long, extending the whole length of the spine, even to the head, formed of a mass of simple globules, the ureter opening into the cloaca or a urinary bladder; in reptiles they are generally situated within the pelvis, but in serpents they come further forward and are made up of numerous lobes of a compressed reniform shape. In birds they are elongated,

commencing immediately below the lungs, extending on each side of the spine to the rectum, and variously divided into lobes. In mammals they resemble those of man, except that in cetaceans and some other lower families they are more or less subdivided into lobes, as in the human foetus; in mammals only is there the marked distinction into cortical and tubular substance. The embryological growth of these organs from the Wolffian bodies to the perfect kidneys is a subject of great interest; the former remain in fishes as the permanent kidneys, and are first seen in the course of development in all vertebrates.—For full details on the anatomy and diseased conditions of the kidneys, see the article "Ren" in the "Cyclopædia of Anatomy and Physiology."

KIEL, a seaport of Denmark, capital of the duchy of Holstein, situated on the Kielerfjord, a fine harbor of the Baltic, in lat. 54° 10' N., long. 10° 8' E.; pop. 16,800. It is walled, well built, contains the Glucksborg palace, 4 churches, and a university founded in 1685, with an observatory, a library of 80,000 volumes, a botanic garden, and 800 students. Kiel is important as the only great naval harbor on the S. of the Baltic, and as the terminus of the Holstein canal, which connects the Baltic with the German ocean. It is connected by steamers with all the principal ports of the Baltic. Since the construction of the railroad to Hamburg, Kiel has flourished at the expense of Lübeck. A treaty of peace was concluded at Kiel in 1814 between England, Sweden, and Denmark. The city was blockaded in 1849, and occupied by Austrian troops in 1851-'2.

KIEPERT, HEINRICH, a German geographer, born in Berlin in 1818. He travelled from 1841 to 1843 in Asia Minor. Returning to Europe, he was appointed director of the geographical institute of Weimar, which he left in 1852 to return to his native city, where he has since lived. He has during the past 20 years published a great number of maps remarkable for accuracy and elegance. The greater part of them are descriptive of Greece, Turkey, ancient Italy, and Asia Minor. He also prepared the maps for Robinson's "Biblical Researches in Palestine," and for the 2d part of Ritter's *Erkundung*, and in 1855 one relating to the new explorations in the arctic regions.

KIEV, KIEFF, or KIOW, a government of European Russia, bounded N. by Minsk, E. by Tchernigov and Pultowa, S. by Cherson, S. W. by Podolia, and W. by Volhynia, between lat. 48° and 52° N. and long. 28° and 38° E.; area, about 19,000 sq. m.; pop. in 1856, 1,804,970. The surface of Kiev, which is the most fertile part of the Ukraine or Little Russia, is a plain, here and there undulating, and near the river courses intersected by low ranges. It is watered by the Dnieper, which forms its boundary on the side of Tchernigov and Pultowa, and its western affluents, the Pripetz, Ros, and others, the streams which take their course to the southern Bug or Boh being unimportant. There

is abundance of grain of all kinds, of hemp, flax, honey, wax, and tobacco, excellent timber, and cattle of very good breed, the latter forming a principal article of export. The climate is generally very mild and dry; excessive heat prevails in summer. Agriculture and cattle breeding are the chief occupations of the inhabitants, who consist mainly of Little-Russians. The manufactures are unimportant. Trade is in part carried on by Jews, who are numerous in the adjoining western governments.—KIEV, the capital, is situated on the right bank of the Dnieper; pop. about 50,000, nearly all belonging to the Greek church. It consists of 4 parts, the old town, the Petcherakoi or new fort, both on steep hills, the Podole or low town, between the hills and the river, and the Vladimir town, which was added to the former by the empress Catharine II. The old town, which in the times preceding the conversion of the Russians to Christianity, under Vladimir the Great, was the principal seat of Sarmatian and Russian heathen worship, now contains, beside several other churches, the cathedral of St. Sophia, a magnificent structure of the 11th century, and the palace of the Greek metropolitan. The fort contains the great monastery from which it received its name, and which, together with the bastions and walls of the place, and the glittering gilt and colored cupolas of the churches on the neighboring eminences, makes a strong impression upon the traveller who approaches the city from the other side of the Dnieper. This division embraces the barracks of the garrison, the arsenals and magazines, the houses of the officers, the palace of the governor, numerous churches, and the renowned catacombs of St. Anthony, consisting of excavations in a precipitous cliff on the banks of the river, which attract numberless pilgrims from all parts of Russia through veneration for the saints whose bodies are there preserved. Adjoining are the catacombs of St. Theodosius, which contain a smaller number of saints. The Podole, which is the commercial part of the city, is regularly laid out, and embellished with gardens. Kiev has a large university, founded in 1834, to which are attached a library and cabinets of medals, zoology, mineralogy, and botany. There are also various other institutions of learning, of which the Greek theological academy in the Petcherakoi monastery is the best endowed and most frequented. The manufactures and trade of the city are not important.—The earliest history of Kiev is traced by some to the time of the Greek colonies near the N. coast of the Black sea; others place its foundation in the 5th century A. D. In the last quarter of the 9th century it became the residence of the princes of Novgorod. As the capital of Christianized Russia, it was adorned in the 11th century with a great number of churches. After the middle of the 12th, however, it was deprived of its rank, and subsequently suffered by the devastations of the Tartars, the Lithuanian and Polish wars, the plague, and fires. After having been for about

8 centuries in the hands of the Poles, it was re-annexed to Russia by the peace of 1661.

KILBOURNE, JAMES, an American pioneer, born in New Britain, Conn., Oct. 19, 1770, died in Worthington, O., April 9, 1850. He was successively employed as an apprentice, clerk, merchant, and manufacturer, and at the same time acquired a considerable knowledge of the classics and mathematics. Having early secured a competence, he presented himself as a candidate for orders in the Protestant Episcopal church, and was ordained about 1800 by Bishop Jarvis of Connecticut. He declined several advantageous calls to vacant parishes, and, for the purpose of promoting western emigration, in 1801-'2 organized the Scioto company, under whose auspices a colony of about 100 persons, under the lead of Mr. Kilbourne, was in 1803 established in what is now the township of Worthington in Ohio. Having organized here the Episcopal parish of St. John's, as well as other parishes in the neighborhood, and procured the establishment of a western diocese by the general convention of the Protestant Episcopal church, he retired from the ministry in 1804, and was soon after appointed a civil magistrate, an officer of militia on the N. W. frontier, and surveyor of a large portion of the public lands. In 1812 he was one of the commissioners to settle the boundary between the public lands and the great Virginia reservation, and also commissioned as a colonel in the frontier regiment; and in the succeeding year he entered congress, of which he remained a member until 1817. He was the first to propose donations of lands to actual settlers in the N. W. territory, and as chairman of a select committee he drew up and presented a bill for that purpose. He afterward served for some years in the Ohio legislature. He was also a trustee of Ohio college, at Athens; a commissioner for locating Miami university; and for 35 years president of the board of trustees of Worthington college.

KILDARE, an inland county of Ireland, province of Leinster, bounded N. by Meath, E. by Dublin and Wicklow, S. by Carlow, and W. by Queen's and King's counties; area, 654 sq. m.; pop. in 1851, 95,724. The surface is flat or undulating, and, with the exception of the bogs, has a fertile clayey soil. Farms are less subdivided in this county than in most others. Kildare has a considerable export of grain and flour by means of the river Barrow and the royal and grand canals and their branches. The rivers Liffey and Boyne also traverse a portion of the county, and two railways intersect it. Cotton and woollen fabrics and paper are manufactured to a limited extent. Near the centre of the county is a plain of 4,858 acres, the property of the government, and called the Curragh of Kildare, used for military camps of exercise, and having on it one of the best race courses in the kingdom. The county returns two members to parliament. Principal towns: Naas, the capital, Athy, and Kildare.

**KILDEER**, an American plover, so called from its notes, which resemble the sounds "kil-dee, kildee, dee, dee, dee;" it is the *charadrius vociferus* (Linn.) or the genus *argyalitis* (Boie). The kildeer is about 10 inches long, with an extent of wings of 20, the bill 1 inch, and the weight 6 ounces. The head is small, the neck short, body rather slender, wings reaching to the end of the long tail, feet long and slender, hind tibia bare considerably above the joint, and toe wanting. The bill is black, the edges of the lids bright red, the iris dark brown, and the feet grayish blue; the head above and upper parts of the body light brown with a greenish tinge; rump and upper tail coverts rufous; lower parts white; ring on neck and wide band on breast black; quills brownish black, with about half their inner webs white; white spots on the shorter primaries, and the secondaries edged with the same; the 4 middle tail feathers white tipped, with a wide subterminal black band, and the lateral ones widely tipped with white; the whole upper plumage is sometimes edged with rufous. This bird is common throughout North America, most abundant inland, going to the south in winter, and to the islands of the Atlantic and Pacific. It is very wary, the small flocks when feeding posting a sentinel to warn them of danger; when alarmed it is very noisy, uttering rapidly the notes which have given it its name. It prefers newly ploughed fields, the banks of clear rivers, and elevated worn-out grounds, where it feeds on worms, grasshoppers, beetles, small crustaceans, and snails; toward winter it approaches the sea shore, and at the south is fond of the sugar, cotton, and rice fields, and of marshes, mud flats, and oyster beds. The flight is strong and rapid, whether at high or low elevations, and the speed in running is such as to have become proverbial; the large eyes indicate its habit of feeding by night as well as by day. It breeds in the southern states about the beginning of April, and a month later in the middle states; the nest is either a hollow in the earth or is made of grass on the ground; the eggs, usually 4, are  $1\frac{1}{2}$  by  $1\frac{1}{4}$  inches, cream-colored with irregular purplish brown and black blotches; the parents adopt various devices to divert attention from their nest. The flesh, unless of the young in early autumn, is indifferent, though it is eaten at all seasons of the year.

**KILLAN**, the name of a family of engravers who flourished in Augsburg in the 16th, 17th, and 18th centuries, of whom the following were the most eminent: I. **BARTOLOMÆUS**, born in Augsburg in 1630, died there in 1696. He studied with Matthæus Merrian, and practised his art for a while in Paris, but passed the greater part of his life in Augsburg. He was equally successful in engravings and etchings, and executed a great number of works, consisting principally of portraits. II. **PHILIPP ANDREAS**, a kinsman of the preceding, born in Augsburg in 1714, died in 1759. He became one of the most distinguished artists of his time, and in 1751 commenced the execution of a series

of plates of the chief pictures in the Dresden gallery. Being interrupted in this occupation by the breaking out of the 7 years' war, he executed with the assistance of other artists an extensive series of illustrations of the Bible. He was particularly happy in engraving portraits, two of the best of which are those of the emperor Francis I. and Maria Theresa.

**KILIAN**, **HERMANN FRIEDRICH**, a German physician, born in Leipzig, Feb. 5, 1800. In his childhood he accompanied his father (who from a clergyman became a physician) to St. Petersburg, and commenced the study of medicine at Wilna in 1816. At the age of 20 he received the degree of M.D., and was made assistant professor at the academy of medicine in St. Petersburg. In 1825 he returned to Germany, and in 1831 became professor of obstetrics at the university of Bonn, a position which he has ever since occupied. He is one of the most learned authorities of the day on the subject of obstetrics, and is the author of treatises on the circulation of the blood in infants in the womb, on the surgery of obstetrics, and on the science and art of obstetrics, of an obstetrical atlas, and of the *Armentarium Lucinae Novum* (Bonn, 1856), containing a large number of engravings of obstetrical instruments, both ancient and modern. He has also published treatises on the anatomy of the brain and other subjects.

**KILIMANDJARO**, one of the highest mountains in Africa, situated in the Jagga country, on the border of Zanguebar, about 250 m. from the coast, in lat.  $3^{\circ} 40' S.$ , long.  $36^{\circ} E.$  It is said to be crowned with perpetual snow, with its summit 20,000 feet above the level of the sea. This mountain was discovered in 1850 by the German missionary Dr. Krapf.

**KILKENNY**, an inland county of Ireland, province of Leinster, bounded N. by Queen's county, E. by Carlow and Wexford, S. and S. W. by Waterford, and W. by Tipperary; area, 796 sq. m.; pop. in 1851, 158,746. The surface is generally level, but diversified with some hills, which rise to the altitude of 1,000 feet. The county is intersected by the river Nore, and bounded respectively E. and S. by the rivers Barrow and Suir. The soil is mostly a light fertile loam. Anthracite coal of inferior quality abounds. Fine black marble is quarried near the town of Kilkenny. Various stone piles of the pagan era, cromlechs and cairns, are found in this county, chiefly on the summits of hills. It is divided into 10 baronies, and returns two members to parliament.—**KILKENNY**, a city and parliamentary borough, capital of the preceding county, and a county in itself, is situated on the river Nore, lat.  $52^{\circ} 37' N.$ , long.  $7^{\circ} 13' W.$ , 81 m. by railway S. W. from Dublin, and 27 m. N. by W. from Waterford; pop. in 1851, 20,288. It is well built, paved, lighted, and supplied with water. The principal buildings are the cathedral of St. Canice or Kenny, erected in the 14th century, a Roman Catholic cathedral, several churches, the ruins of a Franciscan monastery, prisons, workhouse, barracks, and a

castle built by Strongbow. Its educational institutions are the Kilkenny college or grammar school, where Swift, Congreve, Farquhar, Bishop Berkeley, and other distinguished persons studied; St. Kyran's Roman Catholic seminary for the education of young men destined for the priesthood; and various other seminaries. Kilkenny sends one member to parliament.

KILLARNEY, a market town and parish of Ireland, co. Kerry, 44 m. N. N. W. from Cork; pop. of the town, which lies partly in the parish of Aghadoe, about 7,000. It is a dirty and unattractive place, containing several hotels, a nunnery, a dispensary, a fever hospital, an alms house, and several churches and chapels, including a handsome Roman Catholic cathedral. It is situated about  $1\frac{1}{2}$  m. E. from a chain of 8 lakes famous for their picturesque beauty, and much resorted to by tourists. The upper or southernmost lake is  $2\frac{1}{4}$  m. long and  $\frac{1}{4}$  m. wide. It contains 12 islets, and is connected by a circuitous stream with the middle, Muckross, or Toro lake,  $1\frac{1}{2}$  m. long. The latter communicates by 8 passages with the lower lake, called also Lough Leane, which is 5 m. long and 8 m. broad, and contains 80 islands. On the peninsula between the middle and lower lakes are the picturesque ruins of Muckross abbey. On the W., S., and S. E. shores rise high mountains, separated by wild ravines, through which flow several beautiful streams. O'Sullivan's cascade, near the W. shore of Lough Leane, consists of 8 distinct falls between high overhanging rocks.

KILLIGREW, SIR WILLIAM, an English poet, born in Hanworth, Middlesex, in 1605, died in London in 1698. He was educated at St. John's college, Cambridge, and afterward travelled on the continent. On his return to England he was appointed governor of Pendennis castle in Cornwall, and afterward gentleman usher to Charles I. When the civil war broke out he was made a captain in the royal horse guards. At the restoration he became gentleman usher to Charles II., and subsequently first vice-chamberlain, which office he held for 22 years. He was buried in Westminster abbey. He wrote "The Siege of Urbin," "Selindra," "Ormaedes, or Love and Friendship," and "Pandora," dramas published at Oxford in 1666, and much praised by Waller. In his old age he wrote two serious works, "Artless Midnight Thoughts," &c., and "Midnight and Daily Thoughts."—THOMAS, an English dramatist, brother of the preceding, born in Hanworth in 1611, died in London in 1682. After visiting France, Spain, and Italy, he became page of honor to Charles I., and at the restoration groom of the bedchamber to Charles II., whose exile and privations he had shared, and over whom, by his coarse licentious wit, he had acquired great influence. He was honored with a grave in Westminster abbey. He was the author of 11 plays, a complete edition of which appeared in 1664.—HENRY, an English divine, brother of the preceding, born in Hanworth in 1612; the period of his death is uncertain. He was edu-

cated at Christchurch, Oxford. When only 17 years old he wrote a tragedy called "The Conspiracy" (reprinted in 1858 under the title of "Pallantus and Eudora"), which won the admiration of Ben Jonson. On being ordained he was appointed chaplain in the army. After the restoration he became almoner and chaplain to the duke of York.—ANNE, daughter of the preceding, born in London in 1660, died in June, 1685, was noted for her virtues, beauty, and accomplishments, but is still better known by the ode which Dryden wrote to her memory. She was "excellent in the sister arts of poesy and painting," and painted a portrait of the duke of York (afterward James II.) and his duchess, to whom she was a maid of honor. A volume of her poems was published in 1686.

KILMARNOCK, a parliamentary and municipal borough of Ayrshire, Scotland, 12 m. N. E. from Ayr,  $88\frac{1}{4}$  m. S. W. from Glasgow, and  $9\frac{1}{4}$  from the seaport of Troon, with all of which it is connected by railway; pop. in 1851, 21,447. The town possesses some handsome public buildings, 18 churches, an academy, several public libraries, a picture gallery, a mechanics' institute, 2 newspapers, &c. It is famed for the manufacture of woollen shawls, carpets, worsted goods, gauzes, muslins, hosiery, and shoes. It returns one member to parliament in conjunction with the boroughs of Port Glasgow, Dumbarton, Renfrew, and Rutherglen.

KILN (Lat. *culina*; Sax. *cylu*, a furnace), an oven employed in manufacturing operations, variously constructed according to the special purpose for which it is designed. The baking of brick is conducted in kilns (see BRICK); and in the treatment of ores preparatory to smelting they are often roasted in kilns, as well as in the open heap. Kilns used in charring wood are described in the article CHARCOAL; and ovens upon the same principle are employed in coking bituminous coal. The ovens used in baking earthenware are also kilns. (See POTTERY.) In the manufacture of lime are employed the most complete forms of kilns, for a description of which see the article upon that subject.

KILOGRAMME. See GRAMME.

KIMBALL, a W. co. of Texas, drained by the head waters of Llano river; area about 1,500 sq. m. It has a rugged surface, with an alternation of narrow valleys and rocky highlands, and abounds in limestone and other building materials. The soil is of good quality, but better adapted to grazing than tillage. The county was organized by the legislature of 1857-'8.

KIMBALL, RICHARD BURLEIGH, an American author, born in New Lebanon, N. H., in 1818. He was graduated at Dartmouth college in 1834, and, after devoting one year to the study of law, went to Europe, travelled in Great Britain and Germany, and resided some time in Paris, where he attended the lectures of the most eminent professors both of medicine and law. Returning to America, he entered upon the practice of law, first at Waterford, N. Y., and then in New York city. His works are: "Re-

miniscences of an Old Man," published in the "Knickerbocker Magazine;" "St. Leger, or the Threads of Life" (New York and London, 1849); "Letters from England;" "Letters from Cuba" (1850); "Cuba and the Cubans" (1850); "Romance of Student Life Abroad" (1858); and "Lecture before the New York Law Institute."

KIMCHI, or KIMCHI, DAVID, a rabbi of Narbonne, celebrated as a Hebrew grammarian, lexicographer, and commentator, flourished in the earlier part of the 13th century. He was the son of Rabbi Joseph Kimchi, surnamed *Mestre Petit*, who about the middle of the 12th century emigrated from Spain during a persecution by the Moslems, and the younger brother and pupil of Rabbi Moses, both distinguished as writers on the same sciences in which David was to eclipse all his predecessors. He was early initiated into the study of philosophy, which at that period had reached its golden age among the Jews of Spain and southern France, especially through the works of Maimonides, of which, in a lively rabbinical controversy, he toward the decline of his life became one of the most eminent defenders. He died in old age. Conscientious research and an uncommonly sound critical judgment are the chief, though not the only merits of Kimchi's writings, which have been regarded down to this day, both by Jewish and Christian scholars, as standard works in their branches. Beside some fragments and minor works, there are extant the "Hebrew Grammar" (Venice, 1545; Leyden, 1681, &c.), and "Hebrew Dictionary" (Naples, 1490; Venice, 1529 and 1552), and commentaries on the prophets, the Psalms, and Chronicles.

KINBURN, a fortress in the Russian government of Taurida, situated on a small peninsula at the mouth of the Dnieper. With the opposite fortress of Otchakoff, it completely commands the entrance of that river. About a mile from the fort stands the pretty village of Kinburn. Most of its inhabitants are fishermen. Within the fort is a monument dedicated to the memory of Gen. Suwaroff, who gained a signal victory over the Turkish invaders there in 1787. On Oct. 17, 1855, after a bombardment of several hours, the fort surrendered to the Anglo-French squadron, and the Russian commander Kochanovitch with his garrison of 1,400 men were taken prisoners. French troops were stationed there during the following winter, notwithstanding the great intensity of the cold. The ships and floating batteries were imbedded in the ice of the Dnieper, and the vessels converted by the French into regular fortifications, the ice being sawn away for some distance, so as to form a deep ditch round each vessel, while the pieces of ice which had been cut away were piled up and used as barricades. No attack however took place. On May 16, 1856, the French evacuated it, and Kinburn was then restored to Russia.

KINCARDINESHIRE, or THE MEARNES, a maritime co. of Scotland, bounded N. by Aberdeenshire, from which it is separated by the

river Dee, E. by the German ocean, and S. and W. by Forfarshire, from which it is divided by the North Esk; area, 381 sq. m.; pop. in 1851, 84,598. Geographically the county is divided into the Grampians or hill district, Deeside, the valley or "howe" of the Mearns, and the coast side. Mount Battock, the highest point of the Grampians in Kincardineshire, is 3,500 feet high. The county is mainly agricultural. There are manufactures of linen. On the coast there are 18 or 14 fishing villages. Capital, Stonehaven.

KINESIPATHY. See LING, PETER HENRIK.

KING (Germ. *König*; Dutch, *konink*; Swed. *konung*, *kung*; Dan. *konge*; Icel. *konunga*, *konge*), a title of dignity designating the supreme ruler of a nation or country. The etymology of the word is far from being settled, some deriving it from the old Gothic *chuni*, family or (noble) race; others from roots like *know*, *can*, *ken*, denoting ability; while others compare it with *khan* and other eastern terms of similar meaning. The Romanic languages all use words little altered from the Latin *rex* (ruler), which was the title of the first 7 sovereigns of Rome, while those who followed the fall of the republic assumed that of *imperator* (commander), now altered into our emperor. The difference between king and emperor, and between kingdom and empire, is not always one of power or extent, but is sometimes the result of historical developments. Thus Louis XIV. and Louis Philippe were satisfied with the title of king, while the sovereign successor to the unaltered dominions of the latter, Napoleon III., assumed that worn by the conqueror from whom he derived his historical claims to power. Soulouque, who like both Napoleons paved his way to the throne by a *coup d'état*, also chose the title of emperor. In Europe there are 15 independent kingdoms, viz: Great Britain and Ireland, Prussia, Sweden and Norway, Spain, the Two Sicilies, Sardinia, Portugal, Bavaria, Denmark, Holland, Belgium, Greece, Hanover, Württemberg, and Saxony. The grand duchies and the electorate (of Hesse) rank next in dignity and power, some of the former surpassing in extent and population the minor kingdoms. Thus Tuscany is superior in territorial extent to Württemberg, and Baden to Saxony. Beside these 15 kingdoms there are others in Europe which, having lost their independence, have maintained their title, adding it to those of the other possessions of their rulers. Thus the emperor of Russia is king of Poland, and the emperor of Austria king of Hungary, Bohemia, &c. There are also some titles preserved by houses who have lost the possessions to which they were attached. The emperor of Austria styles himself king of Jerusalem, and the king of Sweden also king of the Vandals. The royal dignity in Europe is now everywhere hereditary. Formerly there were elective kings of Poland, Hungary, &c.; the former were little more than presidents for life of a republic. The successor elect of the German emperors was called king of

Rome; the same title was bestowed by Napoleon I. on his son. The period of Napoleon was productive of new kingdoms, of which some, as Westphalia and Etruria, were short-lived.

**KING, CHARLES**, an American journalist, president of Columbia college, born in New York in March, 1789. He is the 2d son of Rufus King, and during the residence of his father as American minister at St. James he was sent with his brother John A. King to Harrow school, and in 1805 to a preparatory school in Paris. In 1810 he married Eliza, the eldest daughter of Archibald Gracia, then a leading merchant of New York, with whom he was associated in business. Upon the breaking out of hostilities with Great Britain, Mr. King, though a federalist, deemed it right that the war should be prosecuted to an honorable and successful result; and as a member of the legislature of his native state in 1813, and as a volunteer in the autumn of 1814, he acted upon those sentiments. In 1823 the firm of which he was a member failed, and Mr. King became associated with Johnston Verplanck in the publication of the "New York American," a conservative newspaper, of much political influence and a high literary character, until 1827, when Mr. Verplanck retired and Mr. King continued sole editor. After its publication was discontinued Mr. King was associated in the conduct of the N. Y. "Courier and Enquirer" from 1845 until 1849, when he was chosen president of Columbia college, which office he still occupies. During his presidency the usefulness and the wealth of the college have been greatly increased.

**KING; JOHN CROOKSHANKS**, an American sculptor, born in Kilwinning, Ayrshire, Scotland, Oct. 11, 1806. He was educated as a practical machinist, and emigrating to the United States in 1829 was employed for several years in Cincinnati and Louisville as superintendent of a factory. In 1834, at the suggestion of Hiram Powers, he made a model in clay of the head of his wife, and the success with which the work was accomplished encouraged him to adopt the profession of a sculptor. From 1837 to 1840 he resided in New Orleans, and modelled a number of busts of public men and made cameo likenesses. Subsequently he removed to Boston, where he now lives. He has executed several busts of Daniel Webster, also those of John Quincy Adams, Dr. Samuel Woodward, Professor Agassiz, Ralph Waldo Emerson, and other men prominent in public life or literature.

**KING, JOHN P.**, an American lawyer and financier, born in Barrow co., Ky., about 1800. His father, soon after the birth of this son, removed to Bedford co., Tenn. After receiving an ordinary school education he studied law with Major Freeman Walker of Augusta, Ga., and was admitted to the bar before he was 19 years of age. Major Walker was shortly afterward elected to the United States senate, and Mr. King succeeded to his large practice, which he prosecuted with success for 3 years. He then travelled extensively in Europe, remaining there

several years, and attended lectures in Paris and Edinburgh. After his return from Europe he resumed his profession (in 1825), and at once entered into a highly lucrative practice, but he again abandoned it in 1829. He was elected in 1833 to the senate of the United States by the union democratic party, to fill an unexpired term. He was subsequently reelected for the full term of six years, but in 1837 resigned, avowing his intention to retire to private life. In 1842, when the country was in a state of unusual depression from a recent revulsion, he took charge of the Georgia railroad company, which, like most others of similar character in that day, had failed. Under Mr. King's management it was speedily revived and the road finished, and he has continued president of the company until the present time, the stockholders having refused to allow him to resign. Various other roads extending the connections of the Georgia road, north-west and south-west, have been projected and completed, mainly under his auspices. He received the title of judge by executive appointment, but at the close of the term declined a reelection.

**KING, MITCHELL, LL.D.**, an American judge, born in Scotland, June 8, 1788. In youth he was a severe student and general reader, and began early to write essays. He went to London in 1804, and sailed for Malta in 1805 in a merchantman under convoy of two ships of war, witnessed the fight in which the convoy was destroyed by two French frigates, and was taken as a prisoner to Malaga. After studying the Spanish language he escaped from captivity, and sailed in an American vessel for Charleston, S. C. There he opened a school in 1806, and began to write verses for the newspapers, which attracted considerable attention; and he was soon promoted to a professorship in the college of that city. He began to study law in 1807, continuing his duties as teacher; was one of the founders of the philosophical society in 1809, among the first members of which were Hayne, Gadsden, Grimke, Prioleau, and others, and before which he delivered lectures on astronomy. In 1810 he was admitted to the bar. He soon distinguished himself in various departments of his profession, was prosperous in practice, and in 1815 revisited Europe. In 1819 he became judge, or, as the office was then called, recorder of the city court of Charleston. As early as 1816 he had denounced the principle of a protective tariff as unwise and impolitic, though not illegal, and in 1830-'32 was an active member of the union party, and opposed the doctrine of the state veto, or nullification. As a citizen of large fortune he was prominent in the plans for extending the communications of South Carolina with the West, and was a delegate to numerous conventions held for the purpose. He succeeded Gen. Hayne as president of the Louisville, Cincinnati, and Charleston railroad, a great scheme which ultimately failed. In 1840 he again visited Europe; in 1842 he again became judge of the city court, which office he resigned

in 1844; and at different periods he served as delegate in the state convention, and as president of the trustees of the medical college, and of other societies for the promotion of art, literature, science, and public enterprises. He originated the Charleston literary club, and has written numerous essays and addresses for various societies and literary institutions. The degree of LL.D. has been conferred upon him by the college of Charleston and the university of East Tennessee. He has an extensive reputation for various learning and cultivated tastes, as well as for refined and liberal hospitality. His library of 20,000 volumes is regarded as one of the best private collections in the country.

**KING, PETER**, lord, an English chancellor, born in Exeter in 1669, died in Ockham, Surrey, July 22, 1784. His mother was a sister of the philosopher Locke, at whose suggestion he was sent to the university of Leyden. He afterward entered himself at the Inner Temple, and was called to the bar. In 1699 he commenced his political career, and was elected to parliament for Beer-Alston, Devonshire, which he represented to the end of the reign of Queen Anne. In 1709 he was appointed one of the managers to conduct the impeachment of Sacheverell; and in 1712 acted as counsel, without fee, in defence of Whiston. Soon after the accession of George I. he was made chief justice of the common pleas, and a privy councillor; and in June, 1725, on the removal of the earl of Macclesfield, he was raised to the dignity of lord chancellor, with the title of Baron King of Ockham. He held office till Nov. 26, 1733, when ill health compelled him to resign. He did not figure well on the wool-sack, and more of his decrees are said to have been set aside than of any former chancellor. He was the author of various works in support of the rights of Protestant dissenters, the most important of which perhaps is his "Inquiry into the Constitution, Discipline, Unity, and Worship of the Primitive Church" (London, 1691).

**KING, PHILIP PARKER**, a British admiral, born on Norfolk island, Dec. 18, 1793, died at Grantham, near Sydney, N. S. W., in Feb. 1855. He was the son of a naval officer, who, from the ability he exhibited in the settlement of Norfolk island, was appointed governor of New South Wales in 1800. His son entered the British navy in 1807. In 1817 he was intrusted with the conduct of an expedition to Australia, returning to Europe in 1823, when he published the results of his survey of the inter-tropical and western coasts; the atlas to this work was issued by the hydrographical office at the admiralty. In 1825 he was appointed to survey the S. coast of America, from the entrance of the Rio Plata round to Ohiloë, and of Terra del Fuego, and published in 1832 "Sailing Directions to the Coasts of Eastern and Western Patagonia, including the Straits of Magelhaen and the Sea Coast of Terra del Fuego." Afterward he returned to Australia, where he took an ac-

tive part in public institutions and in political affairs, having been elected in 1851 to the legislature. Shortly before his death he was appointed rear admiral of the blue, being the first instance of a native of Australia rising to so high a rank in the British navy.

**KING, RUFUS**, an American statesman, born in Scarborough, Me., in 1755, died in Jamaica, L. I., April 29, 1827. His father, Richard King, a successful merchant, gave him the best education then attainable. He was prepared for college by Samuel Moody of Newburyport, and was admitted to Harvard college in 1778. During the revolutionary struggle which soon after commenced the college buildings were appropriated for military purposes, and the students were dispersed for a time. In 1776, after the evacuation of Boston by the British troops, the college was reopened in Cambridge, and there in 1777 Rufus King was graduated. He then went to Newburyport to study law under the direction of Theophilus Parsons. But war again broke in upon his studies, and when the expedition against Rhode Island, then occupied by the British, was organized in 1778 under Gen. Sullivan, Mr. King took part in it as a volunteer, and became aide-de-camp to Gen. Glover, who commanded a brigade of Maine men. Owing to the diversion of the French fleet of Count d'Estaing, upon the coöperation of which the success of Gen. Sullivan's expedition depended, the campaign was brief and fruitless. After receiving the thanks of his commander in an order of the day, Mr. King returned to his law studies, which he pursued without further interruption, was admitted to the bar in 1780, and entered on the practice of the law in Newburyport. He was successful from the outset, for he was diligent, methodical, learned, and eloquent. He was moreover sensitively alive to the great conflict in which his country was engaged, and bold and earnest in promoting all measures to strengthen her arms and her cause. In 1782 he was chosen by his townsmen one of their representatives to the general court of Massachusetts. In that body, to which he was repeatedly reelected, he took a leading part, and especially on one of the difficult questions which arose during the revolutionary struggle between the congress of the confederation and the legislature of the states—that of granting a 5 per cent. impost to the congress—he maintained with great ability and eventual success, against the powerful opposition of Gov. Sullivan and others, the indispensableness of granting this aid for the common safety and the efficiency of the confederation. In 1784 he was chosen by the legislature of Massachusetts a delegate to the continental congress, then sitting at Trenton. He took his seat in December, and in March, 1785, moved a resolution: "That there be neither slavery nor involuntary servitude in any of the states described in the resolution of congress of April, 1784, otherwise than in punishment of crime whereof the party shall have been personally guilty; and that this regulation shall be made an article of

compact and remain a fundamental principle of the constitution between the original states and each of the states named in said resolves." This resolution was, by the vote of 7 states (New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, and Maryland), against 4 (Virginia, both Carolinas, and Georgia), referred to a committee of the whole, where for the time it slept. The ordinance offered by Thomas Jefferson in the previous year (April, 1784) proposed the prospective prohibition of slavery in the territories of the United States after the year 1800; Mr. King's proposition was for its immediate, absolute, and irrevocable prohibition. When, two years afterward, the famous ordinance of freedom and government for the N. W. territory was reported by Nathan Dane of Massachusetts (July 11, 1787), Mr. King, who was a member of that congress (then sitting in New York), and a colleague of Mr. Dane, had gone to Philadelphia to take the seat to which he had been elected by Massachusetts as a member of the convention for framing a constitution for the United States. But his colleague embodied in the draft of his ordinance the provision, almost word for word, which Mr. King had laid before congress in March, 1785. While occupied with his duties as member of congress, Mr. King was designated by his state as one of the commissioners to determine the boundary between New York and Massachusetts, and was empowered with his colleague to convey to the United States the large tract of lands beyond the Alleghenies belonging to Massachusetts. On Aug. 14, 1786, Rufus King and James Monroe were appointed a committee on behalf of the congress to wait upon the legislature of Pennsylvania and explain to them the embarrassments of the finances of the United States, and to urge the prompt repeal by that state of the embarrassing condition upon which it had voted its contingent of the 5 per cent. impost levied by the congress on all the states. The speech of Mr. King on this occasion, though no notes of it remain, is commemorated as most effective and brilliant. On May 25, 1787, Mr. King took his seat in the federal convention, which, though called to meet on the 14th of that month, did not form a quorum till the 25th. He had renounced his practice at the bar, and gave himself wholly to the public service. While a member of congress he had married in 1786, in New York, Mary, daughter of John Alsop. The journals of the convention and the fragments of its debates which have come down to us attest the active participation of Mr. King in the important business before them; and the selection of him, one of the youngest members of that body, as one of the committee of five to which it was finally referred to "revise the style of, and arrange the articles" agreed on for the new constitution, affords the best proof of the estimation in which he was held by his colleagues. Having signed the constitution as agreed upon, Mr. King went back

to Massachusetts, and was immediately chosen by his old constituents of Newburyport one of their delegates to the state convention which was to pass upon its acceptance or rejection. Fierce opposition was made in that convention to this instrument, Mr. King leading the array in defence. He was successful, and the ratification was carried by 187 to 168. Mr. King took up his permanent residence in New York in 1788, and in the following year he was elected a representative of that city in the assembly of the state. In the summer of the same year he was chosen by the legislature the first senator from the state of New York under the new constitution, having for his colleague Gen. Schuyler. In this body Mr. King took rank among the leaders of the federal party. The political difficulties of the period were very great; the points, foreign and domestic, to be arranged, complex; and the finances of the country in deplorable confusion. But the public men of the day were equal to its exigencies, and the treaty negotiated by John Jay on behalf of the United States with Great Britain was ratified by the senate and vindicated against the fiercest opposition. In this conflict Mr. King was conspicuous both in the senate and as the joint author with Alexander Hamilton of a series of essays, through the newspapers, under the signature of Camillus. In 1795 he was reelected to the senate, and while serving his second term was nominated by Washington minister plenipotentiary to Great Britain, having previously declined the office of secretary of state, made vacant by the resignation of Edmund Randolph. He embarked with his family at New York in July, 1796, and for 8 years fulfilled most ably and acceptably the duties of the office. No foreign minister probably was more sagacious in ascertaining or divining the views and policy of nations, or more careful in keeping his own government well informed on all the public questions of the day. His diplomatic correspondence may be referred to confidently as a model both in style and in topics. The federal party having lost its ascendancy in the public councils, Mr. King, shortly after Mr. Jefferson's accession, asked to be recalled. He was however urged by the president to remain, as he had in hand important negotiations. The recurrence of war in Europe, consequent upon the rupture of the peace of Amiens, leaving little hope of success on the point to which his efforts had been chiefly directed, that of securing our seamen against impressment, he renewed his request to be relieved; and accordingly a successor was appointed, and Mr. King returned to his country in 1804, and withdrew to a farm at Jamaica, L. I., where he passed his time in study, in the pleasures of a liberal hospitality, keeping up his interest in all public concerns, in correspondence with friends in both hemispheres, and in improving and adorning his grounds. This philosophical retirement was broken in upon by the war of 1812, and he was called in 1813 to take his seat for the third

time as a U. S. senator. Yielding no blind support to the administration, and offering to it no partisan opposition, he yet was ever ready to strengthen its hands against the common enemy. When the capitol at Washington was burned by the British forces, he resisted the proposal to remove the seat of government to the interior, and rallied the nation to defend the country and avenge the outrage. His speech on this occasion in the senate was one of those that marked him as a great orator. At the close of the war he applied himself with like diligence to maturing the policy which should efface as speedily as possible the evils of war and build up permanent prosperity. To a bill, however, for a U. S. bank with a capital of \$50,000,000, he made earnest opposition in the senate. The claim of Great Britain to exclude us from the commerce of the West India islands he in like manner resisted; and to his intelligent exposition of the laws of navigation and of the mercantile interests and rights of the United States we are indebted for the law of 1818. He likewise early discerned the danger of the sales on credit of the public lands, and by his bill substituting cash payments and a fixed but reduced price for these lands, and stipulating a remission of interest and of a portion of the principal of the debt then due therefor, he averted a great political peril, and gave order and security to the receipts from the sale of those lands. In 1819 he was reelected, as in the previous instance by a legislature of adverse politics to his own, to the U. S. senate. Soon after the close of the war, and while at his post in the senate in the winter of 1816, he was, without his knowledge or consent, named as the candidate of the federal party for governor of the state of New York. His wish and purpose were at once to decline this nomination, for the sphere of duty of a senator was that in which he felt himself more fitted to be useful. But his political friends asked it of him as a debt to his party, and he yielded his own preference. He was not elected, and thus was left at liberty to pursue his senatorial career. Shortly afterward the Missouri question, as it has been called, began to agitate the nation. Mr. King was pledged against the extension of slavery; and when therefore Missouri presented herself for admission as a state with a constitution authorizing the holding of slaves, he was inexorably opposed to it. The state of New York, by an almost unanimous vote of its legislature, instructed him to resist the admission of Missouri as a slave state; and the argument made by Mr. King in the senate, though but partially reported, has been the repertory for almost all subsequent arguments against the extension of slavery. He was in like manner opposed to the compromise introduced by Mr. Clay, which partially yielded the principle, and voted to the last against it. His 4th term in the senate expired in March, 1825, when he took leave of that body, and as he hoped of public life, in which for 40 years he had been engaged. One of his latest acts was to present a

resolution, Feb. 16, 1825: "That as soon as the portion of the existing funded debt of the United States for the payment of which the public land of the United States is pledged, shall have been paid off, then and thenceforth the whole of the public land of the United States, with the net proceeds of all future sales thereof, shall constitute and form a fund which is hereby appropriated, and the faith of the United States is pledged that the said fund shall be inviolably applied, to aid the emancipation of such slaves within any of the United States, and to aid the removal of such slaves and the removal of such free persons of color in any of the said states, as by the laws of the states respectively may be allowed to be emancipated or removed to any territory or country without the limits of the United States of America." The resolution was read, and, on motion of Mr. Benton of Missouri, ordered to be printed. John Q. Adams, now become president, urged Mr. King to accept the embassy to England, with which country unadjusted questions of moment were pending, and which the president believed Mr. King, from his familiarity with those questions and his former experience as minister in England, was specially qualified to manage. He reluctantly accepted the mission; but his health gave way, and after a few months spent in England, where he was warmly welcomed, he resigned and came home to die.

KING, SUSAN (PETIGRU), an American authoress, born in Charleston, S. C. The daughter of James L. Petigru, an eminent lawyer of South Carolina, she was highly educated, and was married to Henry C. King, son of Judge Mitchell King. She is the author of several stories of fashionable life, as the "Busy Moments of an Idle Woman," a collection of social sketches; "Lily;" and "Sylvia's World," a series of short tales illustrative of flirtations, slander, coquetry, jilting, and similar fashionable vices. Their animation, clear and easy style, and piquant satire have attracted for them much attention; and these merits, together with local allusions, have given them remarkable popularity in South Carolina. Mrs. King is distinguished in society by her conversational talent, and especially by a frequent epigrammatic felicity of repartee and retort. She has been a contributor to several periodicals.

KING, THOMAS STARR, an American clergyman, born in New York, Dec. 16, 1824. He is the eldest son of the Rev. Thomas Farrington King, who in 1834 was settled as the minister of the first Universalist church in Charlestown, Mass. He was preparing to enter Harvard college when the sudden death of his father left the family in a measure dependent upon his services for a support. From the age of 12 to 20 he was employed either as a clerk or schoolmaster, devoting his leisure hours to theological studies, and in Sept. 1845, preached for the first time in the town of Woburn. In the succeeding year he was settled over his father's former parish in Charlestown, whence he was called in

1848 to the Unitarian church in Hollis st., Boston, with which he remained connected until the early part of 1860. In April of the latter year he sailed for San Francisco, to take charge of the Unitarian congregation in that city. Apart from his labors in the pulpit, Mr. King has acquired an extended reputation as a lecturer, having been regularly employed in that capacity from 1845 to 1860, and having in that time travelled many thousands of miles in all parts of the northern states. He is the author of "The White Hills, their Legends, Landscapes, and Poetry" (4to., illustrated, 1859), and of a number of articles in reviews, pamphlets, and sermons. In 1850 he received the honorary degree of A. M. from Harvard university.

KING, WILLIAM, an Irish bishop, born in Antrim in 1650, died in Dublin, May 8, 1729. He was educated at Trinity college, and ordained in 1674. In 1681 he became dean of St. Patrick's, but having taken a prominent part in the controversies of the time, and in opposition to the policy of the government, he was, after the revolution and the landing of James II. in Ireland in 1689, imprisoned in Dublin castle. On the departure of James he was liberated and restored to his deanery. In 1691 he was promoted to the see of Derry, and in 1702 became archbishop of Dublin. He was the author of many theological and controversial works, the most important of which is his treatise *De Origine Mali* (1702), which provoked attacks from several formidable antagonists, among whom were Leibnitz and Bayle.

KING, WILLIAM, the first governor of the state of Maine, born in Scarborough, Me., in 1768, died in Bath, June 17, 1852. He was during the greater part of his life, the last 50 years of which were passed in Bath, an active and successful merchant, but is better known by his public services in his native state. At an early period of his career he became a member of the Massachusetts legislature, and in that capacity was distinguished by his efforts in behalf of religious freedom, and of securing to original settlers upon wild lands the benefit of their improvements. He was an early and ardent advocate of the separation of Maine from Massachusetts, and upon the consummation of that act presided over the convention which met in 1819 to frame the constitution of the new state. He was subsequently elected the first governor of Maine, and, after holding office a little more than a year, became one of the U. S. commissioners for the adjustment of Spanish claims. He also held other offices of importance under the general and state governments, including that of collector of the port of Bath.

KING, WILLIAM RUFUS, an American statesman, 13th vice-president of the United States, born in Sampson co., N. C., April 6, 1786, died in Dallas co., Ala., April 17, 1853. He entered the university of North Carolina at Chapel Hill at the age of 12, and was graduated in 1803. He then commenced the study of law with William Duffy in Fayetteville, and was admitted

to the bar in 1806. In 1806 he was elected to the legislature from his native county, and was reelected in 1807; but at the meeting of the legislature he was appointed state solicitor for the Wilmington circuit, which office he held for two years, when he resigned. In 1809 he was again elected to the legislature. In 1810 he was elected to congress, and was twice reelected. In congress he united himself with Clay, Calhoun, and others, who advocated the war policy of Mr. Madison's administration, and voted for the declaration of war in June, 1812. In the spring of 1816 he resigned his seat in congress, and accepted the office of secretary of legation to Naples under William Pinckney. Mr. Pinckney was afterward transferred to St. Petersburg, and was accompanied to that court also by Mr. King as secretary. In the autumn of 1818 Mr. King returned home, having visited most of the European countries, and removed to Dallas co., Ala., where he continued to reside until his death. In the spring of 1819 he was elected to the convention which was called to form a constitution and a state government for Alabama, and was elected in 1819 one of the U. S. senators from the new state, drawing the short term of 4 years. He was successively reelected in 1823, 1828, 1834, and 1840. During all this time he acted uniformly with the democratic party. He supported Gen. Jackson for president in 1824, 1828, and 1832. Mr. King was frequently called to the chair of the senate as president *pro tem*. In April, 1844, he was appointed by President Tyler minister to France. The proposition for the annexation of Texas was then pending. England was known to be decidedly opposed to the scheme, and there was a general belief that her government was urging France to join in a protest against it. Mr. King was an active advocate of the annexation, and upon reaching Paris he directed his efforts to prevent this joint protest, in which he was successful. Mr. King returned to the United States in Nov. 1846. In 1848 Senator Arthur P. Bagby was sent as minister to Russia, and Mr. King was appointed by the governor of Alabama to fill the vacancy thus created. In 1849, the term for which he was appointed having expired, he was elected for a full term of 6 years. In 1850, on the accession of Vice-President Fillmore to the presidency after the death of Gen. Taylor, Mr. King was unanimously elected president of the senate. In 1852 he was elected vice-president of the United States, at the time Franklin Pierce was elected president. In Jan. 1853, he went to Cuba for the benefit of his health. By a special act of congress, the oath of office, as vice-president, was administered to him in Cuba by the American consul-general at Havana. In April, 1853, he returned to his home in Dallas co., Ala., where he died.

KING AND QUEEN, an E. co. of Va., bounded S. W. by Mattaponi and York rivers, and E. by the Piankatank; area, 835 sq. m.; pop. in 1850, 10,319, of whom 5,764 were slaves. The surface is moderately uneven. The

soil is not very fertile, but may be improved by the application of marl, of which the county contains large quantities. The productions in 1850 were 376,986 bushels of Indian corn, 68,755 of wheat, 48,883 lbs. of butter, 7,600 of tobacco, and 11,084 of wool. There were 2 saw mills, 18 churches, and 281 pupils attending public schools. Value of real estate in 1856, \$1,787,971, showing an increase of 80 per cent. since 1850. Capital, King and Queen Court House.

**KING AT ARMS.** See **HERALDRY.**

**KING BIRD**, an American flycatcher of the genus *tyrannus* (Cuv.), and species *T. carolinensis* (Baird) or *T. intrepidus* (Vieill.); other names given to it are tyrant flycatcher and field martin. This bird is 8½ inches long, with an extent of wings of 14½; the bill is stout, shorter than the head; the wings long and pointed, the outer primaries abruptly attenuated near the end; tail shorter than the wings, slightly rounded; on the crown a concealed patch of vermilion feathers edged with white and orange, capable of erection as a crest. The color above is dark bluish ash; below white, tinged with bluish ash on the sides of the throat and across the breast; the wings dark brown, the greater coverts and quills edged with white; tail broadly margined and tipped with white. It is found throughout eastern North America to the Rocky mountains, and in Washington territory. According to Audubon, the king bird arrives in Louisiana from the south about the middle of March; it proceeds gradually to the north, going back about the last of August. It prefers orchards, fields of clover, and the vicinity of houses, being seldom found in woods; the flight is rapid, performed by alternate flappings and sailings, much in the manner of our robin. The intrepidity of the king bird is remarkable, as it does not hesitate to attack the crow, vultures, hawks, eagles, and even cats and other animals approaching the nest, plunging upon their backs and striking with the bill; it is the farmer's friend in protecting eggs from the crow and chickens from the hawk, and in devouring noxious insects; and yet from its eating a few bees, raspberries, and figs, it is very generally persecuted. The nest is made in trees, and the eggs, 4 to 6, are reddish white with irregular spots of brown. The notes are tremulous and sharp, and uttered continuously during flight. Many are shot in the southern states, where their flesh is considered a delicacy.

**KING GEORGE**, an E. co. of Va., bounded N. and E. by the Potomac river and S. by the Rappahannock; area, 176 sq. m.; pop. in 1850, 5,971, of whom 3,408 were slaves. The surface and soil are both diversified. The productions in 1850 were 241,900 bushels of Indian corn, 76,707 of wheat, 40,090 lbs. of butter, and 12,806 of wool. There were 11 grist mills, 5 saw mills, 8 churches, and 200 pupils attending public schools. Value of real estate in 1856, \$1,499,585, showing an increase of 87 per cent. since 1850. Capital, King George Court House.

**KING WILLIAM**, an E. co. of Va., bounded N. E. by Mattaponi river and S. W. by the Pamunkey; area, 270 sq. m.; pop. in 1850, 8,779, of whom 5,781 were slaves. It has a rolling surface and a good soil. The productions in 1850 were 253,685 bushels of Indian corn, 108,819 of wheat, 32,580 lbs. of butter, and 10,271 of wool. There were 4 grist mills, 9 churches, and 238 pupils attending academies and other schools. Value of real estate in 1856, \$1,698,502, showing an increase of 24 per cent. since 1850. Capital, King William Court House.

**KINGFISHER**, an extensive family of birds, with a lengthened, generally straight bill, broad at the base with acute tip, rounded wings, short tail, strong and short tarsi. The family includes, according to Gray, the sub-families *buconina* or puff birds, of tropical America; the *galbulina* or jacamars, also South American, already treated; the *halcyonina* or kinghunters, belonging to the old world; and the *alcedinina* or kingfishers, distributed the world over. The sub-family of kingfishers contains the genera *alcedo* (Linn.), *alcyon* (Swains.), and *ceryle* (Boie), with a long, straight, and slender bill, with the culmen sloping to the acute tip. In *alcedo* the wings are short, with the 1st quill nearly as long as the 2d and 8d, which are equal and longest; tail short, broad, and rounded; tarsi very short and robust; toes unequal, the middle one longest, and the inner one short; the claws short and curved. The species of this genus are found in most parts of the old world, where they frequent fresh water rivers and lakes, perching solitary on an overhanging branch, or skimming near the surface in pursuit of their fish prey; they sometimes plunge from a branch, and at others flutter over a spot, suddenly pouncing on a fish as it rises to the surface; they catch the fish with the bill, and swallow it whole head foremost, unless it be too large, in which case they beat it to pieces and swallow the separate fragments. The nest is made at the end of a long gallery which they excavate in the sandy or clayey banks of rivers by their bill and feet, and the eggs are 6 or 7, which are placed on ejected pellets of fish bones. The common kingfisher of Europe (*A. ispida*, Linn.) is about 7 inches long, with a long sharp bill, stout body, and short wings; it possesses many of the brilliant colors of tropical birds, the upper back being dark green, the lower back and rump bright blue; the upper part of the head, wing coverts, and stripe on each side of neck, green with numerous light blue spots; throat and neck stripe yellowish white, and lower parts pale chestnut. The eggs are pinkish white, and are placed in holes in river banks. This bird is the halcyon of the ancients, from whose period and habits of incubation arose the term "halcyon days." (See **HALCYON DAYS**.) Some of the older writers even attributed to the kingfisher the power of arresting the violence of the waves. In some parts of Europe it is still believed that the breast of a kingfisher suspended by the bill

will always be turned to the north, that when accurately balanced the bill will point in the direction of the wind even within doors, and that its head and feathers protect against witches and storms at sea, and are a sure means of securing the affections of a loved object. The flight is direct and rapid, and its note sharp and piercing and emitted on the wing. The genus *alcyon* (Swains.) has no inner toe; its few species are found in Australia and the Indian archipelago; their habits are the same as in the preceding.—The common kingfisher of this country belongs to the genus *ceryle* (Boie); this comprises several species, many of which are found in Africa and India; the tail is long and rounded, the tarsi uncommonly short and stout, and the inner toe much longer than the hinder. The belted kingfisher (*C. alcyon*, Boie) is found throughout North America; the length is about 18 inches, and the extent of wings 22; the head has a long crest; the color is blue above, without metallic lustre; a concealed band across the back of the head, a spot before the eye, and the lower parts white; a band across the breast, and the sides under the wings blue like the back; primaries white on the basal half; tail transversely banded and spotted with white. In the young birds there is a light chestnut band on the breast below the blue one, which last is more or less tinged with chestnut. Specimens from the Pacific coast are considerably the largest. It is a constant resident in the southern states; its flight is rapid, and it often suddenly stops like a sparrow hawk and hovers over the water, dashing headlong after its prey, which it carries to the nearest stump or tree and swallows instantly. It follows the course of rivers even to the cascades of their sources, and its presence near a sequestered stream is good evidence to the angler that trout are there abundant; it is fond of resorting to mill ponds, where the stillness of the water enables it easily to detect its prey. Its notes are very sharp, rapid, and rattling. The nests are made in holes dug to the horizontal depth of from 4 to 6 feet in a bank, the entrance being just large enough to admit a bird, and the end rounded like an oven; the eggs are generally 6, and pure white, and incubation lasts about 16 days, being performed by both parents; the eggs are considered good eating, though the flesh of the bird is fishy and tough. According to Audubon, this bird occasionally plunges into the sea after small fry. The Texas kingfisher (*C. Americana*, Boie) is only 8 inches long, with an extent of wings of a foot; the head is slightly crested; the general color above is glossy or metallic green, and below white; a pectoral and abdominal band of green spots, and a green line on each side of the throat; a collar on the neck, a double row of spots on the quills white; sometimes there is also a chestnut band. It is found in the Rio Grande region and southward.—The sub-family *halcyonina* or kingfishers have the aspect and general habits of kingfishers, from which they differ principally in the broader and stouter bill. The genus *dacelo* (Leach)

is found in Australia and New Guinea; the species are not shy, and one, the *D. gigas* (Bodd) is 18 inches long; they go into the woods, and feed indiscriminately on any animals of suitable size, whether quadruped, bird, reptile, fish, insect, or crustacean; the colors are handsome, and the flight quick and noiseless; their powerful bills render them formidable, and they can successfully resist even the smaller birds of prey; some of the species have a peculiar screaming laugh at sunrise and sunset, which has caused the name of "laughing jackass" to be given to them in Australia. The showy genus *tanyseptera* (Vigors) has a long wedge-shaped tail; it is found in New Guinea and the Philippine islands. The genus *halcyon* (Swains.), with about 50 species, inhabits Africa, Australia, India and its archipelago, and the South sea islands; some of these birds are very handsome, green and blue predominating; like the rest of this sub-family, they build their nest in the hollow trunks of trees. The genus *cerys* (Lacép.), small, 8-toed, short-tailed, and purplish red, is found in India and its archipelago.

KINGLAKE, ALEXANDER WILLIAM, an English barrister and author, born in Taunton in 1802. He was educated at Eton and at Trinity college, Cambridge, and subsequently was entered as a student at law in Lincoln's Inn. He was called to the bar in 1827, and in a few years acquired an extensive chancery practice in London. Not long after his admission to the bar he made an extensive tour in the East, of which he wrote home many graphic descriptions. Upon his return to England he was induced to revise his letters for publication; but having attempted in vain to find a publisher, he threw the manuscript aside, and for some years thought no more upon the subject. Happening one day to be conversing with Mr. Ollivier, a publisher in Pall Mall, on the recent appearance of a book of travels, he offered to give him his manuscript if he would print it. The offer was accepted, and the work, published under the title of "Eöthen," was universally pronounced one of the freshest and most entertaining books of travel of the day. It went through numerous editions in England, was reprinted in the United States, and was translated into the principal languages of Europe. Mr. Kinglake was not allured by this brilliant success from his professional duties, and, with the exception of an article in the "Quarterly Review" on the political uses of the Mediterranean, entitled the "French Lake," and a "History of the Two Years' War in the Crimea, based chiefly on the Private Papers of Lord Raglan and other Authentic Materials," recently announced, he is not known to have made any further contributions to literature. In 1857 he was returned to the house of commons as member for Bridgewater.—JOHN ALEXANDER, cousin of the preceding, and an English lawyer, born in Taunton in 1805. He was educated at Eton and Cambridge, was called to the bar in 1830, made a sergeant at law in 1844, and at the same time appointed

recorder of Exeter, and in 1856 appointed recorder of Bristol. He is a member of parliament for Rochester, and an extreme liberal in politics, being in favor of the vote by ballot, the abolition of church rates, and other popular measures. He has contributed articles to the reviews, and the authorship of "Eöthen" has frequently been erroneously attributed to him.

KINGS, a S. E. co. of N. Y., forming the W. extremity of Long island; area, 72 sq. m.; pop. in 1855, 216,355. It lies between the East river and New York harbor and the Atlantic ocean, embracing several small islands adjacent to the coast. A range of drift hills, from 50 to 300 feet above tide, crosses the county from S. W. to N. E. The soil is a light sandy loam, capable of varied cultivation. Garden vegetables are extensively raised for the New York market, and nearly every other branch of business in the county is also dependent on the metropolis. The productions in 1855 were 54,179 bushels of Indian corn, 18,086 of wheat, 11,679 of oats, 868,243 of potatoes, 28,972 of peas and beans, 31,001 of turnips, 6,183 tons of hay, and 17,425 lbs. of butter; value of market garden produce, \$273,552. There were 5 grist mills, 2 saw mills, 15 furnaces, 4 tanneries, 10 newspaper offices, 49 school houses, and 149 churches. The county was organized in 1683. The Long island railroad runs through it, having its W. terminus at Brooklyn, the capital.

KING'S, a central co. of New Brunswick, drained by the St. John river; area, 1,828 sq. m.; pop. in 1851, 18,842. It is diversified by a succession of hills, some of which, as the Pisgah, Piccadilla, and Moose hill, rise to a considerable height. The whole county, with its large tracts of intervals and meadow, bays, and rivers, presents a varied and somewhat romantic landscape, and is one of the best agricultural counties of the province. The soil is fertile. Iron ore of fine quality is abundant. Coal exists, but has not yet been mined. Limestone and gypsum are plentiful, and there are many mineral springs. Capital, Kingston.

KING'S, a S. W. co. of Nova Scotia, situated on the bay of Fundy and Minas basin; pop. in 1851, 16,895. It has a broken and picturesque coast line, but the borders of the rivers Annapolis, Gaspereaux, Cornwallis, Cunard, Habitant, and Pereau are flat, with large tracts of the richest alluvial deposits. The principal settlements are on those streams and on the post road from Halifax to Annapolis. The Cornwallis river will admit steamers of light draft for upward of 20 miles. The soil is fertile, and the county contains iron ore, copper, silver, and slate. Capital, Kentville.

KING'S, an E. co. of Prince Edward island; pop. in 1848, 15,425. Its coasts are deeply indented by bays and inlets, and lined with settlements. There are also many villages in the interior. Capital, Georgetown.

KING'S, an inland co. of Ireland, province of Leinster, bounded N. by Westmeath, E. by Kildare, S. by Tipperary and Queen's co., and

W. by Roscommon, Galway, and Tipperary; area, 772 sq. m.; pop. in 1851, 112,080. On the S. the county is somewhat broken by ramifications of the Slievebloom mountains, of which the principal summits are Arderin, 1,738 feet high, Carrol hill, 1,584 feet, and Farbreague, 1,411 feet, with two others unnamed, respectively of 1,691 and 1,602 feet. The principal lakes are Loughs Fin, Boara, Annaghmore, and Pallas. The Shannon, Boyne, Barrow, and Brosna are the largest rivers. The soil is of average fertility, and agriculture is devoted to the usual corn crops. There are few minerals and no important manufactures. The county returns two members to parliament. Its chief towns are Birr and Tullamore.

KINGS, Books of, one of the chief divisions of the historical series of the canonical Scriptures. In their contents, if not entirely in style and arrangement, they are a continuation of the books of Samuel, as the latter are of that of Judges. Commencing with the conclusion of the history of David, which forms the chief contents of the books of Samuel, they relate the history of the Hebrew state under Solomon and Rehoboam, of the divided state under the rival dynasties of Israel and Judah, and of the latter alone, after the captivity of the 10 tribes, down to the destruction of Jerusalem by the Babylonians. They thus cover altogether a period of about 430 years, beginning with 1015 B. C. Some chapters dwell with special interest on the acts of the prophets Elijah and Elisha. Excepting these, the work seems to be an extract from the annals of the Hebrew kings, to which reference is frequently made. The name of the author is unknown. Some suppose him to be identical with the author of Samuel, which others regard as improbable on critical grounds. He was probably a contemporary of Jeremiah, if not that prophet himself. The division of the work into two books is not founded on any intrinsic reasons.

KING'S MOUNTAIN, a post village in Gaston co., N. C., in the vicinity of which is an eminence of the same name, situated in York district, S. C., which was the scene of a memorable conflict in the revolutionary war, Oct. 7, 1780. Immediately after the battle of Camden (Aug. 1780), Lord Cornwallis despatched Major Patrick Ferguson, an enterprising partisan officer, with a few hundred regulars and Tories, to scour the western part of South Carolina, with orders to join him at Charlotte, in Mecklenburg co., N. C. Ferguson's force was gradually increased by enlistments to 1,100 men, and the new recruits, mostly tory desperadoes of the worst stamp, committed frightful excesses upon the inhabitants of the country. In the latter part of September, when within a few days' march of Charlotte, he turned aside toward the mountains to disperse a small American force under Col. Clarke; but upon arriving at Gilbert Town, in what is now Rutherford co., N. C., he learned to his surprise that a large body of "mountain men," as the frontiersmen of Georgia and the

Carolinas were called, with many of the neighboring yeomanry and volunteers from Virginia, and even from Kentucky and Tennessee, had hastily assembled to oppose his progress. Breaking up his quarters, he pushed forward to join Cornwallis, sending expresses to inform the latter of his danger, all of whom, however, were intercepted. The patriot forces started immediately in pursuit, and upon arriving at Cowpens, the scene of Morgan's victory over Tarleton a few months later, on the evening of Oct. 6, were informed that Ferguson was at the Cherokee ford on Broad river, about 80 miles distant. They had no general officer, but Col. Campbell of Virginia was intrusted with the temporary command. At a general council of officers it was determined that 900 of the best mounted and equipped men, about half the force, should continue the pursuit, while the remainder should follow as fast as they could. The main body, marching all night, came up with Ferguson at 8 P. M. on the 7th, posted on King's mountain, a narrow stony ridge elevated about 100 feet from the neighboring ravines, and upward of a mile in length. The Americans were formed into 3 bodies, the centre commanded by Cols. Campbell and Shelby, the right by Cols. Sevier and McDowell, and the left by Cols. Cleveland and Williams, which moved simultaneously from different points upon the enemy. Ferguson, who had boasted that "if all the rebels out of hell should attack him, they could not drive him from his position," immediately charged Sevier and McDowell, and pushed them down the hill with the bayonet, the Tories using rifles and fowling pieces armed at the end with large knives. A flank fire from Cleveland and Williams caused him to turn against his new assailants; but the latter had scarcely been repulsed, when he was confronted by the centre under Campbell and Shelby and the rallied troops of Sevier. In this manner the fight continued for upward of an hour, until the enemy, harassed on all sides by the fire of the riflemen, which was rapidly thinning their ranks, were thrown into confusion, and began to retreat along the ridge. Ferguson, shouting to his men: "Crush the damned rebels to the earth," prepared for one final charge, and fell at the head of his regulars pierced by 7 bullets, dying, according to tradition, by the hand of Col. Williams, who was also slain. His men, disheartened by his fall, surrendered to the number of nearly 800, 240 having fallen. Only 200 escaped. The Americans lost only 20 men killed, although a large number were wounded. After the battle 10 of the prisoners notorious for their crimes were hanged, having first been regularly tried and condemned by their captors. This was one of the most brilliant victories of the war, and exercised an important influence in precipitating the downfall of British power in the South. The 75th anniversary of the battle was commemorated by a celebration on the ground, at which an oration was delivered by the Hon. S. T. Preston.

KINGSBOROUGH, EDWARD (King), viscount, an English archaeologist, born Nov. 16, 1795, died in Dublin, Feb. 27, 1837. He is distinguished for his great work entitled "Antiquities of Mexico, comprising Facsimiles of Ancient Mexican Paintings and Hieroglyphics, together with the Monuments of New Spain by M. Dupaix, with their respective Scales of Measurement, and accompanying Descriptions; the whole illustrated by many valuable inedited MSS." (9 vols. fol., London, 1830-'48). The 8th and 9th volumes were published after his death, which took place from a fever caught in a debtors' prison, where he had been temporarily confined for resistance to an attempted imposition. The first 7 volumes are estimated to have cost upward of \$300,000. The work is chiefly valuable for its generally faithful reproduction, in facsimile, of such Mexican hieroglyphical or painted records and rituals as were known to exist in the libraries and private collections of Europe. These, however, are often carelessly arranged, and the pages so confused as to be utterly unintelligible except to advanced students in American archaeology. Most of the original speculations of Lord Kingsborough are exceedingly loose and crude, and mainly directed to the establishment of the hypothesis of the Jewish origin of the American Indians, or at least of the semi-civilized nations of Mexico and Central America. The 9th volume, containing the relation of Don Alva Ixtlixochitl, is imperfect, closing abruptly without finishing the relation. Since the publication of the work of Lord Kingsborough a large number of additional Mexican MSS. or paintings have come to light, including a considerable part of those collected by Boturini, and supposed to have been lost. It has also been found, by careful collation, that the facsimiles of the work are not always critically correct. Still, it must be regarded as by far the most important contribution to American archaeology that has yet been made, and the basis on which the study of Mexican history and antiquities must proceed.

KINGSLEY, CALVIN, D.D., an American clergyman, born in Annsville, Oneida co., N. Y., Sept. 8, 1812. He was graduated at Allegheny college, Penn., in 1841, entered the ministry of the Methodist Episcopal church, and was elected professor of mathematics in Allegheny college. In 1842 he was appointed to Meadville station, still holding his connection with the college. The following year was spent mainly in securing an endowment fund for the institution. In 1844 he was stationed in Erie, Penn., and at the close of his term as pastor returned to the college, and remained for a number of years a member of its faculty. The year 1855 was spent in raising funds for the endowment of the biblical department in the college, and the year following he was elected by the general conference editor of the "Western Christian Advocate." He is the author of a work on the "Resurrection of the Human Body."

KINGSLEY, CHARLES, an English clergyman, novelist, and poet, born in Holne, Devonshire, June 17, 1819. He is the son of the Rev. Dr. Kingsley, rector of St. Luke's, Chelsea, and formerly vicar of Holne, and springs from a family long established in Cheshire. Of his lineal ancestors one was a colonel in the parliamentary service, whose younger brother, emigrating to America, established there a branch of the family, which still flourishes; and another, Gen. Kingsley, commanded a brigade at the battle of Minden. The martial qualities and vigor of character which family tradition ascribes to these ancestors have been frequently manifested by their descendant, though in a different sphere of action. His childhood was passed at Holne vicarage, in a neighborhood abounding in interesting natural features, and in traditional and historical associations, and so fertile and beautiful as to have gained the name of the "garden of England." In his 14th year he was placed under the care of the Rev. Derwent Coleridge, at Ottery St. John, and at the age of 20 was sent to King's college, London, whence in 1840 he removed to Magdalen college, Cambridge. At the university he won distinction with ease, becoming a prizeman in his freshman year, and appearing, when he took his bachelor's degree in 1842, as a first class in classics, and a senior optime in mathematics. After a few months' study of the law he entered the church, and in 1844 was presented to the living of Eversley in Hampshire, of which parish he had previously been curate, and where he has resided down to the present time, combining the faithful and energetic discharge of his duties as a parish priest with literary labors which have gained him a wide-spread reputation. About the time of his presentation he was married to a daughter of Pascoe Grenfell, for many years a liberal member of parliament for Truro and Great Marlow. From the commencement of his labors in the ministry he had been impressed with the necessity of translating Christianity into the every-day life of the people, and making it the most effective means of social amelioration; and his "Twenty-five Village Sermons" (12mo., 1844), addressed to the rustic people who form the bulk of his parishioners, are characterized by great earnestness in the development of this idea, and by a fearless adherence to truth also, which won the sympathies of those for whose benefit they were intended, if they startled and even offended his rich and titled neighbors. His "Saint's Tragedy" (12mo., 1848), a dramatic poem founded on the history of Elizabeth of Hungary, the landgravine of Thuringia, and which contained the author's protest against a species of morbid asceticism which was beginning to affect the English church, attracted attention not less from its literary merits than from its supposed enunciation of the doctrines of what was known as "Christian socialism." The latter impression was not a little strengthened in the public mind by the fact that the work was ushered

into the world by a preface from the Rev. Mr. Maurice, with whom the author had recently allied himself in that theological movement known as the "Broad Church" party, and in whose schemes for ameliorating the physical and moral condition of the working classes he heartily concurred. As early as during his career at the university his sympathies had been excited by what seemed the unnecessary oppressions and privations of the laboring classes, and the revelations subsequently made by Mr. Henry Mayhew in his remarkable series of papers on "London Labor and the Poor" aroused him to immediate action in their behalf. Considering it a duty he owed to his sacred office to inquire into the truth of these revelations, he coöperated with Mr. Maurice and others, under the lead of that gentleman, in arranging a series of interviews with artisans and laborers, the result of which was the establishment among the latter of companies for the purpose of undertaking work in common and sharing the proceeds, the plan of coöperative associations seeming the most effective means of breaking down the system of competitive labor under which the workmen remained in degradation and poverty. The condition of the tailors being particularly deplorable, an experimental organization, called the "Working Tailors' Association," was formed, to which funds were lent through the exertions of the friends of the measure at an interest of 4 per cent. The scheme succeeded, and other associations more or less successful followed, in the establishment of which Maurice and Kingsley participated, insisting, however, that these and all other schemes for social improvement must be based on the truths of the Christian religion to insure their success. Under the influence of these investigations he published in 1850 his first and best known work of fiction, "Alton Locke, Tailor and Poet," a novel having a tailor for its hero, and dealing with the social and political abuses of the day with a vigor and earnestness which gained for the author the title of the "chartist parson," and fully identified him with the theories of the "Christian socialists." In it he aimed to show that while socialism in the French sense of that word was impossible in England, the problem of human misery growing in the midst of human well-being was pressing for a solution, and must be met; that the socialism of England was simply the plea of the suffering individual man to be considered in the arrangement of society; and that this socialism only demanded that every man should have an opportunity to make himself what duty and his conscience should point out to him. In a pamphlet published just before "Alton Locke" appeared, entitled "Cheap Clothes and Nasty," Mr. Kingsley had urged that public hygiene and political economy demanded that no individual man should be condemned from his birth to physical disease and moral despair. The story of "Alton Locke" was an elaboration of this plea clothed in the splendor of romance and weighty with the em-

phases of tragedy. In like manner Mr. Kingsley's doctrines of "muscular Christianity," which have made so positive a mark upon the thought of the time, and which had their literary apotheosis in his romance, "Westward Ho! or the Voyages and Adventures of Sir A. Leigh, Knt." (8 vols. 8vo., 1855), have nothing in common with the creed of the German "rehabilitationists," but simply express his belief that a religious soul can be truly developed only in a healthy body. His prose publications, in addition to those mentioned, include "Yeast, a Problem" (8vo., 1851), "Hypatia, or New Foes with an Old Face" (2 vols. 8vo., 1853), a vivid historical and philosophical romance of the 5th century, both of which originally appeared in "Fraser's Magazine;" "Sermons on National Subjects preached in a Village Church" (2 vols. 12mo., 1852); "Phaëthon, or Loose Thoughts for Loose Thinkers" (8vo., 1852), a philosophical dialogue; "Alexandria and her Schools" (8vo., 1854), the substance of 4 lectures delivered in Edinburgh; "Sermons for the Times" (1855); "Glancus, or the Wonders of the Shore," a charming little treatise on marine zoology and botany, expanded from an article on natural history originally published in the "North British Review;" "The Heroes, or Greek Fairy Tales" (1856); "Two Years Ago" (1856); "Sir Walter Raleigh and his Times;" "Good News of God" (1859); and a variety of miscellaneous sermons and magazine articles. In all these works the author's imaginative power and philosophical grasp of thought are made subservient to a pervading argument in favor of the intellectual and social omnipotence of Christianity. As a lyric poet Mr. Kingsley has attained a high rank by a number of pieces scattered through his prose writings and contributed to various periodicals. A collection of them, including the "Saint's Tragedy," was published in America in 1856 (12mo., Boston), and republished in London in the succeeding year, followed in 1858 by a volume containing "Andromeda," a hexameter poem, and other pieces.—HENRY, brother of the preceding, born in Holne in 1824. He studied at Oriel college, Oxford, and subsequently passed many years in Australia. Returning to England in 1858, he published there a striking novel entitled "The Recollections of Geoffrey Hamlyn," which conveys some very impressive views of life in the southern continent.

KINGSLEY, JAMES LUCE, LL.D., an American scholar, born in Windham, Conn., Aug. 28, 1778, died in New Haven, Aug. 31, 1852. After having been for a short time a student in Williams college, he entered in 1797 the sophomore class in Yale college, where he was graduated in 1799. During the two years following he was occupied in teaching, first in Wethersfield, and afterward in his native town. In 1801 he was appointed a tutor in Yale college, and in 1805 received the newly established professorship of the Hebrew, Greek, and Latin languages in the same institution. He was re-

lieved of a portion of his duties in 1831, when a separate professorship of Greek was instituted, and of another portion in 1835, when a professorship of sacred literature was founded. In Latin he continued to instruct until his resignation in 1851. From 1805 to 1824 Mr. Kingsley was also librarian of the college. By his pupils throughout the country, 8 generations of whom came under his instruction, he is remembered with affection, and many stories are current among them of the exactness of his knowledge and the keenness of his wit. He published a few Latin text books, a historical discourse on the 200th anniversary of the founding of New Haven, a history of Yale college in the "American Quarterly Register," and a life of Ezra Stiles in Sparks's "American Biography."

KINGSTON, a township and the capital of Ulster co., N. Y., on the W. bank of the Hudson river, 90 m. N. from New York and 55 m. S. from Albany; pop. in 1855, 13,974. It is the terminus of the Delaware and Hudson canal, and communicates with Rhinebeck, a station on the Hudson river railroad on the opposite side of the river, by a ferry. Steamboats connect it with New York, Albany, and intermediate places. It has a large business in coal, stone, and ice by canal and river, and contains an extensive lime factory, a cement factory, 18 churches (2 Baptist, 2 Episcopal, 2 Jewish, 1 Lutheran, 5 Methodist, 2 Presbyterian, 3 Reformed Dutch, and 1 Roman Catholic), and a number of schools and academies. Kingston village, on Rondout creek, 2 m. from the Hudson, contains the county buildings, 8 churches, several seminaries, 8 banks, a savings bank, and 4 newspaper offices, and is an active business place; pop. in 1855, 3,971. The principal other villages in the township are Rondout at the mouth of Esopus creek, the seat of most of the river trade, and Eddyville on Rondout creek,  $\frac{1}{2}$  m. above Kingston.—The earliest permanent settlement in the place was made soon after 1665. The first state convention of New York adjourned from Fishkill to Kingston in Feb. 1777. In September following the state legislature met here, but on Oct. 17 a British force under Sir Henry Clinton plundered the village and burned every house but one. The legislature had dispersed on their approach, and the public records were removed to the back settlements. The first constitution of the state of New York was framed at Kingston.

KINGSTON, a city of Frontenac co., Canada West, capital of the united counties of Frontenac, Lennox, and Addington, and formerly capital of the province, situated at the head of the St. Lawrence river, where it issues from Lake Ontario, and at the mouth of Catarqui creek, in lat.  $44^{\circ} 8' N.$ , long.  $78^{\circ} 40' W.$ , 198 m. S. W. from Montreal, and 165 m. E. N. E. from Toronto; pop. in 1852, 11,585; in 1858, 13,000. The harbor is deep and commodious, and is protected by Wolfe and Garden islands, which lie opposite the city at a distance of 3 m. On the W. is the entrance to the bay of Quinté,

and on the E. the terminus of the Rideau canal. Haldimand cove, E. of the city between Point Frederic or Navy Point and Point Henry, is the seat of a royal dockyard. On both these promontories there are fortifications which command the whole harbor. Fort Henry is the principal work of defence; there are also several martello towers near it, and as a military post Kingston is the strongest place in Canada after Quebec. The city is regularly laid out, the streets crossing each other at right angles. Most of the houses are built of blue limestone, which is quarried in the vicinity. Water is supplied partly from the river and partly from wells, some of which are impregnated with mineral substances, and the city is lighted with gas. There are many fine public buildings, among which are the city hall, constructed of hewn stone, and containing, beside the municipal offices, the post office, reading rooms, council room, and a market; the court house, the gaol, and several benevolent and literary institutions. Among the last are Queen's college (Presbyterian), and Regiopolis college (Roman Catholic), each of which receives from government £500 a year; Queen's college school, a mechanics' institute, a house of industry, a general hospital, an asylum for criminal lunatics in connection with the penitentiary, the Hôtel Dieu hospital and orphan asylum, a female academy and free school under the charge of the ladies of the congregation of Our Lady, &c. The provincial penitentiary is situated on the outskirts of the city. There are 18 churches, including a Roman Catholic cathedral. The commercial bank of Canada has its head office here, and 8 other banks have branches. The periodical press comprises 2 daily, 1 tri-weekly, 1 semi-weekly, and 2 weekly newspapers. The principal manufactures are portable steam engines, locomotives, boilers, agricultural implements, iron work, soap and candles, and leather. The Victoria iron works give employment to 75 men, and manufacture 8 tons of bar iron daily. There are also several breweries and distilleries, and various establishments connected with ship building, rigging, &c. Ship building formerly employed a considerable part of the industry of the city, and vessels of the largest class for river, lake, and ocean navigation were constructed here; but of late this branch of business has declined, the railroads interfering with the lake trade. There is a marine railway on which to haul out vessels that are to be repaired. The commerce of Kingston is protected by a board of trade. It is carried on by the lake, the Rideau canal, and the grand trunk railway, which passes within 2 m. of the city, with a branch running into the streets. The imports entered for consumption in 1858 amounted to \$1,754,794 (but this included a considerable amount entered under the reciprocity treaty and reexported), and the exports of domestic produce to \$378,071.—Kingston is one of the oldest settlements in Canada West, having been founded in 1784, and incorporated in 1888. It occupies the site

of Fort Frontenac, built in 1672 by Governor-General Frontenac.

KINGSTON, the principal seaport of the British colony of Jamaica, connected by railway with Spanish Town, situated in the county of Surry, on the S. side of the island; pop. about 32,000, of whom nearly 25,000 are colored. It is built on the N. of a fine landlocked harbor, 6 m. long and 2 m. wide, with a narrow entrance defended by forts, and forming a safe anchorage in which the largest navy might ride. The city is regularly laid out, in the form of a parallelogram, with streets 66 feet wide, built along an inclined plane rising from the sea by gradual ascent to the Liguarea hills, the highest of the Blue mountain range, about 6 m. distant. The space of ground between the hills and the sea is highly cultivated, and studded with residences, among which are the extensive barracks of Up Park, and the Admiral's Pen, or shore residence of the admiral commanding the West India squadron. Most of the houses are of brick, 2 stories high, with verandahs and gardens; but the streets are unpaved. The principal buildings are the Protestant churches, several Roman Catholic chapels and synagogues, a theatre, hospital, penitentiary and poorhouse, market house, Athenæum, free school, society of arts, commercial subscription rooms, &c. Most of the commerce of Jamaica passes through this port. The number of vessels arrived there in 1859 was 402, including 253 British and 87 American. The principal exports are sugar, rum, molasses, ginger, pimento, and coffee. From its situation it enjoys the sea breezes which blow regularly during part of most days in the year, with a land breeze at night. The thermometer ranges from 76° to 96°. The municipal government is vested in a mayor, 12 aldermen, 12 councilmen, and a recorder. It returns 8 members to the colonial house of assembly. Kingston was founded in 1692, immediately after the destruction of Port Royal by an earthquake. Port Royal was rebuilt at the extremity of a long neck of land called "the Palisades," which forms the S. shore of the harbor, and is the naval station.

KINGSTON, ELIZABETH CHUDLEIGH, duchess of, an English peeress, born in 1720, died near Paris, Aug. 28, 1788. Her father, Col. Chudleigh, governor of Chelsea college, died when she was very young, leaving his family in narrow circumstances. As she grew up, her beauty and vivacity attracted much attention; and in her 18th year, by the influence of Mr. Pulteney, afterward earl of Bath, she was appointed a maid of honor to the princess of Wales, the mother of George III. At the princess's court at Leicester house she became one of the reigning toasts of the day, and among her numerous admirers was the duke of Hamilton, whose proposals of marriage she accepted, with the understanding that the nuptials should be celebrated on his return from a visit to the continent. During his absence Capt. Hervey, grandson of the earl of Bristol, became enam-

cred of her, and by the assistance of her aunt, Mrs. Hanmer, who intercepted the letters addressed by the duke to Miss Chudleigh, succeeded in alienating her affections from his rival and in persuading her to be privately married to himself. The day after the marriage, which took place Aug. 5, 1744, she conceived so violent a dislike for her husband that she resolved never to see him again. The duke of Hamilton soon after returned to England, and was naturally astonished that his claim to her hand should be rejected. To escape his reproaches, and those of her mother, who was a stranger to her marriage, at her apparently unreasonable rejection of this and other advantageous offers, she visited the continent, where she pursued a career of scandalous dissipation. During a residence at Berlin Frederic the Great paid her marked attentions, and at Dresden the electress loaded her with presents. Returning to England, she resumed her duties at the court, and became one of the leaders in the fashionable profligacy of the age. The marriage with Capt. Hervey, however, perpetually annoyed her, and in order to destroy all evidences of it she contrived to tear the leaf out of the parish register in which it was recorded. The death of her husband's grandfather, the earl of Bristol, having improved his prospects of succeeding to the earldom, she obtained the restoration of the leaf. Meanwhile the duke of Kingston, ignorant of her marriage, solicited her hand; and having prevailed on her husband to allow a divorce by mutual consent to be pronounced at doctors' commons, she was married a 2d time, March 8, 1769. The duke died 4 years afterward, leaving her in possession of a princely fortune on the condition that she should not again marry. Fortwith she plunged into a course of licentiousness, the censure excited by which constrained her to leave the country for a time. She sailed for Italy in her own yacht, and while living in Rome in great magnificence learned that the family of the duke of Kingston were about to establish against her a charge of bigamy on the ground that her first marriage had been declared void by an incompetent tribunal. Her banker, who was in the interest of her adversaries, refused to advance her money to leave the country, whereupon she proceeded to his residence, pistol in hand, and extorted it from him. Upon arriving in England she found public opinion strongly against her. Foote satirized her in his "Trip to Calais," under the name of "Kitty Crocodile," which however she found means to have prohibited. But, with a vindictiveness which nothing could appease, she caused some outrageous charges to be trumped up against him, the mortification attending which so affected him that he died soon after. On April 15, 1776, the trial of the duchess came on in Westminster hall, which had been fitted up with great state for the purpose, and during the 5 days that it lasted attracted members of the royal family and throngs of distinguished persons. The duchess, attended

by numerous counsel, addressed the peers with great energy, but was declared guilty. Thereupon she pleaded the privilege of the peerage, having now virtually become the countess of Bristol, to which title her first husband had succeeded, and thus escaped the punishment of burning on the hand, with which Dunning had threatened her. She retained her fortune, however, and the utmost efforts of her opponents were powerless to affect the validity of the late duke's will. Thenceforth she became a voluntary exile from England, visiting various European courts, and among others that of Catharine II. of Russia, who received her with great kindness. She ended her days at her chateau in the neighborhood of Paris.

KINGSTON-UPON-THAMES, a municipal borough, town, and parish of Surrey, England, on the E. bank of the Thames, at the mouth of the Ewell, 10 m. W. S. W. from London; pop. of the borough in 1851, 12,144. It extends about 1½ m. along the river, is irregularly built, and contains several interesting edifices, among which are an ancient cruciform church and a handsome new town hall. There are several endowed schools. A Roman town or station was built on the site now occupied by Kingston, and various traces of it, such as coins and other antiquities, have been brought to light. A great ecclesiastical council was held here by Egbert in 838, and many Saxon kings were crowned here.

KINGSTOWN, a seaport and watering place of Ireland, co. of Dublin, on Dublin bay, 7 m. by railway S. E. from Dublin; pop. in 1851, 10,458. It possesses, in the words of the tidal commissioners' official report, "one of the most splendid artificial ports in the United Kingdom." The harbor of refuge, begun in 1816, from designs by Rennie, consists of 2 piers and a breakwater, the E. pier being 8,500 feet long, and the W. 4,950 feet, with an entrance 850 feet wide, and enclosing an area of 250 acres, with a depth of water of from 15 to 27 feet; it cost £750,000. A revolving light marks the entrance in lat. 53° 18' N., long. 6° 8' W. Kingstown is the mail packet station for communication with Dublin and Holyhead. Over 2,000 ships enter and leave the harbor annually.

KINIC ACID, also called cinchonio and quinic acid, is obtained in combination with lime in evaporating the infusion of Peruvian bark to a solid consistence, and treating the extract with alcohol. The salt is insoluble in alcohol, but when dissolved in water crystals are obtained by evaporation. These, being separated and redissolved, may be decomposed by addition of oxalic or sulphuric acid, and after separating the lime salt the kinic acid may be itself crystallized in transparent, colorless, rhomboidal plates. These have a sour taste, and readily dissolve in water or alcohol. Their composition is expressed by the formula  $C_{11}H_{11}O_{11}HO$ . By combining the acid with cinchonia or quinine it is restored to the saline condition in which it existed in the bark, and may thus be applied in medicine in concentrated form more

nearly representing the peculiar character of the bark than in the ordinary combinations of the alkaloid with sulphuric or other mineral acid. Kinic acid by its presence serves to distinguish genuine barks. The method of testing is to boil  $\frac{1}{2}$  oz. of bark with a little lime, and, after pouring off and concentrating the liquor, to commence distilling it in a retort with a mixture of half its weight of sulphuric acid and peroxide of manganese. If kinic acid is present, a volatile substance called kinone or chinone, of yellow color and peculiar odor, the vapor of which is very irritating to the eyes, comes over with the first portions, and is instantly recognized. The spurious barks having no kinic acid do not afford kinone.

**KINKEL, JOHANN GOTTFRIED**, a German poet and patriot, born in Obercassel, Aug. 11, 1815. He was at first devoted to theology and afterward to the study of philosophy, and particularly of the history of art, holding professorships in each branch at the university of Bonn (1837-'48). He has written lyrical poems which have passed through many editions, several books on the fine arts, especially Christian art, and other miscellaneous works. Implicated in the revolutionary movements of 1848 and 1849, during which time he had taken part in the organization of societies for the laboring classes and in military operations against the German governments, he was sentenced to perpetual imprisonment and was confined in the fortress of Spandau. In 1850 he effected his escape with the assistance of some devoted friends, particularly of Karl Schurz, since noted as an orator in Wisconsin. He fled to England, and, after spending some time in the United States, returned to the former country, where he now resides, engaged in teaching, lecturing, and journalistic labors. He married the divorced wife of the publisher Mathieu of Cologne, a Roman Catholic lady, whose maiden name was Johanna Mockel. She shared her husband's political views, and took an active part in some of his literary labors. She was an accomplished musician and writer on music and other subjects. Her health became impaired by over-exertion in laboring for the support of her family, and she lost her life in 1859 by falling or throwing herself out of a window. Parts of a novel left by her were published by her husband in 1859.

**KINNEY**, a S. W. co. of Texas, separated from Mexico by the Rio Grande, and drained by numerous small tributaries of that river; area, 2,400 sq. m. It has a level and well timbered surface. The soil is best suited to grazing. Capital, Brackett. It was formed from Bexar county in 1850.

**KINO**. See GUM.

**KINROSS**, the smallest county in Scotland, bounded E. and S. by Fifeshire and W. and N. by Perthshire; area, 72 sq. m.; pop. in 1851, 8,924. Loch Leven, covering an area of 3,800 acres, and abounding in fish, occupies the centre of the county. The remainder of the surface is level and well cultivated. Its minerals are coal, lime-

stone, and iron. The chief towns are Kinross and Milnathort, with other manufacturing villages employed in the production of plaids, shawls, &c. Kinross-shire and Clackmannanshire together send one member to parliament.

**KIP, WILLIAM INGRAHAM, D.D.**, an American clergyman and author, bishop of the Protestant Episcopal church in California, born in New York, Oct. 8, 1811. He was graduated at Yale college in 1831, and, after devoting some time to the study of the law, entered the general theological seminary of the Episcopal church in New York, and was ordained a deacon in 1835. In 1838 he was called to the rectorship of St. Peter's church in Albany, which position he retained until his consecration in 1853 as missionary bishop of California, where he has since resided, in the active discharge of his episcopal duties. As an author he is well known to a large circle of readers by a variety of popular religious treatises, including "The Lenten Fast," "The Double Witness of the Church," both of which have passed through many editions; "Recantation, or the Confessions of a Convert to Romanism;" "Early Jesuit Missions in North America;" "Early Conflicts of Christianity;" and a series suggested by a visit to Italy in 1844-'5, consisting of "Christmas Holidays in Rome," "Domestic and Religious Life in Italy," and "The Catacombs of Rome," the latter a work of considerable interest founded on personal observations and explorations. He has also been a frequent contributor to periodicals connected with the Episcopal church.

**KIPPIS, ANDREW, D.D.**, an English dissenting clergyman and author, born in Nottingham in 1725, died in London in 1795. He was educated at Northampton, in the theological seminary of Dr. Doddridge, and, after discharging the duties of pastor for some years to the Unitarian congregations of Boston in Lincolnshire and Dorking in Surrey, he removed in 1753 to London, where he became minister of the Unitarian chapel of Prince's street, Westminster. In 1768 he succeeded Dr. Jennings as classical and philological master of Coward's theological academy, and for a brief period acted in the same capacity at the new Unitarian institution at Hackney. His most important works are his edition of the "Biographia Britannica," which he commenced in 1777, and of which he published 5 vols.; and a "Life of Captain James Cook" (2 vols. 8vo., 1788). He also edited the works of Dr. Nathaniel Lardner and Dr. Doddridge.

**KIRBY, WILLIAM**, an English naturalist, born in Witlesham, Suffolk, Sept. 19, 1759, died in Barham, July 4, 1850. He was graduated at Caius college, Cambridge, in 1781, and in the succeeding year took orders, and was appointed to the curacy of Barham. At the end of 14 years, he became the rector of the parish, a position which he filled during the remainder of his life. At the outset of his career he entertained strong opinions against the doctrines of the French revolutionists, and employed his pen in the support of government; but he soon re-

signed political controversy for natural history. Becoming interested in entomology, he joined the Linnean society upon its formation in 1788, and became a frequent contributor to its "Transactions." In 1802 appeared his *Monographia Apium Anglia* (2 vols., Ipswich), the first scientific English work of its class. Several years later he joined his friend Mr. Spence, of Hull, in a project for preparing a popular treatise on entomology, the result of which was the publication in 1815 of the 1st volume of "Kirby and Spence's Introduction to Entomology," of which the 2d volume appeared in 1817, and the 3d and 4th in 1826. The work has gone through many editions, that of 1856 being the latest, and is one of the most pleasing and instructive of its class ever written. Rather more than half of it was contributed by Mr. Kirby. In 1830 he produced a Bridgewater treatise on the "Habits and Instincts of Animals with reference to Natural Theology," and he subsequently wrote the description of insects in Sir John Richardson's *Fauna Boreali-Americana*, beside several minor works. He was a member of the chief scientific bodies of Europe and the United States. His biography was written by the Rev. John Freeman (London, 1853).

KIROHER, ATHANASIUS, a learned German, born in Geisa, Hesse-Cassel, May 2, 1602, died in Rome, Nov. 28, 1680. He was educated at the university of Würzburg, where he afterward taught philosophy and the oriental languages. On the outbreak of the 80 years' war he retired to France, and passed 3 years in the Jesuits' college at Avignon. He then went to Rome, and in 1637 was appointed by the pope to attend Cardinal Frederic of Saxony to Malta. He was afterward for 8 years professor of mathematics in Rome. His most important works are: *Prodromus Copticus sive Aegyptiacus* (Rome, 1636); *Lingua Aegyptiaca Restituta* (1644); and *Latium* (Amsterdam, 1671), with valuable maps and plans. He was a voluminous writer on mathematical and physical science, and his *Mundus Subterraneus* (1662) comprises all the geological knowledge of the day.

KIRGHEEZ, KIRGHIA, or KIRGUIS, STEPPES OF THE, a tract of W. Asia, lying partly in the N. of Toorkistan and partly in the Russian governments of Orenburg and Omsk, between lat. 44° and 55° N., long. 58° and 82° E., bounded N. by Tobolsk and parts of Omsk, E. by Soongaria or the country of the Eleuths, S. by the khanates of Khokan and Khiva, and W. by the Caspian sea and the Ural river; area estimated at 300,000 sq. m.; pop. at 2,260,000. These limits include the steppes of Ishim and Irtysh, through which flow the rivers of the same names. The surface consists chiefly of barren plains, broken here and there by mountain ridges and diversified by salt lakes, some of which are of great size. Lakes Balkash, Issikul, Kurgaljin, Sumy, and Thamy are the largest. Some of the land is arable, and a rude sort of agriculture is carried on near the rivers; millet, rye, and barley are the principal pro-

vol. x.—12

ductions. The Kara-su, the Sihon and its tributaries, the Turgai, Tobui, Tobol, Ishim, and Irtysh are the most considerable rivers. There are several copper mines, which are worked by the Russians. The climate is variable, and hurricanes are frequent and violent.—The Kirgheez are divided into the Little, Great, and Middle hordes, which are politically independent of each other. Most of them are nominally subject to Russia, and the dignity of khan has for some years been disallowed among them as a title of authority. They belong to the Turkish race, but their physiognomy betrays a large admixture of more eastern blood. They resemble the Usbecks, speak the same language, and profess to be related to them. Their stature is under the middle size, their countenance disagreeable, their eyes deep set and elongated, and their cheeks large and bloated; the women are rather pretty and delicately formed. The men, though not muscular, are hardy and vigorous. Their chief occupation is tending sheep, goats, horses, and camels. They have a few domestic manufactures, but on the whole are one of the most barbarous races of Asia, and the efforts of the Russian government to gather them into towns and teach them the arts of civilization have met with no success. A large share of the outdoor as well as domestic labor is left to the women. The dress of the men consists of one or more loose frocks, wide trousers, colored boots, a girdle, and a conical felt hat in summer or a furred cap in winter. That of the women is nearly the same. The more wealthy wear silks, sometimes finely embroidered. Their dwellings, called *yourts*, consist of huts made of willow trellis work covered with a kind of sheeting of wool and camels' hair. Mutton, horse flesh, tea, and sour mares' milk are the principal articles of diet. The Kirgheez are the chief slave catchers of the steppes, and a brother sometimes sells his sisters into servitude in order to avoid the expense of their support. The slaves are sent to Khiva, Bokhara, and other Turkoman states. The religion of the hordes is a corrupt form of Mohammedanism.—See Atkinson's "Oriental and Western Siberia."

KIRK, EDWARD NORRIS, D.D., an American Congregational clergyman, born in New York, Aug. 14, 1802. He was graduated at the college in Princeton, N. J., in 1820, and soon afterward entered a law office in New York, where he continued for 18 months. He then became a member of the theological school at Princeton, and after 4 years of study was appointed agent of the American board of commissioners for foreign missions. In 1828 he was invited to take charge of a pulpit in Albany, N. Y., for a few months. At the expiration of this engagement a new church was organized, and he remained its pastor for 8 years. In 1837 he resigned his charge and sailed for Europe. In Paris and London he was urged to remain as a permanent pastor; but having been appointed secretary of the foreign evangelical

society, he returned in 1889. His new office required him to present to American Protestants the claim of Catholic countries upon their missionary zeal. In the summer of 1842 he accepted a call to become the pastor of a new Congregational church in Boston. The edifice known as the Mount Vernon church was completed early in 1844, and there Dr. Kirk still continues to preach. In 1846 he visited Europe again, and 10 years later he went abroad a third time at the request of the American and foreign Christian union, to inaugurate a regular system of religious worship for American Protestants in Paris. This commission he fulfilled by securing the erection of the American chapel. After a hasty visit to Palestine he returned to his home in Boston. Dr. Kirk has published two or three volumes of sermons, and, aside from his duties as a preacher and pastor, he is engaged in various literary and benevolent enterprises.

KIRKBRIDE, THOMAS S., M.D., an American physician, born near Morrisville, Bucks co., Penn., July 31, 1809. His ancestors were members of the society of Friends (to which he also belongs), and came to America with William Penn. He received the degree of M.D. from the university of Pennsylvania in March, 1832, and was appointed resident physician of the Friends' lunatic asylum at Frankford, Penn. A year later he was elected resident physician of the Pennsylvania hospital, in which he continued two years, when he began general practice in Philadelphia. In Oct. 1840, he was elected superintendent of the Pennsylvania hospital for the insane, a new institution opened in January following. He has published "Rules and Regulations of the Pennsylvania Hospital for the Insane" (1850), which has been a text book and guide in the regulations of new hospitals; and a work "On the Construction, Organization, and General Management of Hospitals for the Insane" (1854). He has also been a frequent contributor to the "American Journal of Medical Sciences," and the "American Journal of Insanity." In 1853 he proposed the erection of a new hospital, and the separation of the sexes in two distinct buildings. To carry out his plan he raised \$350,000 among his friends in Philadelphia and vicinity, and the new hospital, which is devoted to male patients, the old one being occupied by females, is now completed and paid for.

KIRKCALDY, a parliamentary burgh and seaport of Scotland, in the county of Fife, 12 m. N. from Edinburgh, on the N. shore of the frith of Forth; pop. in 1851, 10,475. It extends E. and W. along the shore for nearly 2 m. The most important manufacture is linen, which gives employment to nearly 5,000 spindles and 7 bleach fields, and amounts in annual value to about £200,000. Several free schools have been founded in the towns of this part of Fifeshire through the munificence of Mr. Robert Philp, a merchant of Kirkcaldy, who died in 1829, and left over £70,000 for this purpose. The burgh unites with Burntisland, King-

horn, and Dysart in returning one member to parliament.

KIRKCUDBRIGHT, a S. W. co. of Scotland, bordering on Solway frith, which separates it from the English co. of Cumberland; area, 954 sq. m.; pop. in 1851, 43,121. With the co. of Wigtown, which adjoins it on the W., and part of Ayr and Lanark, it forms the district of Galloway. Most of the surface is hilly, and the N. W. part is mountainous; there are also several high peaks in the S. The principal summits are Blacklurg in the N. (2,890 feet high), Cairnsmoor in the S. W. (2,597), and Criffel in the S. E. (1,831). The principal rivers are the Dee, Fleet, Ken, and Urr. Small lakes are numerous. About  $\frac{1}{4}$  of the soil is capable of cultivation, and when properly manured is very fertile. Cattle of the famous Galloway breed are largely exported. The small Galloway horses were formerly reared here, but have been almost wholly replaced by a larger breed. The county is noted for excellent honey. Kirkcudbright is commonly called a stewartry instead of a shire, and has an officer termed a steward, whose duties correspond to those of a sheriff in other counties. It sends one member to parliament.

KIRKLAND, CAROLINE MATILDA (STANSBURY), an American authoress, born in the city of New York. After the death of her father, who was a bookseller and publisher in New York, the family removed to Geneva, N. Y., where Miss Stansbury was married to Prof. William Kirkland of Hamilton college, who subsequently established a seminary in Goshen, on Seneca lake. A few years later he emigrated with his family to Michigan, whence after a residence of 2 $\frac{1}{2}$  years they removed in 1843 to New York, where Mrs. Kirkland has for the most part since resided. Previous to this she had published "A New Home—Who'll follow?" (Boston, 1839), a record of her own experiences of western life, and the substance of which had originally appeared in private letters; and "Forest Life" (1842). These, as well as her next work, "Western Clearings" (1846), appeared under the assumed name of "Mrs. Mary Olivers." Upon settling in New York she undertook the education of a number of young ladies, whom she received into her house; and in 1847, after the death of her husband, she resumed her literary labors by assuming the editorship of the "Union Magazine," with which she remained connected for 18 months. In 1848 she visited Europe, and on her return published "Holidays Abroad, or Europe from the West" (2 vols. 12mo., 1849). Among her other works are: "The Evening Book, or Fireside Talk on Morals and Manners, with Sketches of Western Life" (1852); "A Book for the Home Circle" (1858); the letterpress to "The Book of Home Beauty," a volume containing portraits of 12 American ladies; and "Personal Memoirs of George Washington" (12mo., illustrated, 1858). She has also published "An Essay on the Life and Writings of Spenser," prefixed to the first book of the "Faery Queen" (1846).

**KIRKLAND, JOHN THORNTON, D.D., LL.D.**, an American clergyman, president of Harvard college, born at Little Falls, N. Y., in 1770, died in Boston, April 26, 1840. He was the son of Samuel Kirkland, a famous missionary among the Indians, was graduated at Harvard college in 1789, and was ordained pastor of the Congregational church in Summer street, Boston, in 1794. There he remained until he was elected president of Harvard college in 1810. He held this office until he was enfeebled by a severe attack of paralysis, when he resigned it, in 1828. He was averse to literary effort, nor was he a man of profound learning; and although a writer of great and acknowledged excellence, he could never be induced to undertake the labor necessary for an extensive work. At various times, however, he published a number of occasional pamphlets, and some biographies. Of these, his life of his intimate friend Fisher Ames (1809) was perhaps the most valuable. He exerted a very great influence during his life, by the force of his intellect and character. He impressed himself strongly upon all with whom he came in contact; and during his presidency the college flourished, both in its internal condition and in its external relations. The characteristic which made him one of the most conspicuous and influential persons of his day in a large circle of society, was the union of extraordinary intellectual force and faculty with the most simple and unassuming manners, and a warm, affectionate, universal, and unfailing kindness. He saved nothing from an abundant income, and gave more than he spent. It was perhaps his fault that, as president of the college, he had no system and few rules. For himself he did not need them; and they might have hampered a sagacity which was abundantly able to meet every exigency as it arose. He left no work which can give an adequate impression of his extraordinary abilities. His fame, which now rests mainly on memory, will soon have no other foundation than tradition.

**KIRSCHWASSER** (Ger. *Kirsche*, cherry, and *Wasser*, water), an alcoholic liquor distilled from the fermented mash of small and sweet black cherries. In the ordinary rude way of preparing it, it is a rank liquor containing hydrocyanic acid derived from the cherry stones. A superior kind is made in the Black Forest from fruit more carefully selected and treated.

**KIRWAN, RICHARD**, an Irish chemist and naturalist, born in the county of Galway about the middle of the 18th century, died in Dublin in 1812. He was educated at Trinity college, and at the Jesuits' college of St. Omer in France. In 1779 he went to England, and settled near London, where he devoted himself to the study of chemistry and geology. Having been admitted a member of the royal society, he read several valuable papers before that body, for which he was awarded the Copley medal in 1781. Returning to Ireland in 1789, he was chosen president of the royal Irish academy, and of the Dublin society and afterward be-

came a member of the principal learned societies of Europe. He was a frequent contributor to the "Transactions" of the various scientific societies of Dublin and London, and wrote several independent works, the most important of which are his "Essay on Phlogiston and the Composition of Acids," in which he labors to reconcile the chemistry of the alchemists with that of modern times; his "Elements of Mineralogy;" and his "Essay on the Analysis of Mineral Waters."

**KISFALUDY, KÁROLY**, a Hungarian dramatist, born in Tété, in the county of Raab, Feb. 6, 1788, died in Pesth, Nov. 21, 1880. At an early age he entered the Austrian army, served in Italy and in the campaign of 1809 in Germany, but quitted the service in the following year in order to marry. He failed, however, in this purpose, and repaired in grief to Vienna, where he turned to profit his proficiency in painting, while zealously devoting himself to the study of modern literature. Having returned to his native country, he suddenly rose in 1819 to immense popularity by a series of national dramas and comedies written in rapid succession for the Hungarian stage in Pesth, and received with patriotic enthusiasm. Among these were: *A tatárok Magyarországon* ("The Tartars in Hungary"), *Zách Klára* ("Clara Zách"), *A kérők* ("The Suitors"), and *A pártütők* ("The Rebels"). These were followed by a number of more elaborate works, including an excellent comedy, *Mátyás dédk* ("The Student Matthias"), and various other contributions, in verse and prose, to the literature of his country. Regarded as the father of the national drama, he was chiefly admired for his humorous delineations of popular Hungarian peculiarities. The *Kisfaludy Társaság*, a useful literary society, was founded to commemorate his name.—SÁNDOR, elder brother of the preceding, born in Sümeg, Sept. 22, 1772, died there, Oct. 28, 1844. He studied at Raab and Presburg, was an enthusiastic spectator at the memorable diet of 1791 held in the latter city, entered the Austrian army in 1793, served in the wars of Italy, and, on the surrender of the citadel of Milan to the French, was sent as prisoner to Vauluse. Here he was inspired by the remembrance of Petrarch and Laura to sing his own love, at that time unhappy, for the beautiful Rosalia Szegedy, in short songs, which he enlarged after his exchange. He was then sent to a regiment in southern Germany, in which he was the only Hungarian. He subsequently served in the campaign of Switzerland, and fought in the battle of Zürich (1799). In 1800 he returned to Hungary, married his Rosalia, and settled on his paternal estate, where he remained till his death, engaged in agricultural pursuits, especially the cultivation of the vine, but for about 25 years also continuing to write poetry. Of his numerous works, which include some historical and other dramas, only the lyrical poems and ballads (*Kegék*) belong to the classical productions of Hungarian poetry. The former, under the title of *Himfy szerelmek* ("The Love

of Himfy"), in 2 parts, *Kesergő szerelme* and *Boldog szerelme* ("Unhappy and Happy Love"), were received on their appearance at the beginning of this century with an unbounded admiration, which in part is attributable to their intrinsic merits, but in part also to the ardor for national literary regeneration, which at that period absorbed the Hungarian public. Some of Kisfaludy's poems have been translated into English by John Bowring. The complete works of both brothers have been edited by Schedel (Toldy).

KISHENEV, a town of European Russia, capital of the government of Bessarabia, situated on the Buik, a tributary of the Dniester, 49 m. N. W. from Odessa; lat. 47° 8' N., long. 28° 50' E.; pop. 48,000. It contains several churches, an ecclesiastical college, gymnasium, and library, and manufactories of wool, leather, and soap.

KISS, AVEUST, a German sculptor, born in Plesse, Prussian Silesia, Oct. 11, 1802. He received his early education in Gleiwitz, and at the age of 20 became a pupil of Rauch at the academy of Berlin. His earliest productions were bas-reliefs for churches and other public buildings, groups of nymphs and tritons for fountains or gardens, and the ordinary classical subjects, executed partly from Rauch's designs and partly from his own. The group of the "Amazon and the Tiger," of which the model was finished in 1839, first brought him into notice, and so great was the admiration which it attracted that a public subscription was raised to have it cast in bronze. A zinc cast, bronzed after the original, which was in the great exhibition of London in 1851, and in that of New York in 1853, has made the work familiar to the public in England and America. His colossal group of "St. George and the Dragon," exhibited in the French exposition of 1855, was subjected to rather severe criticism. Among his other principal works are a statue of Frederic the Great at Breslau, two of Frederic William III., and "St. Michael overthrowing the Dragon." He is a member of the academy of arts in Berlin, and professor of sculpture in the royal academy. One of his most recent works is a colossal tiger's head in bronze, killing a serpent, so placed that the animal appears to be emerging from a cavern on the roadside near Carlsbad.

KISSELEFF, PAVL, a Russian statesman, born in Moscow in 1788. He entered the army in 1806, served in the campaign of 1812-'13, and attracted the attention of the emperor Alexander, whose adjutant he became in 1814, and whom he accompanied to the congress of Vienna. In 1817 he became lieutenant-general, and in 1819 commander of the general staff. After the termination of the Turkish war of 1828-'9, in which he had taken an active though not very conspicuous part, he was intrusted with the command of the Russian garrisons and the civil administration in Moldavia and Wallachia. In 1834 he returned to St. Petersburg with the rank of a general of infantry, and was employed in planning reforms for the better government of the crown lands. A new ministerial office

was created in 1838, devoted exclusively to that branch of administration; Kisseleff was placed at its head, and in 1839 he was made a count. He prevailed upon the emperor to establish an extensive educational system in the crown lands, and the number of schools increased from 40 with 1,500 pupils in 1838, to 2,934, attended by 150,969 boys and 19,496 girls, in 1855. Poor houses, savings and loan banks, industrial and agricultural schools, were gradually established; and the great increase of prosperity which has since taken place is owing in great part to the influence of Kisseleff. He continued to preside over the crown lands until Nov. 1856, when he was appointed ambassador in Paris, a post which he still occupies (1860). He is separated from his wife, a daughter of Count Felix Potocki, who remains enthusiastically devoted to the cause of Poland. — NISOLAI, brother of the preceding, born in 1800, has been in the diplomatic service of Russia for many years, chiefly in Paris, where he represented his government until the outbreak of the Crimean war (1854). Since that time he has officiated as ambassador in Rome.

KISSINGEN, a German watering place in the Bavarian circle of Lower Franconia, pleasantly situated on the Saale, 82 m. N. from Würzburg; pop. 1,600. It is walled, and has very extensive baths with 3 saline springs, much recommended for chronic diseases, gout, and complaints of the stomach. The annual number of visitors is about 4,000, and 400,000 or 500,000 bottles of the water are said to be yearly exported. In the vicinity of Kissingen are salt works, which are supplied by Artesian wells.

KISTNAH, or KRISHNA, a large river of S. India, which rises in the W. Ghats, at Mahabulishwar, and after a S. E. course of about 800 m. discharges its waters by many mouths into the bay of Bengal, near Masulipatam. Its principal tributaries are the Wurna, Malpurba, Gutpurba, Beemah, and Toombuddra. The Kistnah is subject to two periodical risings annually. The first and greatest is caused by the heavy rains of the S. W. monsoon, the other by those of the N. E. monsoon. The banks of this river are in general so high as to prevent the use of its waters for fertilizing purposes; but an attempt is now being made to adapt it for irrigation by means of an embankment thrown across its channel at the head of the delta. The cost of this great work is estimated at £150,000. At Boburlanka, in lat. 16° 5' N., long. 80° 56' E., it divides into two main branches, which diverge from each other in their progress to the sea, and form an extensive delta, intersected by less considerable branches. The Kistnah, on account of the rapid declivity and rocky nature of its water-way, can hardly be anywhere navigated even by small craft; it is usually crossed in large circular baskets, made of bamboo, and covered with hides. It is richer in gems than any other Indian river, diamonds, chalcodones, onyxes, &c., being frequently found in its sediment in the dry season.

KIT-CAT CLUB, a convivial association es-

tablished in London about the time of the revolution. As its leading members were mostly whigs, it quickly assumed a political character, and came to be regarded as the head-quarters of the friends of the Hanoverian succession. It was held in Shire lane, at the house of Christopher (alias Kit) Cat, who supplied its votaries with mutton pies. Addison, Steele, Walpole, Sir Godfrey Kneller, and Marlborough belonged to it. The club was dissolved about 1720. The memoirs of the celebrated members of the Kit-Cat club, illustrated with 48 portraits three quarters in length (whence the term Kit-Cat portraits) from the original paintings by Sir G. Kneller, were published in London in 1891.

KITCHINER, WILLIAM, an English physician and author, born in London about 1775, died there in 1827. He was educated at Eton. His literary works are of a very miscellaneous character. They embrace treatises on gastronomy, health, the eye, telescopes, and music, together with a collection of the "Loyal and National Songs of England." The "Cook's Oracle" is perhaps the most important of his productions.

KITE, an instrument chiefly used by boys as a toy, but also sometimes applied to objects of utility and scientific interest. It is intended to be taken up into the air by the wind to the extent of the string by which it is held, and which serves to draw it back. It consists of a light frame, sometimes of three sticks crossing each other in the centre, their ends connected by a tightly drawn cord, and the whole covered over with paper; or it is made in shape like a strained cross bow, a bow being attached to one end of a lath, and a string passing around the other extremity connecting the two ends of the bow. The kite is suspended by a string fastened to two points on the vertical piece of the frame, and to the loop thus made the end of the long twine is secured, balancing the kite near its centre of gravity. In order to hold it in proper position for the wind to act upon it to the best advantage, which is when it lies at an angle of about  $54\frac{1}{2}^\circ$  with the horizon, a weight is suspended from the lower end in the form of bits of paper tied to a string; this is called the tail. As the face of the kite is presented to the breeze it mounts obliquely upward on the principle of a vessel sailing close to the wind, the string holding the one in place, as the other is prevented from falling to leeward by the resistance of the water. It was by means of the kite that Dr. Franklin in America and Romas in France raised a conductor into the clouds, and by means of the electric spark obtained determined the identity of lightning and electricity.—In the "Transactions of the Society of Arts," vol. xli., is an account of the kite contrived by Capt. Dansey for effecting a communication between a stranded ship and the shore to leeward. This kite is of linen cloth, with the loop by which it is suspended so arranged, that its upper end may be detached by a "messenger," which is a light disk with a hole in the centre slipped upon the lower end of the line. This runs up the

line to the kite, and freeing the upper end of the loop, the kite turns over and pitches straight down head first. A person to leeward may replace the loop and send the kite up again with a messenger presenting little surface to the wind arranged so as to run down the line to the persons holding the lower end. The kite Capt. Dansey used in his experiments was made with  $8\frac{1}{4}$  lbs. weight of linen; the spars, one of which was armed with iron spikes in the head for the purpose of mooring it in the ground as it came down, weighed  $6\frac{1}{2}$  lbs., and the tail, measuring 5 times the length of the kite, was made with 8 lbs. of rope and 14 lbs. of elm plank. It ran out 1,100 yards of line  $\frac{1}{4}$  inch in circumference, and at another time 860 yards of  $1\frac{1}{4}$  inch rope, weighing 60 lbs. Capt. Dansey received a gold medal from the society for his invention.

KITE, the common name of many birds of prey belonging to the sub-family *milvina*, characterized by moderate size, slender figure, short and weak bill with hooked and acute tip and sinuated margins, nostrils basal and lateral, wings long and pointed, tail long, tarsi slender and rather short, toes moderate, broad, and padded. Many of the genera need only be mentioned here; among them, according to Gray, are *basa* (Hodg.), from India, its archipelago, and Australia; *avioidea* (Swains.), from W. Africa; *pernis* (Ouv.) including the old world honey buzzards (see BUZZARD), of which *P. apicivorus* (Selb.) is a well known European representative; *cymindis* (Ouv.) and *gampsonys* (Vigors), from tropical America.—Among the American kites belongs the genus *naucloerus* (Vigors), with long pointed wings and deeply forked tail. The swallow-tailed kite (*N. furcatus*, Linn.) is about 2 feet long, with an extent of wings of  $4\frac{1}{2}$  feet; the back, wings, and tail are black, with a metallic lustre, purple on the wing coverts; head, neck, under wing coverts, base of secondaries, and lower parts white; tarsi and toes greenish blue; bill horn color. This species is found in the southern Atlantic states, and in the interior from Texas to Wisconsin; it is accidental in Europe. The flight of this bird is exceedingly graceful and rapid. Flocks of 15 or 20 are often seen; they arrive in the gulf states early in April, probably from Mexico and Central America, and disappear in September; they are shy, on the wing during most of the day, and at night resting on the highest trees; they feed during flight, and in calm weather soar to an immense height in pursuit of large insects; the gait on the ground is very awkward. The nest resembles that of the crow, and is usually placed in the top of a tall tree; the eggs, 4 to 6, are greenish white, with irregular brown blotches at the larger end.—In the genus *elanus* (Sav.), found in the warmer parts of the globe, belongs the white-tailed or black-shouldered kite (*E. leucurus*, Vieill.); the length is about 16 inches and the extent of wings about  $8\frac{1}{2}$  feet, in the female; the wings are long and pointed, but the tail is moderate and emarginated; the head, tail, and under parts are white; above light

ashy, with an oblong black patch on the shoulders formed by the lesser wing coverts; inferior wing coverts white, with a smaller black patch; the middle tail feathers are light ashy; bill dark; tarsi and toes yellow. It is found in the southern and western states, and in South America; rarely seen north of South Carolina on the Atlantic coast, it occurs considerably further north on the Pacific. It flies very high, and is not easily approached in its favorite marshy retreats; it feeds on small birds and large insects, especially orthoptera, and is very bold in their pursuit. The Mississippi kite (*ictinia mississippiensis*, Wilson), of the southern states, Texas, and New Mexico, a smaller species, has been described under BZZARD. A species of the genus *rostrhamus* (Lesson), generally South American, has been found breeding in Florida; this is the black kite (*E. sociabilis*, Vieill.), remarkable for its slender and much hooked bill; it is about 16 inches long, of a black color, with base of tail and its under coverts white; the young birds are more brownish and yellow; it preys principally on reptiles, and perches on the loftiest trees.—Of the kites of the old world, the best known is the common *milvus regalis* (Briss.) of Europe, of a reddish brown color above, with blackish longitudinal streaks, and the lower parts light brownish red with narrower streaks; the female is about 26 inches long, with an extent of wings of 5½ feet. The flight is remarkably powerful and elegant; the food consists of small quadrupeds, birds, reptiles, insects, carrion, and even fish. It is found in Europe, N. Africa, and W. Asia, in almost all regions, both wild and inhabited; it sometimes steals a young chicken when the hen is off her guard, but dares not make a direct attack in her presence. It is said that in the time of Henry VIII. the streets of London were infested by a great number of kites, which fed upon the offal therein deposited; they became very tame, and their services as scavengers were so highly esteemed that it was forbidden by law to kill them. The black kite (*M. niger*, Briss.), of S. Europe and N. Africa, is a smaller species, and performs the office of scavenger in many of the towns of N. E. Africa; it is very bold, attacking chickens and ducks even in the presence of their owners, seeming to have no fear of man. The Govinda kite (*M. cheela*, Lath.) is very numerous in Calcutta, feeding upon the garbage cast into the streets, in the most crowded thoroughfares, seizing its food on the wing.

KITTANNING, the capital of Armstrong co., Penn.; pop. in 1859, about 2,000. It is situated on a broad alluvial plain on the left bank of the Alleghany river, on the site of an old Indian village of the same name, which was taken and burned Aug. 8, 1757, by Col. (afterward Gen.) Armstrong. The river is crossed by a bridge of 916 feet span. In the hills skirting and opposite the town are found, nearly horizontal, one stratum of canal and 5 of bituminous coal, and 2 each of iron ore and limestone; also pure fire clay and good building stone. The

village has a large rolling mill, 8 founderies, a steam flouring mill, large iron works, 20 blast furnaces, 2 coal oil factories, several salt wells, a bank, town hall, academy, and 6 churches. It is the seat of the university of Kittanning.

KITTIWAKE. See GULL.

KITTO, JOHN, D.D., an English biblical scholar, born in Plymouth, Dec. 4, 1804, died in Cannstadt, Germany, Nov. 25, 1854. He was the son of a mason, and for some time worked at that trade; but having received a fall which disabled him and destroyed his hearing for life, he was compelled to enter the workhouse of Plymouth, whence he was apprenticed to a shoemaker. In consequence of the cruelty of his master his indentures were cancelled, and he went back to the workhouse. It was now discovered that he had made considerable proficiency in study, and a fund was raised to assist him. He soon after published by subscription a small volume of miscellaneous writings. Next he went to Exeter to learn the profession of a dentist; and thence to London, where he was employed in the printing office of the church missionary society. Two years later he went to the society's establishment at Malta, and subsequently he visited Bagdad as a private tutor to the sons of a former friend and patron. There he resided 8 years, and acquired an intimate acquaintance with oriental life. Soon after returning to London, he was introduced to Mr. Charles Knight, the publisher, who engaged him first as assistant in preparing serials for the "Library of Useful Knowledge," and afterward in the compilation of other works. His connection with Mr. Knight continued while his health remained unbroken; but having been seized with paralysis, he retired in 1854 to Cannstadt, where he died. In 1844 he received the degree of D.D. from the university of Giessen; and in consideration of his services to the cause of religion and literature, the British government granted him in 1850 an annuity of £100. His principal works are: an edition of the Scriptures called the "Pictorial Bible" (1835-'8; 2d ed. enlarged, 4 vols. royal 8vo., 1847-'9); "Uncle Oliver's Travels" (2 vols. 12mo., 1838); "Pictorial History of Palestine" (2 vols. royal 8vo., 1839-'40); "Cyclopædia of Biblical Literature" (2 vols. 8vo., 1845-'50); "The Lost Senses: Deafness and Blindness" (12mo., 1845); "Physical Geography of the Holy Land" (2 vols. 18mo., 1848); "Daily Bible Illustrations" (8 vols. small 8vo., 1849-'58). In 1848 he established the "Journal of Sacred Literature," which he edited till 1858. His memoirs have been written by J. E. Ryland (Edinburgh, 1856).

KIWI-KIWI, the New Zealand name of the *aptoryx*, a struthious bird, of the singular family which contains the living cassowary, emu, mooruk, and ostrich, and the extinct *apornis*, *dinornis*, and dodo. The beak resembles that of a long-billed wader, being slender, with the base covered with a bony cere, the upper mandible the longer and containing the openings of the nostrils near the tip; the base of the bill

is furnished with long, slender black bristles intermixed with the feathers, and projecting in all directions; the wings are 2 small crooked appendages, extending about  $1\frac{1}{2}$  inches from the sides of the chest, and terminated by a curved, obtuse, horny claw 8 lines long, having 9 quill plumes differing but little from those of the body; the tail is not apparent; the tarsi are as long as the middle toe, covered with variously sized scales, and very robust as in gallinaceous birds; there are 8 anterior toes, free and covered with scales, and a very short hind toe, all armed with strong and rather sharp claws. The plumage is loose as in other terrestrial birds which have no power of flight, resembling that of the emu in size, structure, and color, but wanting the accessory plumelet; the skin is very tough, a line thick along the back, and there is a large amount of fat between it and the muscles, especially on the back, abdomen, and root of neck; the head is broad and but slightly depressed. The genus *apteryx* was established by Shaw in 1819 from a stuffed skin, and was at that time supposed to have become extinct like the dodo; but in 1838-'8 other specimens arrived, which are described by Mr. Yarrell in vol. i. of the "Transactions of the Zoological Society of London," and by Prof. Owen in vols. ii. and iii. of the same work. Three species are described. *A. australis* (Shaw) is about 80 inches long from tip of bill to end of toes, 19 inches to end of coccyx, and weighs about  $3\frac{1}{2}$  lbs.; the bill varies in length from  $4\frac{1}{2}$  to  $6\frac{1}{2}$  inches, the longest belonging to the females, another anomaly in this bird; the bill is 1 inch wide at the gape and 7 lines high; the color is grayish brown, darkest on the back. *A. Mantelli* (Bartlett), described in 1850, is about 28 inches long, with a bill of 4 inches; the color is dark rufous brown, darkest on the back. *A. Oweni* (Gould), described in 1847, is the largest species, and is said to be about 8 feet high; the upper parts are transversely barred with blackish brown and fulvous, and the plumage is exceedingly dense and hair-like, resembling more the covering of a mammal than a bird; the bill is an inch shorter, more slender, and more curved; the wings are exceedingly rudimentary.—In the "Proceedings of the Zoological Society" for Jan. 1852, Prof. Owen describes an egg of the apteryx, which was  $4\frac{1}{2}$  inches long and  $8\frac{1}{2}$  inches wide, of a long oval form, and of a dirty grayish white color in part due to a decomposed chick within, and the shell  $\frac{1}{2}$  of a line thick; the egg of the *spyrornis*, about 18 inches long, of a capacity of  $10\frac{1}{2}$  quarts, 6 times that of the ostrich or 148 times that of a hen's egg, is, relatively to the size of the bird (which was about twice that of the largest ostrich), smaller than that of the apteryx; the large size of the unhatched young, and the possession within the egg of the remarkable characters of feet, wings, and beak of the adult, show that the young apteryx must be able to provide for itself very soon if not immediately after leaving the egg. The bill of the apteryx is moderately strong, as

the bird is said to be in the habit of resting the head upon it against the ground, and to thrust it into the soil in search of food; it is struthious in structure, and grallatorial only in its length and slenderness. The tongue is short, but larger than in other struthious birds; the oesophagus narrow, the proventriculus and stomach small, and the latter less muscular than in the vegetable-feeding *struthionida*; the intestines are long, and the cæca moderate. There is no trace of extension of air cells, as in birds of flight, into the interspaces of the abdominal viscera, and the diaphragm is well developed and pierced only for the oesophagus and vessels; the lungs are bird-like, and also the organs of circulation, except in the more membranous character of the right auriculo-ventricular valve; the larynx and trachea are struthious. The bones are not perforated for the admission of air, but are tough and compact like those of lizards; the skull is smooth and elevated; the orbits small, and the ethmoid bone very large, corresponding with the feeble vision and acute smell of a bird of nocturnal habits. The spine is strong, especially in the neck, which has 15 vertebrae; the sternum small and without keel, the clavicles absent, and the bones of the wing atrophied; the femur and metatarsus are longer than in others of the family, more as in gallinaceous birds; the ribs are broad, with free bony appendages; the brain cavity is larger than in the diurnal *struthionida*. The thick skin is provided with a distinct and extensive system of cutaneous muscles, to shake off loose earth from the plumage while burrowing for its retreat or nest, taking origin from the bones. The muscles of the back corresponding to the 2d layer in man are more distinct and of greater relative size than in any other bird; the pectorals are feebly developed in accordance with the rudimentary wings; the muscles of the legs are powerful, especially the flexors and extensors, for scratching, running, and burrowing. These birds are found in New Zealand, particularly in regions covered with extensive and thick beds of ferns, in which they hide when alarmed; they are nocturnal in their habits, feeding upon snails, insects, worms, and the large soft-bodied lepidopterous larvae; they run swiftly, and defend themselves vigorously with the feet; the nest is made either at the base of a hollow tree, or in deep holes which they excavate in the ground. The natives pursue them for their skins, which from their strength are highly valued for making dresses.—Though a living specimen has been seen at the zoological gardens in London, the apteryx is probably nearly extinct; the *spyrornis* is supposed to be extinct, though some believe that it may yet exist in the unexplored regions of Madagascar; the dodo has been lost within the memory of man; and the dinornis doubtless antedated the historic period.

KLAGENFURTH, a town of Austria, capital of the duchy of Carinthia, 40 m. N. from Laybach; pop. 14,200. It has manufactories of woollens, silks, and muslins. It is supposed to

occupy nearly the site of the Roman Tiburnia, but it first became a place of interest and importance in the 16th century, when it was fortified by the emperor Maximilian I. Görgey, the Hungarian general, has been confined at Klagenfurt since his surrender in 1849.

KLAMATH, a N. W. co. of Cal., bordering on the Pacific, bounded N. by Klamath river, and traversed by Trinity river; area, about 3,000 sq. m.; pop. in 1858 estimated at 4,480. The surface is mostly mountainous, and in some places is covered with dense forests of redwood, cedar, spruce, and fir. The valleys are fertile, and the hilly districts afford good pasturage. Gold mining is prosecuted to a large extent near Klamath, Trinity, and Salmon rivers, at Gold Bluff, and in the vicinity of the beach. The agricultural products in 1858 were 87,500 bushels of wheat, 40,000 of oats, and 500 of barley. Capital, Orleans Bar. The Klamath Indian reserve, 25,000 acres in extent, is situated partly in this and partly in Del Norte co.

KLAMATH, or TLAMATH, a river of California. It rises in Klamath lake in the S. part of Oregon, and flows S. across the California frontier, just before reaching which it receives the outlet of Rhett or Lower Klamath lake. Its course thence is W. N. W., and afterward S. W., until it is joined by Trinity river on its left bank, when it makes a sharp bend to the N. W., and preserves that direction until it falls into the Pacific about lat. 41° 30' N. There is a bar at its mouth which can be crossed at high water by ships of the line, and at low water by small boats only. Its waters abound in salmon and other fish, and there are valuable gold diggings on its banks. Its length is about 250 m. The town of Klamath is situated on its right bank, a few miles above its mouth.

KLAPKA, GÖRGEY, a Hungarian general, born in Temesvár, April 7, 1820. He studied in Szegedin, Karán-Sebes, and at the school of artillery in Vienna, entered the Hungarian noble life guards of the emperor Ferdinand, and in 1847 was appointed officer in a border regiment. He soon after quitted the service in order to travel. At the outbreak of the revolution in 1848 he offered his services to the new government of his country, and was made captain and sent to the seat of war in the south of Hungary. Recalled in September, he was engaged in some important works of fortification, but soon after returned to the army of the south, where he acted as chief of the staff of Gen. Kiss. At the beginning of 1849 he was enabled to render more essential services to the cause of Hungary, being placed at the head of the army of the north, which under Gen. Mészáros had been defeated by Count Schlik in the neighborhood of Kaschau. He rallied and organized the scattered troops, and took up a position near the Theiss, and not only effectually defended the line of that river, which covered Debreczin, the new seat of the revolutionary government, but also gained decisive advantages over the Austrians in the engagements of Tarczal (Jan. 22),

Kereestur-on-the-Bodrog (23), and Tokaj (31). Görgey simultaneously approaching from the Zips, Klapka pursued his retreating enemy, who evacuated Kaschau, and saved his army by a skilful march. The two enemies met again in the battle of Kápolna (Feb. 26, 27), in which Klapka commanded the right wing of the Hungarian army under Dembinski. When the latter army retreated behind the Theiss, he was conspicuous among the officers who by their declarations obliged the government to dismiss the Polish commander-in-chief; and when Görgey, the principal cause of the change, finally became his successor, Klapka, who had been promoted to the rank of general, received the command of his 1st corps, partaking in the 5 great battles of the April campaign (at Bicske, Izsaaszeg, Waitzen, Nagy-Sarló, and Ács), all of which ended in the defeat of the Austrians. In the following month he had the management of the war department in the newly created ministry; and when Görgey, after the conquest of Buda, resumed the offensive in June, he took command of the fortress of Comorn and of the troops on the right bank of the Danube, and in vain tried to dissuade Görgey from his disastrous plan of operations on the line of the Waag. After several bloody battles both were compelled to retreat; the position at Raab was subsequently lost, and after various engagements around Comorn, Görgey retired toward the Theiss, leaving Klapka with an army of about 18,000 in the fortress. His sortie of Aug. 8, which was one of the most signal deeds of the revolutionary war, almost annihilated the Austrian army of observation before Comorn. He advanced to Raab, and was preparing an invasion of the enemy's territory when the news from the Theiss suddenly destroyed all hope of further advantages. He retired to Comorn, which, after all the other troops in the country had laid down their arms, he surrendered on Oct. 4, on conditions favorable to the garrison, though afterward not strictly observed. Leaving Hungary, he was received in Germany with demonstrations of popular sympathy, and lived for some time in Hamburg, whence he repaired to London, Paris, and afterward to Switzerland. On the outbreak of the war against Russia he went to Constantinople, and after his return became a citizen of Geneva in 1855. In 1859 he was intrusted by the Sardinian government with the organization of a Hungarian legion, and several thousands of volunteers had already been enlisted when the peace of Villafranca suddenly put an end to his new military activity. Klapka is the author of "Memoirs of the War of Independence in Hungary" (Leipzig, 1850; English translation, 2 vols., London, 1850), in which he treats chiefly of the operations around Comorn, and of his relations to Kossuth and Görgey; of a history of "The National War in Hungary and Transylvania" (2 vols., Leipzig, 1851); of "The War in the East," &c. (Geneva, 1855; English ed., London, 1855), and various minor historical writings.

**KLAPROTH, MARTIN HEINRICH**, a German chemist, born in Wernigerode, Dec. 1, 1748, died in Berlin, Jan. 1, 1817. After being engaged for some years in Berlin as a practical chemist, he became an apothecary in 1780, and in 1787 was appointed professor of chemistry in the school of artillery. He was among the first who labored industriously in the classification of minerals by means of scientific analysis. He first found zirconium in a mineral from Ceylon, and his discovery of titanium, uranium, and tellurium will always connect his name with those metals. He first proved that potassium was found in volcanic products and in white garnets, and made known molybdate of lead and sulphate of strontium.—**HEINRICH JULIUS VON**, a German traveller and orientalist, son of the preceding, born in Berlin, Oct. 11, 1783, died in Paris, Aug. 27, 1885. Until the age of 15 he applied himself to chemistry and natural science; but at that time the perusal of books of travel in the East, written by philologists and scholars, determined him to devote himself to oriental languages. After two years spent at the university of Halle, he went in 1802 to Dresden, where he devoted 8 months to the oriental MSS. of its library. Here he began the publication of the *Asiatisches Magazin*. The Russian government having determined in 1805 to send an embassy to Peking, Klaproth, who had already learned the Mantchu, joined the expedition. He did not reach Peking, but remained 6 months at Irkootsk, studying several Asiatic tongues. From this place he explored alone, in 1806, a wide range of the northern Chinese frontier, returning to St. Petersburg in 1807, where he was received with great honor, and again sent on a mission to the then almost unknown mountain regions of the Caucasus. The results of his researches were so little favorable to the hope that Russia could readily acquire dominion over the country, that it was with the greatest difficulty that Klaproth obtained in 1810 permission to publish an account of his expedition. The annoyances which he experienced on this occasion determined him to quit Russia. Two years later (1812) he obtained, but not without great difficulty, leave to depart. In 1814 he visited Italy, and finally came with the allied army to Paris, where he passed the remainder of his life. His principal works are: *Reise in den Kaukasus*, &c. (2 vols., Berlin, 1812-'14); *Supplément au dictionnaire Chinois-Latin du Père Basile de Glemona* (Paris, 1819); *Asia Polyglotta, ou classification des peuples de l'Asie*, &c. (1828-'9); *Tableaux historiques de l'Asie*, &c. (1824-'6); *Mémoires relatifs à l'Asie* (8 vols., 1824-'8); *Tableau historique, &c., du Caucase* (1827); *Vocabulaire Latin, Persan et Coréen* (1828); *Examen critique des travaux de M. Champollion jeune* (1832). He left in MS. an extensive work, *Nouveau Mithridate, ou classification systématique de toutes les langues connues*, which contains a grammatical sketch of most known languages, with a polyglot vocabulary of the

five grand divisions of the world. An English translation by F. Shoberl of his "Travels in the Caucasus and Georgia, performed in 1807-'8," appeared in London in 1814.

**KLAUSENBURG** (Hun. *Kolondár*), the capital of the Austrian province of Transylvania, situated on the Szamos near its source; pop. 25,500, chiefly Magyars. It has a fortified but partly decayed castle, and consists of two towns, the old and new, and 6 suburbs. It has Roman Catholic, Greek Catholic, and Protestant churches, a Roman Catholic gymnasium and seminary, a Unitarian college, a Greek Catholic school, a Franciscan convent, and several benevolent institutions. Toward the close of 1859 a national museum was founded there. Klausenburg contains the only Unitarian college on the continent of Europe, attended in 1860 by about 250 students. It is an important centre of the trade between Transylvania and the neighboring counties of Hungary. It has also manufactories of porcelain. It was a colony of the Romans, and ancient coins and relics are frequently found in the vicinity. Matthias Corvinus was born there, and it has often figured in Hungarian history. During the late Hungarian revolution it was taken by Gen. Bem, Dec. 25, 1848.

**KLAUSTHAL**. See **CLÁUSTHAL**.

**KLÉBER, JEAN BAPTISTE**, a French soldier, born in Strasbourg, March 6, 1753, assassinated in Cairo, Egypt, June 14, 1800. His father, a mason, died when he was a child, and he was educated by a country clergyman, his relative, who sent him to Paris to study architecture under Chalgrin; but at the end of two years he returned to his native city. Two foreign gentlemen, whom he had protected from insult at a café, took him to Germany and placed him in the military school at Munich. The Austrian general Kunnitz, being impressed with his proficiency, appointed him sub-lieutenant in his own regiment, and for several years Kléber served with the imperial troops. He resigned in 1783, and returning to Alsace, succeeded in obtaining the office of inspector of public buildings in the town of Belfort. In 1792 he enlisted as a private in the regiment of Haut-Rhin. He soon became adjutant, distinguished himself during the siege of Mentz, and was raised to the rank of adjutant-general. Notwithstanding this, he was put under arrest on the surrender of that city, and taken to Paris, where he fully vindicated his conduct and that of the whole garrison. He was then made a brigadier-general, sent to La Vendée with the first division of the "army of Mentz," fought heroically against the royalists, defeated them at Chollet, Oct. 17, 1793, and in concert with Marceau gained a victory at Savennay, Dec. 23. The indignation he then manifested at the cruelties ordered by the commissioners of the convention, caused him to be cashiered; but he was recalled to service in 1794, raised to the rank of general of division, and sent to the army of the north under Jourdan. He shared in the victory at Fleurus, June

26, 1794, and in the conquest of the Austrian Netherlands. In 1795 he blockaded Mentz, and directed several bold operations on the banks of the Rhine. In the following campaign he defeated the Austrian division under the prince of Württemberg at the crossing of the Sieg, June 1, 1796, and nearly destroyed the same, 4 days later, at the battle of Altenkirchen. Nevertheless, he was dismissed and retired to Chaillot, in the vicinity of Paris, where he devoted his leisure to preparing his *Mémoires*. In 1798 he joined Bonaparte in his expedition to Egypt, and received a wound on the head at the storming of Alexandria, where he remained in the capacity of governor. He accompanied the expedition to Syria, led the advance division, crossed the desert, took Gaza and Jaffa, won the victory of Mount Tabor, and on the raising of the siege of Acre covered the retreat of the exhausted army. When Bonaparte returned to France, he confided to Kléber the command of the army. The new commander, who never had had any confidence in the possibility of holding Egypt, listened to proposals of peace, and signed the treaty of El Arish with Sir Sidney Smith, by which the French were allowed to leave Egypt with their arms and baggage. Kléber hastened to deliver some of the fortresses he held to the Turks, but was notified by Lord Keith that the treaty had not been ratified by the English government, and that the French army must lay down their arms and give themselves up as prisoners of war. On the reception of this news, Kléber's energies were roused to the utmost; he published the letter of the English admiral in his order of the day, merely adding this sentence: "Soldiers, such a letter can be answered but by victories; be ready for battle!" He marched forward to attack the Turkish army, which was 10 times more numerous than his own, won, March 20, 1800, the brilliant victory of Heliopolis, retook Cairo and several other cities that had risen in insurrection, and found himself again the undisputed master of Egypt. He now succeeded in conciliating Murad Bey, and was about to conclude peace with the Turks, when he was murdered while walking in his garden at Cairo, by a young fanatic named Solymán. Kléber's remains were brought to Marseilles on the evacuation of Egypt by the French army, and placed in the chateau d'If. In 1818 they were removed to his native city, where they were placed under a monument on the principal square, over which a bronze statue was inaugurated, June 14, 1840.

KLEIST, EWALD CHRISTIAN VON, a German poet, born in Zebbin, Pomerania, March 8, 1715, died in Frankfort-on-the-Oder, Aug. 24, 1759. After studying at Königsberg, he entered successively the Danish and the Prussian military service, was appointed lieutenant under Prince Henry by Frederic the Great, and after distinguishing himself for valor was fatally wounded in the battle of Kunersdorf. He devoted his leisure during his campaigns to writing poetry,

chiefly of a descriptive and picturesque character, and while in garrison at Leipzig in 1757 was intimately associated with Gellert and Weisse. His finest poem is *Der Frühling* (1749). An edition of his complete works was published at Berlin in 1808 (2 vols.; 2d ed. 1825). A new edition of his collected works, revised by Julian Schmidt, appeared in Berlin in 1859.

KLEIST, HEINRICH VON, a German poet, born in Frankfort-on-the-Oder, Oct. 10, 1776, died near Potsdam, Nov. 21, 1811. After making the campaign of the Rhine against France, he studied law at Erlangen, travelled in France and Switzerland, and resided in Dresden in 1802, and subsequently in Berlin and in Königsberg. After the battle of Jena he lamented in his poems the misfortunes of his country and his own imprisonment during the French occupation of Berlin. On the declaration of war by Austria against France in 1809, he hastened full of hope toward Vienna, but heard of the conclusion of peace on his way. This and other grievous disappointments induced him two years later to commit suicide at the Heilige See, in company with a friend, the wife of a Berlin merchant. He was one of the most able of the German romantic school of poets, and is placed at their head by Gervinus, who calls him "the political Werther of his age."

KLENZE, LEO VON, a German architect, born in Hildesheim, Hanover, in 1784. He early manifested a strong predilection for architecture, which his father, thinking the unsettled condition of Germany an obstacle to the successful pursuit of this art, endeavored in vain to dissuade him from adopting as a profession. Having spent some time at the polytechnic school in Paris, and in Sicily, where he acquired a taste for Greek architecture, he established himself in Munich after the general peace, and was appointed through the crown prince, afterward King Louis, court architect. In 1816 he was commissioned to prepare the plans for the celebrated Walhalla, near Munich, which, however, was not commenced until 1830, and not inaugurated until 1842. It is modelled on the plan of the Parthenon, and is one of the most imposing structures ever erected after the antique type. Previous to the commencement of this work Klenze designed in 1820 the Glyptothek, or gallery of sculpture, the Pinakothek, or picture gallery, and other public buildings in Munich. He became the friend and adviser of his patron, the crown prince, and upon the elevation of the latter to the throne in 1825 was appointed president of the council. His works, which are found in some of the chief cities of Europe, embrace a great variety of orders or modifications of architectural orders, the Greek being the prevailing one. In the antique he has been most successful. He has published a number of essays and aphorisms on art, including a treatise, illustrated by designs, in which he endeavors to prove that the Grecian style of architecture is alone adapted to ecclesiastical structures.

**KLIOPERA**, WENZESLAW, a Bohemian dramatist, born in Ohlumetz about 1792, died in Prague, Sept. 15, 1859. He was one of the most fertile and gifted dramatists of Bohemia, and has often been called the Oechio Shakespeare.

**KLINGER**, FRIEDRICH MAXIMILIAN VON, a German poet, born in Frankfort-on-the-Main, Feb. 19, 1758, died in St. Petersburg, Feb. 25, 1831. He was educated at Giessen, began to write for the stage at Weimar and Leipsic, was sub-lieutenant in the volunteer corps of Walter in the war of the Bavarian succession, and went from Weimar to St. Petersburg in 1780, where he became colonel under Catharine, major-general and director of the corps of cadets under Paul, and in 1811 lieutenant-general under Alexander. He was in active service nearly 40 years. On German literature he has exercised a powerful influence by the vehemence of his genius. Schlosser the historian places Klinger by the side of Goethe as among the first to follow the suggestion of Lessing by emancipating the German drama from the trammels of the French school, and deriving inspiration from Shakespeare. He was the most conspicuous representative of that excited period of German literature called "storm and pressure period," which in fact took its name from one of his most extravagant dramas, entitled *Sturm und Drang* ("Storm and Pressure," 1775). Of his romances, the most esteemed are *Der Weltmann und der Dichter*, a series of dialogues designed to present the antagonism between the real and the ideal worlds, and *Fuust's Leben, Thaten und Höllenfahrt* (St. Petersburg, 1791). An edition of his select works was published at Stuttgart (12 vols., 1842).

**KLIIPSPRINGER** (Dutch, cliff springer), a S. African field antelope, the *oreotragus saltatrix* (Bodd). The male is about 84 feet long, and 22 inches high at the shoulder; the head is short and broad, with a tapering nose and large bald muffle; the horns, which exist only in the males, are about 5 inches long, slender, vertical, nearly parallel, acute, with a few rings at the base; the tear bag is arched and transverse; the ears are pointed, nearly as high as the horns; the eyes are full, lively, and dark hazel; the hoofs are small, square, and compressed, with large and blunt false hoofs; the tail very short. The body and limbs are robust; the hair is thick, wavy, erect, and quill-like, forming a natural pad to protect the body from bruises and falls in their dangerous retreats; the mammae are two. The color of the hair is grayish, brown at the end, with a short yellow tip, giving the general hue as a brown grizzled with yellow; the lower parts are whitish, and the edge of the ears and feet above the hoofs black; the color varies in intensity according to season. The females resemble the males, except in the absence of horns. These animals live in pairs. They possess the climbing propensities and sure-footedness of the goats, living among rocks inaccessible to man and dogs, and springing like the chamois from one pre-

cipice to another with great agility and rarely failing accuracy. They used to be abundant in the colony of the Cape of Good Hope, but have been so hunted that they are now driven to the mountainous regions of the interior; their venison is considered the best in the country, and their elastic hair is in great demand for stuffing saddles.

**KLOPSTOCK**, FRIEDRICH GOTTLIEB, a German poet, born in Quedlinburg, July 2, 1724, died in Hamburg, March 14, 1803. He was born in a small house at the foot of the castle hill in the *Schlossplatz*, recognizable by the two pillars which support its porch. His father was a public functionary in comfortable circumstances; his mother a woman of great piety and beauty of character. His boyhood was spent amid the invigorating influences of the country, which retained a strong hold upon him during the rest of his life. He was very fond of athletic exercises, especially of skating. He attended the gymnasium of his native town, and in 1740 entered the seminary of Schulpforte. At that early age he was already possessed by the ambition of producing a great epic. The stirring incidents of the life of Henry the Fowler captivated for a time his imagination, as shown by some odes written by him in honor of that prince; but after his attendance at the university of Jena (1745), religious enthusiasm led to the conception of his "Messiah." In 1746 he went to Leipsic, then the resort of many literary men, who, after their secession from the pedantic school of Gottsched, had formed in 1740 a poetical union and established an independent literary journal published in Bremen. Klopstock, in his ode entitled "Wingolf," distinguishes Gellert, Rabener, Hagedorn, Gleim, and many others of his literary associates of Leipsic, who as early as 1747 had recognized him as a poet able to inaugurate a new era in German poetry. The first 8 cantos of his "Messiah" were published in 1748, in the 4th and 5th numbers of the 4th volume of the Bremen "Literary Journal," and the poem was eventually regarded as an epic equal to those of Dante, Milton, and Tasso, especially by the religious and female portion of the community. Gottsched, however, ridiculed what he called Klopstock's "seraphic spirit of fanaticism," and his strictures on his dogmatism, his effeminate and morbid tenderness, and his religious sentimentality were afterward confirmed by Lessing, although in a milder and more dignified spirit. Foremost among his admirers was Bodmer of Zürich, the opponent of Gottsched, the translator of Milton, and the head of a school of poets and religionists. From 1748 to 1750 Klopstock was employed as a teacher in the family of his relative Weiss in Langensalza, where he met the sister of his friend Schmidt, whom he celebrates in his odes as his beloved Fanny, but who did not reciprocate his affection. In the summer of 1750 he went with his friend Sulzer to Zürich, which he left in the following year, in compliance with an invitation from the Danish prime minister

Bernstorff, who offered him a pension of \$300, in order to enable him to devote himself exclusively to the completion of his epic. On his way to Copenhagen he fell in love with Margaretha (Meta) Møller, the daughter of a Hamburg merchant, whom he celebrates under the name of Cidli. On his arrival in the Danish capital he was received with marked distinction, and introduced to the king, whom he accompanied on a journey to Holstein, on which occasion he spent some time with Meta, who became his wife in 1764. She died in 1758, in her 31st year. The loveliness of her character is apparent in her correspondence with Richardson, the English novelist, with Oramer, an intimate friend of Klopstock, and with her husband. (See "Memoirs of Frederic and Margaret Klopstock," English translation, by Elizabeth Smith, London, 1808; and her correspondence with Richardson, 1818). Klopstock resided now alternately in Brunswick, Quedlinburg, and Blankenburg, until 1768, when he returned to Copenhagen. In 1771, on his friend Bernstorff's withdrawal from the ministry, he went to Hamburg with the rank of a councillor of the Danish legation. In the latter part of his life (1792) he contracted a second marriage with Johanna Elisabeth von Dimpfel, whose first husband had been a nobleman named Windhem. He lived in Hamburg until his death, occasionally visiting literary friends in various parts of Germany. A pension was conferred upon him by the prince of Baden, and honorary citizenship by the French revolutionists. His death was looked upon as a national calamity. His funeral (March 22, 1803) was celebrated with the pomp and solemnity generally accorded in Germany only to royal personages. He was buried in the churchyard in the village of Ottensen, near Hamburg, by the side of his Meta. The remains of his 2d wife, who died in 1821, rest in the same cemetery.—The last 2 vols. of his "Messiah" and the greater portion of his odes appeared from 1769 to 1778. He wrote various grammatical and philological works and sacred dramas, or rather dramatic poems, chiefly turning upon characters of the Old Testament, as "The Death of Adam," "Solomon," and "David;" also several patriotic dramas (*Bardieten*), in commemoration of the national hero Hermann. Novalis (Hardenberg) says that Klopstock's works resemble translations from some unknown poet, prepared by a skilful but unpoetical philologist. Goethe remarked in his conversations with Eckermann, that German literature was greatly indebted to Klopstock, who was in advance of his times, but that the times had since advanced beyond Klopstock. Goethe in his autobiography also records his personal impression of Klopstock: "He was of small stature, but well built. His manners were grave and decorous, but free from pedantry. His address was intelligent and pleasing. On the whole, one might have taken him for a diplomatist. He carried himself with the self-conscious dignity of a person who has a great

moral mission to fulfil. He conversed with facility on various subjects, but rather avoided speaking of poetry and literary matters." Among the various editions of his works is that of Leipsic (12 vols. 18mo., 1823), the 11th volume of which contains the posthumous writings of his first wife. Among the English translations of the "Messiah" is one into prose by Mrs. and Mr. Collyer, and the most recent metrical translation appeared in London in 1825-'6. The "Death of Adam" and "Solomon" were also translated into English, as well as his "Odes," the latter by W. Nind (London, 1848).—See also Miss Benger, "Klopstock and his Friends" (London, 1814); Mörike, *Klopstock in Zürich* (Zürich, 1851); and a French essay on him by Dietz (Paris, 1859).

KMETY, or KMETTY, GYÖRGY, a Hungarian general, born near Rima-Szombat, in the county of Gömör, in 1810. He became an orphan at the age of 6, and being destined for an ecclesiastical career, studied at the Protestant schools of Eperies and Presburg. In consequence of a disappointment he entered the Austrian army, and was an officer at the outbreak of the revolution of 1848. He ardently espoused the cause of his country, and by his valor and proficiency in military science rose to the rank of general, coöperated for some time with Görgey, and distinguished himself by the victory of Csorna (June 18, 1849), in which the Austrian lieutenant field marshal Vyas lost his brigade and life. He separated from the main body of the army of the Danube after the loss of Raab (July 28), joined the army of the south, and subsequently fought under Dembinski in the disastrous battle of Temesvár (Aug. 9). One of the last defenders of Hungary on the battle field, he soon after fled with Kossuth and Bem to Turkey, adopted together with the latter the Mohammedan religion, was made pasha under the name of Ismail, and during the Russian war distinguished himself by his eminent services and personal bravery in the defence of Kars against Muravieff (1855). When the town was compelled by famine to surrender, he withdrew to Erzroom, and has since maintained his position in the Turkish service.

KNAPP, ALBERT, a German poet, born in Würtemberg in 1798. After becoming pastor of Stuttgart, he applied himself to poetry, especially to the composition of hymns, which are esteemed the best written in Germany in his time. He published a small volume of them annually between 1833 and 1853, under the title of *Christoterpe*. Among his other publications are three collections of poems (Stuttgart, 1829, 1834, and 1843), and *Evangelischer Liederschatz für Kirche und Haus* (1837; 2d ed. 1850), a valuable collection from the liturgies and hymns of every Christian century, to which his *Christen-Lieder* (1841) was a supplement.

KNAPP, GEORG CHRISTIAN, a German theologian, born in Halle, Sept. 17, 1753, died there, Oct. 14, 1825. He was educated in the orphan school at Halle, founded by Francke, of which

his father was director, and in the universities of Halle and Göttingen. In 1777 he became extraordinary, and in 1782 ordinary professor of theology at Halle, in which office he remained till his death; and he was also associated with Niemeyer as director of the charitable establishments founded by Francke. As a theologian he maintained a system of rational supernaturalism, seeking to harmonize revelation with the theoretical and the practical reason. His *Vorlesungen über die Christliche Glaubenslehre* has been translated into English, with additions, by Leonard Woods, jr., D.D.

KNAPP, SAMUEL LORENZO, an American author, born in Newburyport, Mass., in 1784, died in Hopkinton, July 8, 1838. He was graduated at Dartmouth college in 1804, studied law, and was admitted to the bar of Massachusetts. He made his first appearance as an author in "Travels of Ali Bey" (18mo., Boston, 1818), a work purporting to give an eastern traveller's experiences of society in Boston and Cambridge. It was followed in 1821 by "Biographical Sketches of Eminent Lawyers and Statesmen and Men of Letters;" and in 1828 the author, having previously been connected as editor or contributor with several literary journals, established himself in New York in the practice of his profession. Among his remaining works are: "Lectures on American Literature" (New York, 1829); "Sketches of Public Characters" (12mo., New York, 1830); "American Biography" (1833), consisting of original biographical sketches of distinguished Americans, full of anecdote, and constituting a valuable addition to this department of literature; and "Female Biography of different Ages and Nations" (12mo.). He was also the author of a variety of occasional public addresses.

KNELLER, SIR GODFREY, an English portrait painter, born in Lübeck, Germany, in 1648, died in London in Oct. 1733. He was instructed in painting by Rembrandt and Ferdinand Bol in Amsterdam, and afterward in Rome by Carlo Maratti and Bernini, and gained some reputation in Italy, particularly in Venice, for historical compositions. He arrived in London in 1674, and, having obtained an introduction to the king through the duke of Monmouth, was permitted to paint the royal likeness. The manner in which this was executed procured him abundant employment. Upon the death of Sir Peter Lely he was appointed court painter to Charles II., an honor confirmed by each successive sovereign during the life of the artist. He was knighted by William III., and painted the beauties of his court (which however are considered much inferior to Sir Peter Lely's beauties of the court of Charles II.), and was made a baronet by George I. He painted not less than 10 sovereigns, and an immense number of lesser celebrities. So numerous were his commissions that he was frequently only able to finish the faces of his portraits, leaving the draperies and accessories to be painted by others. He was

a covetous man, and acquired considerable wealth. His portraits possess greater value as likenesses of historical personages than as works of art. He is said to have left at his death 500 unfinished portraits on which he had received half the price in advance.

KNIAZIEWICZ, KAROL, a Polish general, born in Courland, May 4, 1762, died in Paris, May 9, 1842. He was educated at the military school of Warsaw, entered the army at the age of 16, and in the war which preceded the 2d partition of Poland he fought bravely against the Russians, especially in the battle of Dubienka (1792). When, simultaneously with Kosciuszko, Madalinski raised the banner of independence in 1794, Kniaziewicz was among the first to join him, distinguished himself in the relief of Warsaw, rose to the rank of brigadier-general, and commanded under the dictator in the battle of Maciejowice, the unfortunate issue of which made both captives, and sealed the fate of the revolution. After a few years' imprisonment in Kiev, he was restored to liberty by the czar Paul on his accession to the throne, and hastened to join Dombrowski in Italy, where he received the command of the 1st Polish legion. With this he performed prodigies of valor in the war of 1798, especially at Calvi, Terracina, Gaëta, which he captured, and at the taking of Naples. He subsequently fought at the head of another Polish legion in Germany; but when Napoleon disappointed the hopes of the Polish patriots by the dissolution of their legions, and even sent the bulk of these troops to perish in the expedition against Hayti, he resigned and retired to an estate in Lithuania. In 1812 he again entered the French army, serving under Prince Poniatowski in the Russian campaign. He distinguished himself in the battles on the Moskva, at Viazma, and during the disastrous passage of the Berezina, where he was wounded. After the war, refusing to serve under Alexander, he lived in Dresden. His participation in a secret society, which aimed at the restoration of Polish independence, led to a demand of extradition on the part of the czar Nicholas, which was not consented to by the king of Saxony, though he was subjected to a trial by Russian commissaries in the fortress of Königstein. His age preventing him from taking part in the revolutionary war of 1831, he endeavored in vain to serve his country as a diplomatist at Berlin and Paris. The promises of Gen. Sebastiani, the French minister of foreign affairs, which he received as ambassador, only served to hasten the final downfall of Poland. He remained an exile in Paris, where his name is inscribed on the triumphal *arc de l'étoile*.

KNIAZNIN, FRANCISZEK DYONIZY, a Polish poet, born in the ancient palatinate of Vitebsk, Oct. 4, 1750, died at Konskawola, near Pulawy, Aug. 25, 1807. He studied at the college of the Jesuits in Vitebsk, entered that order, and after its suppression repaired to Warsaw, where he found employment in the Zaluski library, and

eventually became secretary to Prince Adam Czartoryski. An unfortunate passion for the eldest daughter of his patron, however, and the tragic events which brought about the fall of his country, plunged Kniaznin into deep melancholy, which passed into derangement toward the close of his life. His works, of which there are various collections, comprise songs, idylls, fables, several larger poems, and translations. Some of his lyrics belong to the most charming productions of that kind in the Polish literature of his time.

KNIGHT, CHARLES, an English publisher and author, born in Windsor in 1791. His father was a bookseller at Windsor, and he succeeded to the business. His first publication, which he edited in conjunction with Mr. E. H. Locker, was "The Plain Englishman," a periodical (3 vols., 1820-'22). At Windsor, in 1823, he commenced "Knight's Quarterly Magazine," and continued it in 1824 in London, whither he then removed. This work, in 3 vols. 8vo., contains the earliest literary productions of Macaulay, Præd, Moultrie, and others. In 1827-'8 he published a continuation of "The London Magazine," in which a few years earlier had appeared Carlyle's "Life of Schiller," and De Quincey's "Confessions of an English Opium-Eater." Soon afterward he became connected with the society for the diffusion of useful knowledge, as their publisher and agent, and immediately undertook a series of valuable works, under the sanction of the society, but generally at his own risk and expense. Foremost were the "Penny Magazine," in 3 series (1832-'45), which at one time enjoyed a circulation of nearly 200,000 copies weekly; the "British Almanac," and "Companion to the Almanac," begun in 1828 and still continued; the "Penny Cyclopædia" (30 vols. small fol., 1833-'56), since condensed as the "National Cyclopædia;" the "Library of Entertaining Knowledge," to which he contributed a volume on "The Elephant" (1831); the "Pictorial History of England," by Craik and Macfarlane, with its continuation entitled "History of the Thirty Years' Peace," by Mr. Knight and Miss Martineau (1840-'50); and the "Gallery of Portraits of Distinguished Men." Several of the above works were edited by Mr. Knight, and all enjoyed much of his supervision. He has also edited the "Pictorial Bible" (4 vols. 4to., 1838); the "Pictorial Book of Common Prayer" (1838); the "Store of Knowledge" (8vo., 1841); "London Pictorially Illustrated" (6 vols. 8vo., 1841-'4; abridged into the "Cyclopædia of London," 1851); "Old England, a Pictorial Museum of National Antiquities" (2 vols. fol., 1845); the "Weekly Volume," a series extending to 126 vols. (18mo., 1843-'5); "Half Hours with the Best Authors" (4 vols. 8vo., 1847-'8); "The Land we Live in" (4 vols. 8vo., 1848); "Cyclopædia of the Industry of All Nations" (1851); "Half Hours of English History" (2 vols., 1853); "Geography of the British Empire" (2 vols. 8vo., 1853), &c. He has won a

position as a Shakespearean scholar by his "Pictorial Shakspeare," including a biography and a "History of Opinion, with Doubtful Plays and Index" (8 vols. 8vo., 1839-'41; library edition, 12 vols. 18mo., 1842-'4; national edition, with biography and "Studies," 8 vols. 8vo., 1851-'58); "Plays and Poems, with Glossarial Notes" (7th ed., 1 vol. 8vo., 1857); "Companion Shakspeare" (8 vols. 12mo., 1855-'7), &c. In 1854, having purchased the plates of the "Penny Cyclopædia," Mr. Knight began the "English Cyclopædia," based upon that work, but greatly enlarged and modified, which is to be completed in 20 vols. 4to. His own writings more especially are: "Results of Machinery" (1830), and "Rights of Industry, Capital, and Labor" (1831), amalgamated and enlarged under the title of "Knowledge is Power" (1855); "Life of Caxton" (1844), enlarged under the title of "The Old Printer and the Modern Press" (1854); "Varieties" (1844); "New Lamps for Old: Remarks on Mr. Collier's Discovery of the Annotations on Shakspeare" (1851); "Once upon a Time" (1854), a collection of his miscellaneous works; and "The Struggles of a Book against Excessive Taxation," and "The Case of the Authors as regards the Paper Duty," pamphlets which confessedly have largely contributed to the repeal of the English duty upon paper, as proposed in Mr. Gladstone's budget of 1860. In 1856 appeared the first volume of "The Popular History of England, an Illustrated History of Society and Government from the Earliest Period to our own Times." This work, the most important of Mr. Knight's writings, is to be completed within the present year (1860) in 8 vols. 8vo., bringing the British annals down to the repeal of the corn laws in 1846. Mr. Knight's whole life has been one of useful and intellectual labor, and it is not too much to say that he is the founder of that description of literature, cheap but good, which has exercised a very beneficial influence on the minds of his countrymen during the last 30 years. His success as a man of business has not been equal to his enterprise. His labors, however, have recently been rewarded by the appointment, through the influence of Lord Brougham, of publisher of the "London Gazette," almost a sinecure, at £1,200 a year.

KNIGHT, RICHARD PAYNE, an English author, born at Wormsley Grange, Herefordshire, in 1750, died in London, April 24, 1824. Being a sickly child, he was not put to school, nor allowed to study either Latin or Greek at home. In 1764, however, upon the death of his father, he was sent to a grammar school, and in the course of a few years obtained a thorough knowledge of Latin and Greek, the latter language becoming thenceforth one of his chief studies. Visiting Italy about 1770, he derived from the contemplation of its monuments of art, ancient and modern, an absorbing taste for the fine arts, and particularly for Greek sculpture. Upon attaining his majority he came into possession of a large property, and from 1780 to 1806 held a

seat in parliament, during the last 20 years as member for the borough of Ludlow, in which he owned a large estate. In 1814 he was appointed a trustee of the British museum, to which institution his unique collection of antiquities, consisting chiefly of ancient bronzes and Greek coins, and valued at £50,000, was bequeathed. His admiration of Greek art having directed his attention to those subjects which illustrate it, he published in 1786 "An Account of the Remains of the Worship of Priapus lately existing at Isernia, in the Kingdom of Naples; to which is added a Discourse on the Worship of Priapus, and its connection with the Mystic Theology of the Ancients" (4to.). This work was privately printed, and was attacked on the score of its indelicacy, notwithstanding the author's object was simply to elucidate an obscure point in Greek mythology. In 1791 appeared his "Analytical Essay on the Greek Alphabet" (4to.), in which he broached some opinions of questionable value on the use of the digamma, and also exposed the forgery of certain inscriptions claimed to have been found by Fourmont in Laconia, and which had deceived Winckelmann, Heyne, and some of the best scholars of the age. He next attempted poetry, and published in 1794 a didactic poem entitled "Landscape," followed by "The Progress of Civil Society" (4to., 1796), "A Monody on the Death of the Right Honorable C. J. Fox" (8vo., 1806-'7), and "Alfred, a Romance in Rhyme" (8vo., 1823), no one of which rises above mediocrity. In 1805 appeared his "Analytical Inquiry into the Principles of Taste" (8vo.), a work characterized by refinement and acuteness of thought, and which proved the most popular of all his publications. His edition of the Iliad and Odyssey, with prolegomena, in which he attempted to restore the digamma, and to relieve the text of the interpolations of later rhapsodists and poets, is now considered of little authority. He was at different times engaged in literary controversies having reference to Greek literature, art, and archæology, and was an occasional contributor to the "Classical Journal," "Archæologia," &c. The prefaces and descriptions of "Specimens of Ancient Sculpture selected from different Collections of Great Britain by the Society of Dilettanti" (fol., 1809-'35) were also written by him.—THOMAS ANDREW, brother of the preceding, a vegetable physiologist, born Oct. 10, 1758, died in London, May 11, 1838. He was graduated at Balliol college, Oxford, and subsequently devoted much time to experiments in vegetable and animal physiology. Some suggestions as to the means of propagating fruit trees, communicated to the royal society in 1795, brought him into great repute as a vegetable physiologist. In 1797 he published "A Treatise on the Culture of the Apple and Pear, and on the Manufacture of Cider and Perry," in which the same subject is further developed; and in 1811, "Pomona Herefordiensis, or Natural History of the old Cider and Perry Fruits of the

County of Hereford." He was a frequent contributor to the "Transactions" of the horticultural society, of which he was for many years president, and to his efforts the rapid progress of horticulture in England during the present century is in a great measure to be ascribed. After his death appeared a collection of his physiological and horticultural papers (8vo., London, 1841).

KNIGHTHOOD. See CHIVALRY.

KNIGHTS OF THE SHIRE, a designation given to representatives in the British house of commons of counties at large, as distinguished from those of cities and towns ranking as counties. The origin of county representation is disputed. Traces of it are found at various periods as early as the reign of John; it certainly existed in 1265 (49th of Henry III.), when Simon de Montfort summoned a parliament in the king's name.

KNIPPERDOLLING, BERNHARD, one of the leaders of the Anabaptists in Münster, born near the end of the 15th century, executed Jan. 23, 1536. Exiled for several years from his native town, he adopted in Sweden the doctrines of the Anabaptists. On his return to Münster, he united with Rothmann and Matthyszoon, and being wealthy was able by the favors which he granted to unite the poorer inhabitants against the rich. He was imprisoned, but released by his partisans, and succeeded in banishing the nobility, clergy, and many of the most influential citizens from the city. A council was chosen in 1534, in which the Anabaptists were predominant, and they immediately filled all public offices with their adherents, made Knipperdolling first burgomaster, and proclaimed an equality of estates, polygamy, and community of goods. All who refused to cooperate with them were driven from the city or slain. Knipperdolling was subsequently proclaimed stadtholder, and John of Leyden king, it being prophesied that the latter should be victorious over all the princes and principedoms of the earth. The city was surprised by a Catholic army in 1535, and captured after a contest in which 5,000 men perished. Knipperdolling was taken prisoner, and put to death with fearful torture, which he endured with extreme inflexibility. The iron cages in which his body and the bodies of his fellow sufferers were suspended still hang from the tower of St. Lambert's church.

KNOBLECHER, IGNAZ, a German traveller, and Roman Catholic vicar apostolic of central Africa, born in Laybach about 1815. He was educated at the Propaganda in Rome with a view to devoting himself to the African mission, and after having been ordained went to Syria, where he passed a year in the study of Arabic. Thence he removed to Khartoom in Sennar, on the Nile; and in 1849 was ordered to ascend that river and establish a mission among some negro tribes near the equator. Accompanied by another priest, Father Angelo Vinco, he set out, Nov. 13, with the trading party which annually goes up the Nile, and on Jan. 14, 1850, reached the rapids in lat. 4° 49' N., the furthest point

yet reached by any expedition. Father Knob-lecher, however, succeeded in stemming the rapids, and on the 16th reached the village of Logwek, in lat.  $4^{\circ} 10'$ . Climbing a solitary granite peak 600 feet high, from which the village is named, he traced the course of the river toward the S. W. until it was lost from sight between the mountains Rego and Kidi. Beyond these, on the verge of the horizon, rose a range of hills scarcely visible in the distance, which probably lie under the parallel of  $8^{\circ}$  N. The width of the river was here 650 feet, and its depth from 5 to 8 feet, although it was the dry season. After a stay of one day at Logwek, Dr. Knob-lecher was forced to return with the trading party to Khartoom, the jealous merchants having inspired the natives with such a dread of the missionaries, that the chiefs would not allow them to remain, lest they should bewitch the country. He examined the Bahr el-Ghazal or Gazelle river, which Berghaus maintains to be the true Nile, and found it an unimportant stream with a scarcely perceptible current; he regards the White Nile as undoubtedly the true river. Dr. Knob-lecher soon afterward visited Europe, and while in Germany published an account of his explorations. Returning to Africa, he fixed his residence at Khartoom, and, having received the appointment of vicar apostolic, now exercises the government of the church in central Africa.

KNOT, the European name of a sandpiper of the genus *tringa* (Linn.), one of the few birds common to the old and new worlds; other names are the ash-colored, red-breasted, gray-backed, and robin snipe; it is the *T. canutus* (Linn.). The length is about 10 inches, the extent of wings 20, the bill  $1\frac{1}{2}$ , and the weight 6 ounces; it is the largest of the genus in the United States. The color of the summer plumage is light gray above, with black and pale reddish spots; rump and upper tail coverts white, with narrow bands and crescents of black; below light brownish red, with under tail coverts, thighs, sides, and under wing coverts white, spotted and barred with brownish black; quills brownish black, with white shafts; tail brownish cinereous, each feather white edged. In winter the upper parts are darker, with brownish black edgings; below dull ashy white, lightest on abdomen, with numerous longitudinal dark brown lines and spots on the breast and neck. The knot is found throughout eastern North America and Europe. It is a very active bird, nimbly running and wading along the edge of the waves on sandy beaches, searching for minute shell fish and marine worms; the flight is swift, and large flocks perform very beautiful and rapid aerial evolutions. The flesh of the young and fat birds is considered a delicacy.

KNOOT, properly KNOT, the Russian word for whip, and the name of the severest judicial punishment inflicted in Russia. The culprit is bound to two stakes, and receives on his bare back the specified number of lashes from a whip of plaited thongs interwoven with wire; 100 to

120 lashes are considered equivalent to a sentence of death. The whipping is inflicted by the hands of a convict respited from Siberia and kept in prison for that purpose. Should a culprit survive this punishment, he is banished for life to Siberia. Formerly the nose was slit, the ears were cut off, and the letter V, for *Vor* (rogue), was branded on the forehead; but this aggravation was abolished by Alexander I. The nobility are legally exempt from the knot, but the privilege has not always been respected. Although the punishment is still in use in the Russian army, it is now rarely resorted to, excepting in the infliction of a limited number of blows, usually from 8 to 10, and more with the view of disgracing than injuring the soldier.

KNOWLES, JAMES DAVIS, an American clergyman and author, born in Providence, R. I., in July, 1798, died in New York, May 9, 1838. His father, Edward Knowles, a respectable mechanic of Providence, apprenticed him at the age of 12 to a printer, with whom he remained till after he had attained his majority. From his scanty wages he not only clothed himself and purchased books, but laid up something for the express purpose of an education to which he looked forward. While but a lad he studied French without a teacher, and learned to read it with facility. When he entered college he knew more of Latin than is known by most American graduates on taking college honors. He had a keen relish for elegant literature, and early exhibited in his compositions great purity of style. Immediately on becoming of age he became co-editor with the late Prof. Goddard of the "Rhode Island American." Here he pursued his studies, and indulged his literary tastes, occasionally amusing his leisure hours with writing poetry. The stanzas which he added to Gray's "Elegy," to supply what he deemed its melancholy deficiency in respect to religious sentiment, furnish a remarkable specimen of imitative verse. While editor he added the study of Greek to that of Latin and French, and at a later period he made respectable progress in Hebrew and German. At the age of 22 he was received into the communion of the first Baptist church in Providence, and appeared as a candidate for the ministry. He entered the sophomore class of Columbian college, Washington, D. C., in 1822, and edited at the same time a weekly religious newspaper, called the "Columbian Star." He was graduated in 1824, and immediately appointed tutor, but soon abandoned this position, and in Dec. 1825, was ordained pastor of a church in Boston. In 1832 he was called to the chair of pastoral duties and sacred rhetoric in the Newton theological institution. In 1836 he founded the "Christian Review," a quarterly journal of the Baptist denomination. Visiting New York in the latter part of April, 1838, to attend the anniversaries of his denomination, he took the small pox, and died in the 40th year of his age. Mr. Knowles's principal works are, a "Memoir of Mrs. Ann H. Judson" (57th thousand, Boston,

1857), and a "Memoir of Roger Williams, Founder of Rhode Island" (Boston, 1884).

KNOWLES, JAMES SHEKIDAN, a British dramatist, born in Cork, Ireland, in 1784, the son of James Knowles, a lecturer on elocution. In 1792 the family removed to London, and 4 years later young Knowles produced his first play, a juvenile performance in which he and a number of young amateurs took part. Soon after he made the acquaintance of William Hazlitt, whose conversation and advice were of great service in developing and directing his dramatic tastes. To Charles Lamb he was also indebted for many useful hints. At the age of 22 he determined to make the stage his profession, and, against the earnest persuasions of his friends, made his debut in the Crow street theatre, Dublin, of which city he was then a resident. For about 10 years he led an unsettled life, sometimes as an actor, sometimes as a teacher of elocution, and with but moderate success in either occupation. He wrote nothing for the stage particularly worthy of mention until 1815, when his "Caius Gracchus" was produced in Belfast with great success. His next play, however, "Virginius," in which Macready sustained the leading part at Drury Lane, first made him generally known to the dramatic public; and thenceforth for many years he was one of the leading playwrights in England. His "Beggars of Bethnal Green," "Hunchback," and "Wife" followed; and in the two latter, which are still popular on the stage, the author appeared in leading characters. He now assumed the twofold character of actor and author, and after engagements in various parts of the United Kingdom made a successful tour in the United States. On his return to England he produced "The Love Chase," "Woman's Wit," "The Maid of Mariendorp," "Love," "Old Maids," "John of Procida," "The Rose of Aragon," and "The Secretary," all of which enjoyed a fair degree of success, while some are still standard acting plays. His health began to fail after this, and in 1849 a pension of £200 was procured for him, it being represented that the profits of his dramatic writings had never equalled this sum per annum. Of late years Mr. Knowles has abandoned the stage for the pulpit, and is known as a zealous and eloquent preacher of the Baptist denomination. Two polemical works, "The Rock of Rome," and "The Idol Demolished by its own Priest," testify to the energy with which he employs his pen in this new calling. He is also the author of two novels, "George Lovel" and "Henry Fortescue," which are much inferior in merit to his plays. By the latter, which are written on the model of the Elizabethan dramatists, he is almost exclusively known. They have been collected and published in England in 8 vols. (London, 1841-'8).

KNOX, the name of 7 counties in the United States. I. A N. W. co. of Texas, near the head of Brazos river, by which stream and the Big Wichita it is drained; area, about 1,200 sq. m. Most of the surface is hilly and broken, but in

the S. part there is an undulating mezquit prairie. Gypsum is so abundant as to render the water of most of the streams unfit for drinking, and the Wichita and Brazos are contaminated by deposits of salt near their sources. Timber is not abundant; the principal varieties are mezquit and cedar. The soil is a red loam suitable for pasturage and grain. The county was organized during the legislative session of 1857-'8. II. An E. co. of Tenn., watered by Clinch, Holston, and French Broad rivers; area, 575 sq. m.; pop. in 1850, 18,755, of whom 2,198 were slaves. The surface is mountainous, being crossed by Copper ridge, Chestnut ridge, and Bay's mountain. Iron ore, limestone, and marble are abundant, and the soil of the lowlands is fertile. The productions in 1850 were 861,708 bushels of Indian corn, 256,890 of oats, 27,867 of sweet potatoes, 20,331 lbs. of tobacco, and 176,916 of butter. There were 57 grist mills, 18 saw mills, 7 tanneries, 4 newspaper offices, 40 churches, and 2,500 pupils attending public schools. Capital, Knoxville. III. A S. E. co. of Ky., bordering on Tenn. and traversed by Cumberland river; area, 600 sq. m.; pop. in 1850, 7,050, of whom 612 were slaves. It abounds in iron ore, coal, and limestone, and has a mountainous surface. The productions in 1850 were 290,965 bushels of Indian corn, 2,526 of wheat, 48,341 of oats, 16,869 lbs. of tobacco, 18,766 of wool, and 9,884 of flax. There were 8 grist mills, 1 saw mill, 18 churches, and 975 pupils attending schools. Capital, Barbourville. IV. A central co. of Ohio, drained by Vernon and Walhonding rivers and the N. fork of Licking river; area, 525 sq. m.; pop. in 1850, 28,873. The surface is undulating, and the soil, particularly in the W. part, is remarkably fertile. The productions in 1850 were 728,729 bushels of Indian corn, 289,177 of wheat, 206,144 of oats, 281,318 lbs. of wool, 65,200 of tobacco, and 498,877 of butter. There were 25 grist mills, 28 saw mills, 9 woolen factories, 8 tanneries, 6 newspaper offices, 64 churches, and 6,315 pupils attending public schools. The Sandusky, Mansfield, and Newark, and the Springfield, Mount Vernon, and Pittsburg railroads connect at Mount Vernon, the capital. V. A S. W. co. of Ind., bordering on Ill., bounded W. by the Wabash river, S. by White river, and E. by the W. fork of the latter stream; area, 518 sq. m.; pop. in 1850, 11,084. It has a level surface, occupied in the W. part by prairies, and contains beds of coal. The soil is very fertile. The productions in 1850 were 720,725 bushels of Indian corn, 27,187 of wheat, 51,010 of oats, 2,783 tons of hay, and 21,941 lbs. of wool. There were 12 grist mills, 8 saw mills, 1 newspaper office, 22 churches, and 1,600 pupils attending public schools. Capital, Vincennes. VI. A N. W. co. of Ill., drained by Spoon river; area, 729 sq. m.; pop. in 1855, 22,700. It has an undulating surface, diversified with prairies and woodlands, a fertile soil well watered by creeks, and extensive beds of coal. The productions in 1850 were 1,370,361

bushels of Indian corn, 201,481 of wheat, 227,718 of oats, 13,164 tons of hay, and 67,849 lbs. of wool. There were 10 grist mills, 18 saw mills, 8 newspaper offices, 14 churches, and 2,448 pupils attending public schools. Capital, Knoxville. The Chicago and Burlington, Northern Cross, and Peoria and Oquawka railroads meet at the flourishing city of Galesburg in the W. part of the county. Galesburg (pop. in 1858, 7,000) has grown with great rapidity during the last few years, and is now the seat of considerable manufactures, and of Knox college, Knox female college, and Lombard university. In 1858 it contained 2 newspaper offices, 2 steam flouring mills, a steam sash and door factory, a steam saw and planing mill, a large foundry and machine shop, a bank, and a number of hotels. It is well built, and has wide regular streets. VII. A N. E. co. of Mo., drained by the N., S., and Middle Farius, and the N. fork of Salt river; area, 512 sq. m.; pop. in 1856, 5,484, of whom 266 were slaves. It has a nearly level surface diversified with woods and prairies, and a fertile soil. The productions in 1850 were 216,027 bushels of Indian corn, 20,906 of wheat, 26,639 of oats, and 1,878 tons of hay. There were 4 grist mills, 3 saw mills, 1 church, and 124 pupils attending public schools. Capital, Edina.

KNOX, HENRY, an American general and statesman, commander of the artillery during the revolution and secretary of war under Washington, born in Boston, July 25, 1750, died in Thomaston, Me., Oct. 25, 1806. He was of Scotch and Irish Presbyterian stock, and his father came from St. Eustatius, one of the British West India islands. He received the common school education of his time in Boston, and was remarked as a youth of fine abilities and generous disposition, fond of the heroic examples of former ages, and, according to Dr. Eliot, who was nearly his contemporary, giving constant presage of future eminence. Of a robust and athletic frame and an enterprising and resolute character, he was foremost in the contests between the North and South ends, to the latter of which he belonged; and Mr. Tudor relates that once, in the frolicsome celebration of Pope's night, the wheel of the carriage which sustained the cumbrous pageant having given way, he substituted his own shoulder and bore the vehicle without interruption through the fray. He had the mishap to mutilate one of his hands in a shooting excursion upon the islands, a defect which he was accustomed to cover up by the folds of a handkerchief, and which in Stuart's full-length portrait in Faneuil hall is skilfully avoided by the resting of the arm on a cannon. He was brought up to the business of a bookseller, and had a thriving trade, his shop being a favorite resort of cultivated persons. On the day of the Boston massacre he accosted Capt. Preston, and earnestly urged him not to fire on the crowd. He was a member of the famous artillery company of Major Adino Paddock, which afterward furnished a large proportion of the ablest officers of the

Massachusetts artillery. He was also an officer in the corps of grenadiers commanded by Major Dawes, which attracted the attention and won the applause of the British officers. By availing himself not only of the practical advantages about him but of his opportunities for obtaining and perusing military books, he became an adept in military science. Among those who frequented his store was Miss Lucy Fluker, an attractive daughter of the provincial secretary. The result was her marriage with the young bookseller, which in consequence of the opposition of her friends wanted little of an elopement. They regarded her social prospects as ruined by wedding one who had embraced the cause of the rebellion, but after the revolution she became a principal ornament of the first social circle in America. Shortly before the battle of Bunker hill he managed with some difficulty to escape the guards of Gen. Gage with his wife, and to make his way to Cambridge with his sword carefully concealed in the folds of her dress, thus eluding the requisition for every citizen to surrender his arms before leaving the town. He was actively engaged in the battle of Bunker hill as a volunteer aid to Gen. Ward, reconnoitring the movements between the heights and the head-quarters; and upon his reports Ward issued his orders. He soon attracted the attention of Washington by his skill as an engineer in planning and constructing the fortifications that were thrown up, and by his aptness as an artillerist. Attached to the regiment of artillery which had been formed under the veteran Gridley, he was soon raised to its command, in accordance with the recommendation of Washington, by the unanimous voice of the whole corps, and with the full consent of Gridley, who was deemed too old for active service. He was next employed on a mission to the forts in the region of the lakes in quest of cannon and ordnance stores. He successfully struggled with all kinds of difficulties in the dead of winter, and returned to camp early in 1776 with a long train of sledges drawn by oxen and bearing more than 50 cannon, mortars, and howitzers, which proved of great service in the siege and bombardment of Boston. The next movement of his corps was with the main body of the army to New York, where he had his quarters at the Battery close by those of Washington. There he took the management of all the artillery, constantly attending to its distribution and details, crossing daily with Washington to the encampment on Long island to superintend the duties of his department on that side, and during the retreat was prominently engaged in the removal of the troops and weighty materials further up the North river. He was almost the last officer to leave the city, remaining so late that he escaped capture only by seizing a boat and making his way by water. His arrival at Harlem, where great anxiety was felt for his safety, was greeted with a shout of welcome, and an embrace from Washington. He was one of the officers who witnessed with Washington the at-

tack upon Fort Washington, arriving too late to avert the catastrophe. In the subsequent weary progress through New Jersey he explored the upper region of that state, marking suitable sites for the position of the army in the coming emergencies of the campaign. He attended to the artillery in the crossing of the Delaware, and also rendered valuable services by his stentorian voice, giving orders that were heard above the tempest. He and Greene were for following up the victory at Trenton by marching directly upon New Brunswick and anticipating the advance of the enemy, but were overruled by the prudence of Washington. His well directed cannonade repulsed Cornwallis in repeated attempts to pass the Assunpink (Jan. 2, 1777). He shared in the night march which succeeded, and in the brilliant action at Princeton on the following day. At this critical period it was by the advice of Knox, who had been advanced by congress to the rank of brigadier-general of the artillery, that Washington selected the position of his final winter encampment on the high grounds in the vicinity of Morristown. He was sent to Massachusetts to expedite the raising of a battalion of artillery, and became the organ of communication with the executive council of the state concerning the military events of that year. On his return he was employed with Gen. Greene (May 12) on a visit of inspection to the forts and passes of the highlands, to guard against the designs of the enemy in that quarter, and to prevent the interruption of communication with the eastern states. His standing in the service was for a moment disturbed by the ambition of the foreign officer Ducoudray to obtain the command of the artillery. An urgent remonstrance was presented, and Washington offered a testimonial to the worth of Knox as "a man of great military reading, sound judgment, and clear perceptions," who, "combating almost innumerable difficulties, had placed his department on a footing of the greatest honor to himself and advantage to the public." The chivalric career of Ducoudray was brought to an untimely close by the plunge of his high-mettled steed into the Schuylkill, while hastening as a volunteer to the battle of Brandywine. In that battle the fire of the artillery against Knyphausen at Chad's ford was maintained with vigor from morning till evening; and though the day was adverse and several pieces were lost, Knox always spoke of the action with pride. The failure at Germantown was partly attributed to his tenacious adherence to the military maxim never to leave an enemy's fort in the rear, causing the pursuit to be abandoned at Chew's garrisoned house. There were other reasons, however, against pressing the advance in the fog and confusion, while superior and fresh forces were coming up from Philadelphia. After the fall of Fort Mifflin, Nov. 15, 1777, he was sent with De Kalb and St. Clair to provide for the security of Red Bank. He passed the winter at Valley Forge, laboring to improve the discipline and efficiency of the army, and was prominently en-

gaged in the hot and long-drawn battle of Monmouth, June 28, 1778, reconnoitring in front while Oswald was using his pieces to check the enemy, rallying the retreat with his powerful voice, and bringing up the rear with a brisk battery planted in the night, and served by his brigade-adjutant Du Plessis. In the general order after the battle Washington had "the satisfaction to inform Gen. Knox and his officers that the enemy had done them the justice to acknowledge that no artillery could be better served than theirs." After the arrival of the French fleet and troops under Rochambeau, Knox accompanied Washington and Lafayette to meet him at Hartford, to mark out their future plans of cooperation, and returned by way of West Point, where he learned the astounding discovery of Arnold's treason and flight. He sat on the court martial for the trial of André. De Ohasstellux, who visited the American camp in 1780, has particularly described the delightful impression produced personally by Knox. In the ensuing winter he was again sent to Boston and to the legislatures and executives of the New England states to urge them to expedite their preparations of men and means for the next campaign. He was present at the second interview between Washington and Rochambeau at Weathersfield to concert measures to be taken against New York and the movement of the army southward to Yorktown; and his skill in forwarding the heavy cannon, ordnance stores, and ammunition, caused Washington to report to the president of congress: "The resources of his genius supplied the defect of means." On the arrival of the French fleet under De Grasse in the Chesapeake, Knox was one of the generals who accompanied Washington on board of the flag ship, to make arrangements for an immediate and combined attack upon Cornwallis. His station at Yorktown during the heaviest part of the cannonade was in the grand battery by the side of Washington. He was now advanced by congress to the rank of major-general, and was commissioned with Gouverneur Morris to arrange the exchange of prisoners and settlement of expenses, and with Heath for the purpose of a general cartel. He was efficient in allaying the discontent of the army at the prospect of its dissolution without pay or security, was head of the committee appointed to memorialize congress on the subject, and proposed the patriotic resolutions in answer to the address of Washington at the Newburg meeting, March 15, 1783. Hamilton indicated him at this crisis as especially possessing the confidence of the army. He was placed in command at West Point after the announcement of the cessation of hostilities, and on him devolved the delicate task of disbandment. From him came the suggestion of the society of the Cincinnati, to perpetuate the friendships formed during the war. Its first draft remains in his handwriting, and he was its secretary-general while Washington was its president. He was appointed to arrange the surrender of New York with Sir

Guy Carleton, and rode by the side of Washington in making the grand entry on the day of its evacuation by the British. At the farewell interview between Washington and the other principal officers he was the first to receive the affectionate embrace of the commander-in-chief, with whom he had been constantly and intimately associated throughout the war. After the peace he was a candidate with Greene and Lincoln for the secretaryship of war, in which office he succeeded the last in March, 1785. There was no separate department for the navy, and its duties therefore devolved chiefly on him. He was much occupied also with Indian affairs and the care of the western posts. He was a frequent correspondent and adviser of Washington, especially concerning the measures leading to the adoption of the federal constitution and matters pertaining to New England. He visited Massachusetts during Shays's rebellion, with Lincoln, to report to Washington its character and progress. He retained his department after the organization of the new government. To him and Col. Humphreys was assigned the task of prescribing the formalities of the republican court. By coinciding with the views of Hamilton on the general policy of the administration, he incurred the displeasure of Jefferson. The military school at West Point was projected when he first took command there, and constantly engaged his interest. The exigency of affairs with France and Algiers, and the defeats of Harmer and St. Clair by the north-western Indians, followed by the victory of Wayne, were among the later objects of his official attention. In Dec. 1795, following the example of Hamilton, he retired from the cabinet in order to attend to his private affairs. When Washington reluctantly accepted his resignation, he gave to him an affectionate and strongly expressed testimonial of the high worth of his services, which Knox lodged in the war office as a public deposit. He then removed to St. Georges in Maine for the improvement of an estate, derived partly in the right of his wife and partly by purchase, upon which he expended large amounts. There he exercised a magnificent hospitality. When in 1798 the army was reorganized at the prospect of war with France, his feelings were deeply wounded by the cabinet's reversal of President Adams's order of appointments, and the precedence assigned to Hamilton in the new military arrangements. His proposal was to serve as aide-de-camp to Washington. Gen. Knox was large in person, of a generous, buoyant, and social disposition, cordially appreciated and beloved by his friends, possessing unquestionable integrity, unsurpassed energy, and a mind liberally cultivated by study.

KNOX, JOHN, the leader of the Protestant reformation in Scotland, supposed to have been born in Gifford, Haddingtonshire, in 1505, died in Edinburgh, Nov. 24, 1572. (The society of antiquaries of Scotland discussed the subject of his birthplace in Jan. 1858, when Mr. John Richardson of Haddington brought forward

evidence that he was born in Giffordgate, a suburb of Haddington, and not in Gifford, a village near that town. He was supported in this view by Mr. Laing, the editor of the reformer's works.) After receiving his preliminary education at the grammar school of Haddington, he was sent in 1521 to the university of Glasgow, where for several years he was instructed in the scholastic philosophy and theology, while the reforming opinions were spreading through the country. Noted as a master of dialectic subtleties, he was ordained prior to 1530, and became a teacher of philosophy at St. Andrew's. The study of the fathers, especially of Jerome and Augustine, had shaken his religious opinions as early as 1535, but it was not till 1542 that he became an avowed and marked reformer. At that time many persons of his acquaintance, "earls, barons, gentlemen, honest burghesses and craftsmen," had either secretly or openly embraced the new creed. The long period of silence, before in mature age he explained his views with singular zeal, decision, and completeness, has been regarded as proof that he was naturally of a prudent and peaceful disposition, and not a turbulent partisan. His reprehension of certain practices of the church caused him to retire from St. Andrew's to the south of Scotland, where he was declared a heretic, degraded from his office, and threatened by assassins. In default of more definite occupation, he became tutor to the sons of two noble families, listened to the reformed teachers, and occasionally preached to the inhabitants of the surrounding country. After the death of his friend George Wishart, he remained in retirement till, nearly a year after the murder of Cardinal Beaton, he took refuge with many other Protestants (1547) in the castle of St. Andrew's, which the regent was vainly attempting to reduce. There for the first time he became known as a powerful preacher against the papacy. The regent, reinforced by a French squadron, obliged the garrison to surrender. The terms of the capitulation were violated, and Knox with his comrades was transported to France, where he was imprisoned on the galleys for 19 months. He experienced extreme hardships, and on his release (1549) directed his course to England, where he was appointed to preach at Berwick and at Newcastle, and became one of the chaplains of Edward VI. For the boldness of his discourses he was several times called to account, but he was able to vindicate himself. A bishopric was offered to him, but he declined it from scruples as to the divine authority of the episcopal order. On the accession of Queen Mary he fled from England to Dieppe, and passed thence to Geneva, where, after taking part in the memorable troubles at Frankfurt and after a short visit to Scotland, he became pastor (1556) of a small English congregation. The two years of his residence in Geneva, in the society of Calvin, Beza, and other learned men, were among the happiest of his life. "In other places," he wrote to a friend, "I confess Christ

to be truly preached; but manners and religion to be so sincerely reformed, I have not yet seen in any other place beside." While in Scotland he had been cited to appear before an assembly of the clergy to be held at Edinburgh, but his opponents avoided the discussion when they found him ready to meet it, supported by persons of influence. But after his return to Geneva the citation was renewed, and he was condemned to be burned as a heretic, and the sentence was executed on his effigy. Against this condemnation he published the "Appellation of John Knoxe." He also wrote a tract entitled the "First Blast of the Trumpet against the Monstrous Regiment of Women" (1558), a vehement attack on the political government of women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559, and rejoiced that he had come "even in the brunt of the battle." The queen regent, throwing off all disguise, had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where he preached against the idolatry of the mass and the veneration of images. At the conclusion of the service an encounter between a boy and a priest, who ventured to make the preparations for celebrating the mass, was the occasion of a violent insurrection. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the holy recesses invaded, and the "rascal multitude," as Knox calls them, did not stop till they had sacked and laid in ruins the houses of the Dominican and Franciscan friars and the Carthusian monastery. The queen regent advanced upon Perth with a considerable army, but, finding the Protestants well prepared for resistance, proposed terms of accommodation which were accepted. The Protestants, in order to consolidate their strength, formed a religious bond or covenant, and began to be distinguished as the congregation, and their leaders as the lords of the congregation. Iconoclasm was a prominent feature in the Scottish reformation. Events similar to those at Perth followed at Stirling, Lindores, Cupar, St. Andrew's, and other places. Knox had preached in the cathedral of St. Andrew's against the advice of his friends and the threats of the archbishop, and with such success that the magistrates united with the inhabitants in desolating the churches and monasteries, and in establishing the reformed worship. Meantime civil war raged throughout the kingdom between the regent, assisted by French troops, and the lords of the congregation, who im-

plored the succor of Elizabeth. In political as well as ecclesiastical affairs Knox was a conspicuous adviser, and took up his residence in Edinburgh after an extensive circuit through the southern and eastern counties. After a contest of 12 months, marked by many atrocities, the vigorous assistance rendered by Elizabeth, and the death of the queen regent while the English troops were investing Edinburgh, led to a truce and to the summons of the parliament to settle differences. Parliament assembled in Aug. 1560, and the reformed religion was established, and Roman Catholicism interdicted by law in Scotland. Knox retained the office of minister in the metropolis, and soon after the arrival of the young Queen Mary (Aug. 21, 1561) she summoned the influential and noted reformer to her presence. Six interviews are recorded between him and the queen, and the questions which she raised were discussed by him with an undaunted freedom and rigor, which once drove her to tears. She caused his arrest on a charge of treason in 1563, but all the councillors except the immediate dependents of the court voted for his acquittal. The vehemence of his public discourses led him into frequent difficulties. In 1563 he disputed publicly for 3 days with Abbot Quentin Kennedy at Maybole; in 1565 he quoted certain texts which gave offence to the king (Darnley), and was for a short time prohibited from preaching; he fled from Edinburgh when the queen returned from Dunbar after the death of Rizzio; and he preached a sermon at the coronation of the infant king at Stirling (July 29, 1567). Under the brief regency of Moray, the work of Knox seemed to be completed, and he thought of retiring to Geneva to end his days in peace. After the assassination of Moray, civil and religious confusion returned under the regency successively of Lennox and Mar. Weakened by a stroke of apoplexy in 1570, Knox yet reappeared in the pulpit, while Kirkaldy of Grange and others of his friends were forsaking the cause of the reformation, and while he differed from his brethren in the assembly about praying for the queen. So violent was the enmity excited by his animadversions, that, following the advice of his friends, he left Edinburgh for St. Andrew's, May 5, 1571. He returned in the following year, and his last energies were put forth in denunciations of the perpetrators of the massacre of St. Bartholomew's.—The doctrines of Knox embraced a Calvinistic creed and a Presbyterian polity. The "Order of Geneva," a liturgy which he shared in preparing for the use of the church at Frankfort, and subsequently employed in his congregation at Geneva, was introduced into Scottish Protestant churches in 1565. His character was marked by a stern realism, which could be beguiled by no social pretensions, no conventional dignities, no pompous traditions. From this sprang his scornful bitterness and his insensibility to the social graces and refinements which Mary exhibited personally, and sought to transplant

from Paris to her native land. His preaching was distinguished for a headlong and vehement energy, which, as the English ambassador said, "put more life into him than 600 trumpets." Earnest and intense in every practical direction, his mind was not at all of a reflective or speculative cast, and as a thinker, save perhaps on political subjects, he takes no rank; his political views rather sprang from an instinctive sense than from the development of fundamental principles. The best known of his writings is the "Historie of the Reformation of Religion within the Realm of Scotland" (1586; mutilated ed. by David Buchanan, London and Edinburgh, 1644; complete ed., Edinburgh, 1782). A collected edition of his works, edited by David Laing, is in progress in Edinburgh (6 vols., 1846-'56). The principal biography of him is that by Thomas McOrie (1812; new ed., 1889).

KNOX, VICENTIMUS, an English clergyman and author, born at Newington Green, Middlesex, Dec. 8, 1752, died in Tunbridge, Kent, Sept. 6, 1821. He was educated at St. John's college, Oxford. In 1778 he was elected master of Tunbridge school, and continued for 33 years to preside over that institution. He then settled in London, where his preaching was much admired. He was a voluminous and popular writer, but has been best known as the editor of the compilation entitled "Elegant Extracts." His works, with a biographical preface, were published in London in 1824, in 7 vols. 8vo., including "Essays, Moral and Literary."

KNOXVILLE, a city of Tennessee and seat of justice of Knox co., situated on high ground on the right or N. bank of Holston river, 4 m. below the mouth of the French Broad river, and 185 m. E. from Nashville; pop. in 1850, 3,690; in 1860, about 8,000. The Holston is navigable to this point by steamboats, and the city is the place of junction of the E. Tennessee and Georgia and E. Tennessee and Virginia railroads; another road, now building, will connect it with Lexington, Ky., and various towns in North and South Carolina. It is the principal commercial place of E. Tennessee, and is rapidly growing in size and importance. It is the seat of the state asylum for the deaf and dumb, in which during the 2 years ending July 15, 1857, there were 80 pupils under instruction, and of the university of East Tennessee, founded in 1806. The medical department of the latter institution was established in 1856. Knoxville also contains 3 academies, 8 churches, 4 newspaper offices, 3 banks, a large car factory, a flouring mill, and an extensive manufactory of glass. Knoxville was settled in 1789, and received its name 2 years later in honor of Gen. Henry Knox, secretary of war under President Washington. In 1794 it became the capital of the territory, and it continued to be the seat of the territorial and afterward of the state government until the legislature was removed to Nashville in 1817. In 1794 the first steps were taken toward the establishment at Knoxville of Blount college, the parent of the present university.

KNYPHAUSEN, BARON, a lieutenant-general in the British service during the American war of independence, born in Alsace about 1780, died in Berlin in June, 1789. His father commanded a regiment under the duke of Marlborough, and his own military career commenced in the service of Frederic William I. of Prussia, the father of Frederic the Great. Subsequently he served in the several wars waged by the latter against Austria. In 1776 he received from the British government the command of 12,000 Waldeckers and Hessians hired to aid in repressing the insurrection in the American colonies, and arrived in New York in time to participate in the battle of Brooklyn, Aug. 1776. He was present at White Plains, and aided in the capture of Fort Washington in Nov. 1776, and in the defeat of the American forces at Brandywine in the succeeding year. In June, 1780, being then in temporary command of the British troops in New York, during the absence of Sir Henry Clinton, he made a descent into the Jerseys with 5,000 men, in the hope of rallying the disaffected Americans to the royal standard; but he accomplished little beyond sacking the village of Connecticut Farms. On the 23d he reentered the Jerseys with reinforcements, and attacked the detachment under Greene which occupied Springfield and the heights in the rear. But so skilful were the dispositions of the American general, that after an indecisive conflict the British again returned to Staten island, after burning the village of Springfield. He was a man of fine personal appearance, amiable and simple-minded.

KOALA, a marsupial animal of the phalanger family, and genus *phascogale* (De Blainville), the *P. cinereus* (Fisch.). The dental formula is: incisors  $\frac{2}{1}$ , canines  $\frac{1}{1}$ , premolars  $\frac{1}{1}$ , molars  $\frac{2}{2}$ =30; the posterior upper incisors and canines are small, and the crowns of the molars have 4 tubercles. The body is stout; the head moderate, with a very short facial portion and naked muffle; ears moderate and clothed with long hairs; eyes large and not protected by lashes; moustaches small and scanty. The toes of the fore feet are in 2 sets, one composed of the 2 inner (which are the shortest), and the other of the 3 outer, of which the central is the longest, and all have long, curved, and compressed claws; the two portions of the feet are slightly opposable; the 1st toe of the hind feet is very far back, large, and without a nail. The stomach is provided with a cardiac glandular apparatus, and the cæcum is 3 times as long as the animal; the pouch is well developed; the tail is wanting. The koala is about 2 feet long, 10 or 11 inches high, with a girth of 18 inches; the limbs are powerful, and the large hands and feet admirably adapted for climbing trees; the fur is dense, soft, and woolly, of a general ashy gray color, inclining to brown; hinder part of back dirty yellowish white, under parts dirty white, and inside of hind limbs rusty brown. It inhabits New South Wales, where the natives

bunt it for the flesh, pursuing it into the tops of the highest gum trees, in which it passes the day feeding on the tender shoots or sleeping; it descends the trees at night in search of roots, which it digs up with its powerful claws. On the ground it creeps slowly, and when climbing looks like a small bear; when angry it assumes a fierce look and utters a shrill cry. Koalas are found in pairs, and the mother carries her young one on her back when it has outgrown her pouch; they are very tenacious of life. An account of this so called native bear may be found in the London "Philosophical Transactions" for 1808, in which, however, the koala is confounded with the wombat, another Australian marsupial. The skull is remarkable for its oblong quadrate form, great width of nasal bones, length of zygomatic arches, auditory protuberances, and depth of ramus of lower jaw.

KOOH, KARL HEINRICH EMANUEL, a German traveller and naturalist, born in Weimar in 1809. He studied the natural sciences and medicine at Würzburg and Jena, and undertook in 1836 a scientific journey through the southern provinces of Russia and the Caucasian isthmus, of which he published a narrative (2 vols., Stuttgart, 1842-'3). In a second journey in 1848-'4 he extended his researches through Turkey and Armenia to the Caspian sea, obtaining the materials for a new work, *Wanderungen im Oriente* (3 vols., Weimar, 1846-'7). On the outbreak of the eastern war, the 8d vol. was published separately under the title of *Die Krimm und Odessa* (Leipzig, 1854; translated by Korner, London, 1855).

KOCHANOWSKI, JAN, a Polish poet, born in the palatinate of Sandomir in 1582, died in Lublin in 1584. He studied in Germany, France, and Italy, and after his return to Poland was employed by King Sigismund Augustus in various missions. He soon retired, however, to private life at his country seat of Ozarnolas. His lyrical productions in both Polish and Latin, which belong to the finest of that age, gained him the appellation of the Polish Pindar. Among his writings are a translation of the Psalms in Polish verse, various satires, and a drama. The editions of his works are numerous.

KOOK, CHARLES PAUL DE, a French novelist and dramatist, born at Passy, near Paris, May 21, 1794. The son of a Dutch banker who had removed to France, and who died on the scaffold during the revolution, he was carelessly educated under his mother's supervision, and entered a banking house in the capacity of a clerk. In 1818 he printed at his own risk his first novel, *L'enfant de ma femme*, which was unsuccessful. He then produced a number of melodramas, vaudevilles, and comic operas, which brought him into notice. In the mean time he published several lively but not very decent tales and novels, which increased his popularity until he became a great favorite among the middle classes of France. His dramatic works number over 100.

KOEKKOEK, BERNARD CORNELIUS, a Dutch

landscape painter, born in Middelburg, Oct. 11, 1808, died in Nov. 1858. At the great exposition in Paris in 1855 he received a medal of the first class. For many years previous to his death he resided in Cleves, where he established a school of design.

KOEPPEN, ADOLPHUS LOUIS, a Danish lecturer and author, born in Copenhagen, Feb. 14, 1804. He was destined for a military career, but subsequently pursued a course of law studies, and in 1825 entered the royal board of commerce. In 1830-'31 he made a pedestrian tour over Europe; and in 1834, during a visit to Greece on account of his health, he received an invitation from King Otho to fill the professorship of history, archæology, and modern languages at the royal military college of the Euclides, then situated in the island of Egina. In this position he remained 9 years, visiting in the interval many parts of Greece and Asia Minor. Being obliged in 1848, in consequence of the popular rising against the German system of government, to retire from his professorship, he returned to Denmark, and in 1846 came to the United States at the invitation of the historical society of Philadelphia, before which in the succeeding year he delivered a course of lectures on "Ancient and Modern Athens and Attica," which were repeated within the next few years in an enlarged form before the Lowell institute in Boston, the Smithsonian institution in Washington, the university of Virginia, Brown university, and other institutions. In 1850-'51 he delivered a course of lectures on the political, social, and literary history of the middle ages, in illustration of which he published in 1854 his "World in the Middle Ages" (2 vols. 12mo., New York), with an "Atlas of the Middle Ages." In the same year he accepted the professorship of history, æsthetics, and modern languages in Franklin and Marshall college, Lancaster, Penn., which he still holds.

KOEPPEN, CARL FRIEDRICH, a German scholar, born in the latter part of the 18th century. For many years past he has been a teacher in the principal gymnasium of Berlin, and ranks next to the director of that institution. In 1848 he published a treatise on the rise and development of the idea of the *Jure Divino*—the divine right of kings. The impression was immediately exhausted, but the government has not allowed him to issue another edition, and has refused to raise his salary, although an increase has been granted to all his fellow instructors. In 1857 appeared his *Die Religion des Buddha und ihre Entstehung*. The various data in relation to the similarity of old and new superstitions are here brought together with great skill and scholarship into one well arranged and comprehensive work. His next important work, *Lamaische Hierarchie*, or the Lamaic system of religion as it exists in Tibet, Mongolia, and China, was published in 1859, and is regarded as a remarkable addition to that branch of study.

KOHL, JOHANN GEORG, a German traveller and author, born in Bremen, April 28, 1808. After studying law at Göttingen, Heidelberg, and Munich, and passing several years as private tutor in Courland, he travelled in Russia, and returned to Germany in 1838. His observations furnished the materials for 8 publications, which were so favorably received that he decided to devote his life to travel. He fixed his residence at Dresden, whence he made numerous excursions to England, Holland, Denmark, France, Switzerland, Dalmatia, Hungary, and other parts of Europe; and his narratives comprise 17 distinct works, most of them in 2 or 3 vols. each. He has also written some scientific treatises, as *Der Verkehr der Menschen in seiner Abhängigkeit zu der Erdoberfläche* (Dresden, 1841); *Der Rhein* (1851); *Die Donau* (1853); *Skizzen aus Natur- und Völkerleben* (1851); and a series of essays entitled *Aus meinen Hütten* (1852). He has long been collecting complete materials for a history of the voyages pertaining to the discovery of America. He pursued his researches while travelling for several years in the United States, and since his return to Germany has published two books, one on his travels in north-western America, and the other translated into English under the title of "Kitchi-Gami: Wanderings round Lake Superior" (London, 1860), and containing many of the traditions of the Ojibbeway Indians. He has also prepared a work on the history and geography of America, which has not yet appeared.—His wife, IDA KOHL, wrote in connection with him the *Englische Skizzen* (1845), and separately *Paris und die Franzosen* (1845).

KÖHNE, FREDERIC, an American merchant, of German extraction, born in Rheda, Prussia, March 30, 1757, died in Philadelphia, May 26, 1829. He emigrated in 1780 to the United States without money or resources, obtained a clerkship with a merchant in Charleston, S. C., subsequently entered into business on his own account, and at the age of 50 retired with a large fortune, passing the remainder of his life alternately in Charleston and Philadelphia. Nearly \$400,000 of his property was bequeathed to various societies connected with the Protestant Episcopal church, and to charitable institutions, and his surplus residuary estate was directed to be shared among the charitable institutions of South Carolina and Pennsylvania in such a manner that the colored population of each state might have the benefit of it.

KÓLOSEY, FERENCZ, a Hungarian author and orator, born in the county of Middle Szolnok, Transylvania, Aug. 8, 1790, died in Pesth, Aug. 24, 1838. He studied at the Protestant college of Debreczin, and, though deprived by an accident of one of his eyes, early distinguished himself by his literary attainments, became a zealous follower of Francis Kazinczy, and devoted himself especially to belles-lettres, writing for the "Transylvanian Museum." In 1809 he was appointed notary of the royal court at Pesth, and in 1826, together with his friend Paul

Szemere, started a literary periodical under the title of *Élet és irodalom* ("Life and Literature"), which owed its popularity chiefly to his own critical contributions. Having been elected 8 years later notary of the county of Szatmár, and subsequently deputy of that county to the diet of Presburg of 1832-'3, he acquired new fame by his political activity as a member of the opposition, and as an orator became one of the favorites of the nation. When Baron Nicholas Wesselényi was arraigned for treason by the Austrian government, Kólosey, prompted by friendship and patriotism, eagerly undertook his defence, but died suddenly soon after. His "Works," embracing songs, ballads, satires, short novels, critical writings, and some of his orations, were collected after his death, to which was added after the outbreak of the revolution of 1848 his "Diary during the Diet of 1832-'3." Critical acuteness, a peculiar vigor of diction in prose, and elegance in poetry, combined to elevate him to the first rank among Hungarian writers, and he ranks equally high as a patriot.

KOLLAR, JAN, a Slavic scholar and poet, born in N. W. Hungary in 1798, died in Vienna, Jan. 29, 1852. He studied at Presburg and Jena, took orders, and in 1819 became a preacher of an evangelical congregation at Pesth. Being a Slovak by birth, he became a champion of the national regeneration of his race, and the most zealous, if not the first, advocate of Pan-slavism, or of a union, literary and political, of all Slavic tribes. He developed this tendency in poetical works, written mostly in the Bohemian dialect, as well as in disquisitions on the antiquities of the Slavi. Among the former are his *Báse* ("Poems," 1821); *Slavý dcera* ("The Daughter of Glory"), his most celebrated work; and *Narodnie spievanky* (a collection of Slovakian "Popular Songs"); among the latter, *Rozprawy o imenach* ("Treatises on the Names" of the ancient Slavi); *Slawa bohyni* ("Goddess Slava"); "On the Literary Relation of the Slavic Tribes and Dialects" (in German); *Cestopis* ("A Journey" for antiquarian purposes to northern Italy); and "Ancient Slavic Italy," a work in German, which he left in manuscript. In 1849 he was made professor of archæology at the university of Vienna.

KOLLER, FRANZ, baron von, an Austrian general, born in Mönchengratz, Bohemia, Nov. 27, 1767, died in Naples, Jan. 25, 1826. He entered the army in 1785, rose gradually to the rank of lieutenant field marshal, and in 1814 was one of the commissioners who accompanied Napoleon to Elba. At one time he changed uniforms with Napoleon in order to incur himself whatever injury or insult might be offered to the latter, and kept to the end of his life the gray coat of the emperor. In 1821 he commanded an army sent to Naples to repress the revolution. He cultivated literature and art, and left a collection of antique vases obtained in Naples, which was subsequently purchased by the king of Prussia for the museum of Berlin.

KÖLLIKER, ALBRECHT, a German physiologist,

ogist, born about 1818. He is distinguished in the scientific world for his microscopic researches into the economy of the human frame, and holds the position of professor of anatomy and physiology in the university of Würzburg. Among his earlier papers are those on the reproductive organs and fluid of invertebrate animals, published in Valentine's *Reperitorium* for 1841; on the origin of the ovum in insects, and a comparison between the development of this organ in articulate animals and vertebrata (1842); on the development of the *cephalopoda* (1844); and on the contractile cells of the embryo of *planaria* (1846). In 1850-'52 appeared in two parts the first volume of an elaborate work on the "Microscopic Anatomy or Histology of the Human Body," in which were embodied the results of many years of observation with the microscope. As it was of too comprehensive a character for the use of students, he published in 1852 a complete manual on the subject, entitled *Handbuch der Gewebelehre des Menschen* (8vo., 348 woodcuts), which has been translated into English and published by the Sydenham society. By this publication he has established his rank as one of the first of living histologists. Among his more recent papers are a number on the structure of the lower animals.

KOLLONTAJ, Hugo, a Polish statesman and author, born in the palatinate of Sandomir, April 1, 1750, died in Warsaw, Feb. 28, 1812. He studied at Pinczow and Cracow, chose the ecclesiastical career, visited Rome, and after his return became canon of the cathedral of Cracow. Soon after he was appointed a member of the committee of public education organized at Warsaw by Stanislas Augustus Poniatowski, the last king of Poland. He was subsequently active in reorganizing the university of Cracow, and in 1782 was elected its rector; but he lost the office two years afterward in consequence of his reformatory tendencies, which provoked the hostility of the party friendly to the ancient rule of the Jesuits. He returned to Warsaw, and his zeal, eloquence, knowledge, and ability soon made him one of the principal actors in the grand political drama which ended with the final fall of Poland in 1794. He rose to the dignity of vice-chancellor of the crown, which he held during the deliberations of the long diet, and was in every way active in bringing about the liberal constitution of May 3, 1791. When the confederation of Targovitz, which was formed against it by the defenders of the *liberum veto* and other constitutional privileges of the nobility, became triumphant with the aid of Russian bayonets, he retired to Dresden, and his estates were confiscated. He returned to Poland in 1794 to share the dangers in the rising under Kosciuszko, and was intrusted with the direction of the finances. After the fall of Warsaw, while seeking refuge in flight, he was arrested by the Austrians, and imprisoned in Olmütz, sharing the dungeons of that fortress with Lafayette, though separated from him, but was finally re-

leased at the intercession of the emperor Alexander I. in 1803. His possessions, however, were not restored to him, and he lived in retirement in Volhynia, until the creation of the duchy of Warsaw by Napoleon, in 1807, recalled him to the scenes of his former activity. He spent his last years alternately at Warsaw and Cracow. As a patriot Kollontaj ranks among the most admired and most abused of his nation. By his adversaries he was called the Robespierre of Poland. His writings, mostly anonymous, are marked by vigor, eloquence, and sublimity of ideas. Among them are: "Letters on School Reform;" "Letters to S. N. Malachowaki, Marshal of the Diet, on the Reforms Necessary in the State;" "Remarks on the Hereditary Succession to the Throne;" "Speeches made at the Diet of Warsaw;" and "Political Law of the Polish Nation." After his death were published *Stanowienie* ("Condition of Public Education," Posen, 1842), and *Badania historyczne* ("Historical Researches," Cracow, 1844). The celebrated work on the "Formation and Fall of the Constitution of May 3, 1791," which appeared in German and French, was his only in part.

KOLOWRAT, an ancient family of Bohemia, many members of which have held high positions in church and state. Its present representative, Count FRANZ ANTON, born Jan. 31, 1778, became a member of the Austrian cabinet in 1826, and favored a comparatively liberal policy, especially after the advent of Ferdinand to the throne. Since the revolution of 1848 he has retired from public affairs. He is the founder of the national museum in Prague, and has taken an active interest in the promotion of the material and intellectual welfare of his country. The national literature of Bohemia is especially indebted to him for great encouragement.

KONG, a mountain range of W. Africa, running E. and W. nearly parallel with the coast, on the N. frontier of Upper Guinea, and terminating on the Atlantic in a number of promontories, the principal of which are Capes Verga and Sierra Leone. Its E. termination is not defined. Mr. Du Chaillu extends the name to the mountains which, connecting with those just described near the river Niger, extend southward, in a direction generally parallel to the coast of Lower Guinea, and send off several branches toward the sea. One of these ramifications extends from near Fernando Po island to the river Muni in lat. 1° 2' N., and then turning inland rejoins the main range; it is known as the Sierra del Crystal. Further inland, according to the traveller already mentioned, another offset called the Nkoomoo-Naboualee mountains runs E. and W. The Kong mountains are very imperfectly known. The W. division does not exceed 2,500 feet in average height, but in some places is believed to reach the limit of perpetual snow. Mt. Loma, on the S. W. frontier of Soodan, the supposed source of the Niger, is about 1,600 feet above the sea. Granite, marble, and limestone are the prevailing rocks.

KONIEH, KONIA, or COGNI (anc. *Iconium*), a city of Asia Minor, capital of the eyalet of Caramania, in lat.  $37^{\circ} 54' N.$ , long.  $32^{\circ} 40' E.$ , 27 m. E. by S. from Smyrna; pop. about 20,000. The stout walls which surround it were built from the ruins of the ancient city by the Seljookian sovereigns, and display some interesting Greek inscriptions and other relics, which were so arranged in the mason-work as to remain visible. Of more than 100 mosques which the city contains, 12 are large, and 2 are much admired for their magnificence. It has also several *medreses* or colleges, and the tomb of Hazret Mevlana, a Mussulman saint much revered throughout Turkey and the founder of the Mevlana dervishes. This tomb is a goal of pilgrimage for devotees; it is conspicuous by its bright green cylindrical tower and surmounted by a dome. Kouieh, however, is in a state of decay, and its houses are little more than huts of sun-dried bricks. Its only manufactures are carpets and blue and yellow leather, and its trade is inconsiderable.—The ancient Iconium, which is mentioned by Xenophon, Cicero, and Strabo, and in the history of the apostles, was the capital of Lycaonia, but rose to importance only after the taking of Nicæa by the crusaders. The Seljookian sovereigns of Roum made it their capital about the beginning of the 12th century; Frederic Barbarossa assaulted it in 1190; the sons of Genghis Khan subsequently became masters of it; and Bajazet II. made it the capital of Caramania in 1486. Ibrahim Pasha won here a decisive victory over the Turks in Dec. 1832.

KÖNIG, FRIEDRICH, a German inventor, born in Eisleben, April 17, 1775, died Jan. 17, 1833. He learned the business of a printer under Breitkopf in Leipzig, studied at the university of that city, and went in 1806 to London, where he invented an improved press. He obtained a contract for manufacturing two for the London "Times," and the machine was so successful that the number for Nov. 28, 1814, was worked by it at the rate of 1,100 impressions per hour. König afterward introduced, with the help of another German named Bauer, several improvements into this press. He also invented a machine for printing both sides of a sheet simultaneously, but this was so complicated and clumsy as to be useless. He established himself with Bauer at Oberzell, whence they sent presses to all parts of Europe.

KÖNIGSBERG, a fortified city of Prussia, capital of a government and circle of the same name, second capital of the kingdom, and formerly the capital of Prussia proper, situated on the river Pregel, 5 m. from its mouth, in lat.  $54^{\circ} 24' 8'' N.$ , long.  $20^{\circ} 30' 2'' E.$ , 850 m. by railway from Berlin; pop. in 1858, 80,000, of whom 2,500 were Roman Catholics, and 1,500 Jews. The city consists of the town proper and 4 suburbs, the former being subdivided into the Altstadt on the W., Löbenicht on the E., both lying high, and the Kneiphof, a swampy island in the Pregel. The city possesses 21 churches,

a synagogue, an exchange, a city hall, a theatre, 2 theological seminaries, 3 gymnasia, schools of all branches of fine arts, science, industry, and commerce, 6 hospitals, deaf, dumb, and blind asylums, with many other charitable institutions, and a public library of 150,000 volumes. The most imposing public building is the cathedral, an interesting Gothic structure, in which the religious service of the Reformed church was inaugurated in 1523. In a porch outside of the cathedral rest the remains of Kant, who was a native of Königsberg. The Schloss, or palace, now used for government offices, was once the residence of the grand masters of the Teutonic order, by whom the city was founded in 1257, and also of the electors of Brandenburg. The university, founded in 1544 by the margrave Albert, and hence called the Albertine university, was in a prosperous condition in the 16th century, when the attendance of students, which is now only 800, was nearly 2,000. It has a library of 50,000 volumes, including several manuscripts of Luther's, 5 clinical schools, a botanic garden, and a celebrated observatory under the direction of Bessel until his death in 1846, and containing one of the finest meridian globes in the world, prepared by Reichenbach. The first rector of the university was Georg Sabinus, the son-in-law of Melancthon. It became celebrated as the place where the philosophy of Kant was first propounded. Beside Kant, the names of Hamann, Hippel, Herder, Fichte, Herbart, and Jacobi are associated with the institution. Its 300th anniversary was celebrated in 1844, and the foundation stone for new university buildings was laid Aug. 3, 1851. The city has been strongly fortified since 1848, on the plan of detached forts, and is destined by the government to become one of the greatest fortresses of Prussia. Pillau is its port. A considerable trade is carried on, mostly with Great Britain, the exports being breadstuffs, flax, hemp, oil seeds, bones, timber, &c.; the imports, colonial produce, iron, coal, cotton, and raw sugars. Its manufactures are textile fabrics, soap, leather, and starch. Sugar and silver refining, brewing, and distilling are carried on. Much amber was formerly found, but the production has fallen off. The sturgeon fishery is of importance. The annual entrances and clearances average collectively 2,400 vessels. The shipping owned by the port in 1859 comprised 21 sailing vessels, 2 ocean and 5 river steamers.

KÖNIGSMARK, PHILIP CHRISTOPHER, count of, a Swede famous for his adventures and tragical end, born about 1640, killed July 1, 1694. While a colonel in the Swedish service he came to the court of Hanover in 1692. The prince elector (subsequently George I. of England) had married his cousin Sophia Dorothea, daughter of the duke of Zell, a princess celebrated for her beauty. Alienated from her husband by his gloomy and jealous character, Sophia was naturally attracted by the friendship of Königsmark, whom she had known when young, and gladly availed herself of his offer to aid her to

fly from the court of Hanover, where she was most unkindly treated, to France. Their interviews were watched, and one evening on quitting her he was assassinated by order of the elector. Dr. Doran, in his "Lives of the Queens of the House of Hanover" (London, 1855), endeavors to exonerate the princess from a guilty love for the gallant Swede; but the fact of its existence is established by the letters which she exchanged with him, published in Leipsic in 1847. Their love story was dramatized by Michel Masson in 1856, under the title of *Aimer et mourir*.—MARIE AURORE, sister of the preceding, born probably in Stade in 1670, died in Quedlinburg, Feb. 16, 1728. She was an orphan, and went while yet a young girl to Dresden, hoping to recover by royal intervention her property, which was kept from her by Hamburg bankers. Frederic Augustus, the elector and future king of Poland, after a long courtship, obtained her as his mistress, and by him she became mother of the celebrated Maurice of Saxony. She died in poverty, leaving 52 crowns to her son. "Her beauty, her wit, her grace, united to very remarkable acquisitions in learning and science, induced Voltaire to term her the most celebrated woman of two centuries." She left in MS. a number of dramatic pieces and poems. The memorable incidents of her life were published in Leipsic in 1836, and a full biography in 1848.

KOODOO. See ANTELOPE.

KOOM, or KUM, a Persian town, capital of a government of the same name in the province of Central Irak, 80 m. from Teheran. It is important from its situation on the high road between the N. and S. extremities of the country, merchandise destined for the south from Kasbin and northward, or such as comes from the south to any of these parts, being conveyed by the more direct road between that town and Koom instead of being carried to Teheran. Anciently it was a place of great magnificence, and had a population of 100,000; the number in modern times has been as low as 6,000. Mr. Abbot, English consul at Teheran, who visited the place in 1849 and 1850, was told by the governor of Koom that the population was gradually increasing, the number then being 12,000, not including the many strangers and temporary residents, who swell it to 20,000. Portions of the town are in ruins, it having been destroyed by the Afghans when they invaded Persia in the early part of the 18th century. The bazaars are numerous and extensive, containing about 400 shops, of which nearly 40 are appropriated chiefly to the sale of Manchester goods. There are about 20 caravansaries, and manufactures of China ware of inferior quality, of pottery, and of jars for cooling water, which are much esteemed. The town is supposed to occupy the site of the ancient Choana, and to have been built in the year of the Hegira 203, from the ruins of 7 towns, which composed a small sovereignty under an Arabio prince.

KOOR, or KUR (anc. *Cyrus*), a river of the Russian province of Georgia, which rises in the Saghanloo mountains, in the Asiatic-Turkish province of Akhalzikh, near the confines of Erzerum. It flows N. E. into Georgia until it approaches the S. base of the Caucasus, when it turns E. S. E. and runs nearly parallel with that range to the Caspian sea, which it enters by 3 mouths 100 m. S. S. W. from Bakoo. Its length is about 880 m., and it is navigable 66 m. from its mouth by small vessels. Its banks are high, and except near its mouth well wooded. Its waters are yellowish and turbid, and the current, though smooth, is rapid. Its principal affluents are the Aras, Alazan, and Yora.

KOORDISTAN, or KURDISTAN ("the country of the Koords"), an extensive region of western Asia, comprised chiefly within the basin of the Tigris, between lat. 34° and 39° N., long. 42° and 47° E., and belonging partly to Turkey, partly to Persia; area about 40,000 sq. m.; pop. estimated at 3,000,000. Its limits are not well defined. Persian Koordistan is comprised chiefly in the province of Irak-Ajeme, and the Turkish in the eyalet or province of Koordistan. The geographical features of the northern and southern portions of the country are dissimilar. Mountain ranges from 3,000 to 13,000 feet in height, and many of the peaks covered with snow during 6 months in the year, occupy the north, breaking the surface into deep, narrow valleys, and rugged table-lands, of which the most extensive is the plateau of Ali-Bagh along the Armenian frontier. With the exception of 3 ranges of hills of no great altitude, the southern portion of the territory is low and level. The principal rivers are the Tigris, Zab Ala, Zab Asfal, and Dialeh, the first receiving the waters of all the others. There are several lakes, of which the most considerable are Van and Ooroomiah. The soil is exuberantly fertile. The climate ranges from extreme heat to extreme cold; the winters in N. Koordistan are very severe, and the summers in the S. localities are attended by an equally intense heat. The country has but little mineral wealth, although alum, sulphur, and iron are found, and there are a number of salt springs. Forests of oak, walnut, and other hard woods clothe the mountains; grains of all kinds, tobacco, flax, and hemp, with the usual fruits of temperate climates, thrive on the plains. Mulberry trees, for silkworms, are cultivated. Cotton is found to succeed in certain localities. A remarkable vegetable production is found here, answering in most respects to the manna which fed the children of Israel in the wilderness; it is collected from leaves of trees and occasionally from the ground, and is dried, pounded, and eaten as a sweetmeat. The gigantic rose is a floral production peculiar to the locality. Vegetables of all kinds, especially melons and cucumbers, grow to extraordinary size. Honey is produced largely. Medicinal plants, especially gall nuts of superior quality, are largely exported, *via* Iskanderoun and Smyrna. Agriculture employs

little attention or skill. Flocks and herds constitute the wealth of the inhabitants. The horses are small, but capable of great endurance, and are much in demand for the Turkish and Persian cavalry. They are worked under the saddle only, oxen being the beasts of draught. Camels are little used, owing to the broken nature of the ground. Sheep of a long-tailed breed, with wool of the most delicate fibre, comprise the bulk of the live stock. The principal wild animals are the panther, bear, lynx, jackal, hyæna, and fox. Many varieties of game abound.—Turkish Koordistan begins on the W. side of the great mountain range which stretches from Mount Ararat in a S. S. E. direction, and now divides the Turkish and Persian empires. The province is administered by a governor-general (in 1860, Mahmoud Pasha), whose seat is at the capital, Diarbekir. During the last 20 years the Turkish government has been slowly reducing the Koords to submission, in which they have been much aided by the dissensions among the native chiefs.—The inhabitants are descendants of the ancient Carduchi (see CARDUCHI), through whose territory Xenophon led the retreat of the 10,000. Their complexion is light, and their physiognomy animated. Sharp but delicate features, an ample and open forehead, deep-set, dark, and intelligent eyes, a finely cut mouth shaded by a moustache, good teeth, small and handsomely shaped hands and feet, and a well proportioned frame, give to the Koords a remarkable elegance of person; while their active habits impart a strength of body which renders them physically one of the finest people of Asia. They are good horsemen, expert in the use of arms, adventurous and daring, inclined somewhat to brigandage, but hospitable. The young women are very beautiful, but the shrivelled look of age comes upon them when they have scarcely reached the period of mid-life. The national costume resembles that of the Turks. The men wear a cloak of black goats' hair, and a red cap around which is wound a silk shawl falling down upon the shoulders. Only the aged wear beards. The women, except a few of the highest rank, do not veil; they are treated with more respect than in most eastern countries; their principal source of amusement is music, while the diversions of the men consist almost entirely of warlike exercises and story telling. The cultivators form a totally distinct class from the warlike tribes, who look down upon them with contempt and use them brutally. The stationary part of the population live principally in small villages scattered over the hills, beside which however there are several considerable towns, the most important of which is Kermanshah. The tents of the wandering tribes are of black cloth divided into two apartments, one of which is set apart for the women. A fence of hurdles surrounds the tent, and the horses are picketed within the ring.—In religion the majority of the people profess to be Mohammedans of the sect of Omar, but their creed is tinged with remnants of

the old Manichean and Magian systems, and they have many superstitious practices not sanctioned by the Koran. About 100,000 are Nestorian Christians, locally known as Kaldani, and governed by two patriarchs, one of whom has 5 suffragan bishops and the other 18. The episcopal dignity is hereditary, descending from uncle to nephew. Bishops are often consecrated at the age of 18. The inferior clergy are generally very ignorant, although what little learning there is among the Kaldani is confined to ecclesiastics. These Christians inhabit the valley of the Tigris and the mountains which skirt it on the E. They are independent and warlike. There is a church and priest in each of their villages.—The Koords have belonged successively to the Assyrian, old Persian, Parthian, new Persian, Saracenic, and Mogul empires. They are now nominally subject to Persia and Turkey, yet pay little or no obedience to either state, and until recently nominated their own beys and pashas.

KOORILE (or KURILE) ISLANDS, a chain of small islands in the Pacific ocean, extending from the S. extremity of Kamtschatka to Yesso, the northernmost of the Japanese islands; they lie between lat. 42° and 51° N., and long. 145° and 156° E., are 25 in number, and reach over a space of more than 700 m. in length; pop. about 1,400. They are divided into the Great Kooriles, which belong to Japan, and the Little Kooriles, which are subject to Russia. The largest of the former are Kunashir, Iturup, and Urup; of the latter, Lumsu, Paramushir, and Onokotan. The surface of these islands is very irregular; in some there are mountains whose summits tower over 6,000 feet above the level of the ocean. Alexander von Humboldt in his "Cosmos" says: "The range of the Koorile islands from the extreme point of Kamtschatka to Cape Broughton (the northernmost promontory of Yesso), in a longitudinal space of 720 geographical miles, exhibits from 8 to 10 volcanoes, still for the most part in a state of ignition. The northernmost of them, on the island of Alaid, known for its great eruptions in the years 1770 and 1798, is well worthy of being accurately measured, its height being calculated at from 12,000 to 15,000 feet." The shores are in general rocky and precipitous, and, in consequence of the violent currents which prevail around them, very difficult of access. Several of the Kooriles are uninhabited, and several uninhabitable for want of water; but many are fertile, well wooded, and produce game and fish in abundance. The climate is tempestuous, severe, and foggy. The vegetable productions are few and unimportant. The principal animals are bears, wolves, foxes, saibles, otters, seals, and fowl. The chief commerce is carried on with China and Japan. The minerals are iron, sulphur, and copper. The people are in general of low stature, dark complexion, and more hairy than the other races of E. Asia. Their habits are excessively filthy, but their disposition is honest and gentle. In manners and customs the

northern islanders resemble the Kamtschadales; the southern, who are termed Ainus, to some extent, the Japanese. (See *AINUS*.)

**KOORSK**, or **KURSK**, a government of European Russia, bounded N. by Orel, E. by Voronej, S. by Pultowa and Kharkov, and W. by Tchernigov; area, 17,818 sq. m.; pop. in 1856, 1,886,949. The surface is in general undulating, the climate mild and dry, and the soil fertile. The most valuable minerals are iron, limestone, and nitre. The manufactures consist of coarse cloths, leather, soap, spirits, and earthenware.—**KOORSK**, the capital, is situated on the Tuskara, a tributary of the Sem, 280 m. S. W. from Moscow; pop. about 81,000. It is a large town, with narrow, dirty, and ill paved streets, and no remarkable buildings. It carries on a considerable trade with St. Petersburg and Moscow, and is the seat of the civil and military governors of the province, and of the archbishop of Koorsk and Bielgorod.

**KÖPPEN**, **FRIEDRICH**, a German philosopher, born in Lübeck, April 21, 1775. The son of a Protestant clergyman, he studied theology at Jena, where the lectures of Reinhold and Fichte interested him in philosophical speculations. He remained one year in Göttingen, where he wrote an *Abhandlung über Offenbarung, in Beziehung auf Kant'sche und Fichte'sche Philosophie* (1797), and afterward travelled in Switzerland. His friendship for Jacobi and sympathy with his doctrines occasioned his polemical work *Schelling's Lehre, oder das Ganze der Philosophie des absoluten Nichts* (1808). From 1804 to 1807 he was a Lutheran minister at Bremen, was afterward for 20 years professor of philosophy at Landshut, and in 1827 received the corresponding professorship at Erlangen. An earnest disciple of Jacobi, the special aim of his writings is to harmonize Christian and Platonic doctrines in philosophy. Among his principal works are: *Darstellung des Wesens der Philosophie* (1810); *Philosophie des Christenthums* (1818-'15); *Politik nach Platonischen Grundideen, mit Anwendung auf unsere Zeit* (1818); *Vertraute Briefe über Bücher und Welt* (1820-'28); and *Philosophie der Philosophie* (1840).

**KORAN**, or **ALKORAN** (the Koran, what is read, reading; from *qara*, he read, gathered), the sacred book of the Mohammedan religion, the code regulating all ethical, civil, political, criminal, and military concerns of the Moslems, and at the same time the chief literary treasure of the Arabic language. It is also honored by the following names: *D'ikr*, remembrance, admonition, praise, nobleness; *Furqân*, evident argument, distinction of good from evil, of truth from falsehood; *Al-Hudâ*, the true religion, right direction; *Kitâb (Kutub)*, scripture, book, commentary (with the epithets *Allah*, of God, *'Asis*, excellent); *Qelâm-Sherif* (*calam-us nobilis*), sacred writing; *Mushaf*, code; *Tenzil* (descended), heavenly revelation. In size it is about equal to the New Testament. It is divided into 114 *sûras* or chapters, each having a title which states its argument, or beginning

with some word contained within the argument, or with an initial letter of such word, declaring also that it was revealed either at Mecca or at Medina, and indicating the number of verses in the chapter; these peculiarities vary, however, in different editions. This introduction is followed by the formula: *Bi-sm-illahi er-rahmani er-rahimi*—"In the name of the God of pity and mercy." After these words, 29 *sûras* contain letters from which they are severally entitled; as for instance, the 50th is called *Sura Kuf*; these letters are variously interpreted according to the Jewish Cabala. The *sûras* are divided into *ayats* (signs or miracles), since each contains something wonderful, or into verses. The number of these varies from 400 to 500 in each; those at the beginning of the book are long, those toward the end are short. For the purpose of recitation in the mosques the Koran is divided into 30 *adja's* or parts, or into 60 *asads* or sections, each of 4 portions; and the whole is daily read by 30 *mogris* or readers, appointed on account of their learning.—Mohammed began his revelations at the age of 40 (A. D. 610), and continued them during 28 years amid many vicissitudes. There is, therefore, very little connection between the *sûras*, or even between the verses of each *sura*; as they were often promulgated merely by word of mouth, and recorded in the memory of his disciples, before being written down. Hence, according to the different occasions on which they were delivered, they contain dogmas, dialogues with Allah (God), narrations, praises of Allah and of Mohammed, rules of conduct for individuals and for society at large, admonitions, defences of the prophet's doctrines, promises, refutations of slanders, encouragements to the faithful, and threats, all without any systematic arrangement. The sources of these lucubrations were, beside the invention of Mohammed himself, the ancient traditions of the Arabs, the writings of the ancient Hebrews, the Talmud and Midrash of the later Jews, the Christian New Testament, together with the writings considered as apocryphal, the so-called *prot-evangelia*, and some tenets of the Magi. Many of these elements are modified in various ways; they are sometimes perverted altogether, and are especially affected by anachronisms. Details on these points may be found in the works of Geiger, *Was hat Mohammed aus dem Judenthum aufgenommen?* (Bonn, 1883), and Gerok, *Versuch einer Christologie des Koran* (Hamburg, 1889).—Concerning the mode in which the Koran was written, there are very different opinions among its votaries as well as among its adversaries. According to the former, the mission of the prophet was predicted in the Old Testament, which, they hold, was falsified by the Jews. The first *Tenzil*, written on the *Lauh* (broad table of wood or bone, shoulder blade with writing on it) *el Mahruh* (the preferred), was brought from the 7th heaven to the lowest lunar heaven, in the "night the predestined" (*leilet el qadr*), by the archangel Gabriel, the

74th and 96th suras before the others. Afterward Mohammed received portions at different times, at Mecca and subsequently at Medina. A kind of Lord's prayer, being universal, forms the *Fatihah* (exordium, opening) or first sura. The several portions were either written down, at the prophet's dictation, on skins, the shoulder blades of sheep, or on palm leaves, or were merely remembered. Gabriel is said to have pointed out their arrangement, and the collection was preserved in the ark of the doctrine. Mohammed examined the Tenzil (written on the skin of the ram which Abraham had sacrificed instead of his son Isaac, bound in silk and adorned with gold and jewels from paradise) every year, and inspected it twice in the year of his demise. Such is the belief of the faithful, who however do not agree on all the traditions. It is claimed by various sects, but not proved, that several persons assisted Mohammed in writing *Al-kitab-Allah*, viz.: Abdallah ben Selam and Verka, both rabbis; Emir ben el Hadjraim, a Greek slave; Haber and Yasir, swordsmiths at Mecca; Ayish, a bookseller; Kaish, a monk; Sergius, a Nestorian monk; Saïd ben Yanas ben Abdez-Zalibi, a Nestorian abbot at Bassorah, and a friend of Mohammed from his youth; Selman, a baptized Magus, &c. Many *as'habs* or disciples of the prophet having been slain in the battle of Yemama, Abubekr (his father-in-law and the first caliph), acting by the advice of Ali, ordered Zeid ben T'abit to collect in writing all those portions of the revelation which the surviving hearers of the prophet remembered, and intrusted the whole of the work to Haffa, one of his widows. As the divergence in the copies of the Koran caused disputes, especially between the Moslems of Syria and Irak, Othman, the 3d caliph, aided by the *as'habs*, elaborated 7 new copies at Medina, and sent 6 of them to the cities of Mecca, Yemen, Damascus, Bahrein, Bassorah, and Cufa, burned the varying copies as apocryphal, and was hence surnamed *Jami el Koran*, collector of the Koran. Later there appeared other copies varying in the reading, division and number of verses, of which two of Medina, those of Mecca, Cufa, Bassorah, and the so called *Vulgata*, are especially worthy of notice. A Koranic Masora, similar to the rabbinic, counts 6,000 or 6,236 verses, 76,639 or 99,464 words, and 823,015 or 880,113 letters in the Koran. The most renowned interpreter of the Koran was Beidhavi, who lived in the 15th century.—The dialect of the Koran, being the purest *Koraishi al-lisānu* (Koran language), ennobled the Arabian language. The system of writing, derived from the Syrian, had been adopted in the towns of Hira and Anbari, and hence by the Koreish tribe, shortly before the prophet, who called himself *Nabi Ommy*, illiterate prophet, because he learned to write late in life. The first copies of the Koran lacked diacritic signs, and hence arose various readings before Othman. Many words were differently read even during Mohammed's lifetime. There are no diacritic signs in many Cufic copies. When the Ko-

ran was diffused beyond the bounds of Arabia, it became necessary to add vowel signs. The diacritics were lines at first, written with pale black ink, and the vowels were marked in red. From the necessity of preserving the true reading among foreigners arose the Arabic grammar. The language of the Koran is peculiar in many respects; it is often abrupt, often rough, full of rare forms, has a poetic style, the last verses sometimes rhyming, is full of allusions to past and contemporary events; is highly allegorical, sometimes oracular and mystic; and contains many anacolutha, reticences, permutations, and insensible transitions, especially in the colloquies with Allah. Its graphic style is also inconsistent with strict rules, and more compendious than that used in common transactions. Superstitious veneration has opposed many improvements both in the phraseology and in the writing; hence have arisen various sects, and quarrels among interpreters and grammarians. We know of no original copy of Mecca or Medina. Soon after the conquest of Irak, Mesopotamia, and Syria, the Koran was copied at Bassorah and Cufa, so beautifully that the older copies were soon forgotten. More slender characters were brought into common use at Bagdad, and much later were introduced into the Koran by the vizier Abu-Ali Mohammed ben Ali ben Hasan Ibn-Mokla, who, although he had copied it thrice, was condemned to the loss of his right hand. His style, on being improved, became the *Neakhi* or copy-script of modern times, in which the Koran is printed.—The reading of the Koran is regarded by Mohammedans as a most pious work in itself. It must be read with great precision, and those parts and passages at which the reader must incline or prostrate himself, or perform other ceremonies, are noted on the margin. Parts of it are employed as prayers, especially the *Fatihah*. The reading of some passages is used as a specific remedy in certain diseases or misfortunes, as the *'asitun* or enchantment. The copies of the holy book are kept with the greatest veneration, and their envelope often contains the inscription: "Let none but the pure touch it."—There are probably manuscript Korans of the age of Othman and Ali at Constantinople, Damascus, and Cairo; there are some portions dating from the 1st century of the Hegira at Copenhagen. There are printed editions by Alex. Pagnini Brixiensis (Venice, 1509 or 1518, burnt by order of Clement VII.); Abr. Hinkelmann (Hamburg, 1694), the oldest now known; Mollah Usman Ismael (St. Petersburg, 1787), with valuable marginal notes; G. Flügel (Leipsic, 1835), revised by Redlob (1837 and 1842). The following are editions of the original with versions: *Muzih-i Koran*, with a Hindostanee interlinear version and notes, by Maulana Shah Abdel Kader, Calcutta, 1829-'32; with an English version, Serampore, 1833, and Persian commentaries, Calcutta, 1837. There is an English translation by Alexander Ross (London, 1649); the best is by G. Sale (2 vols., London, 1734; often reprinted).—For the teach-

ings and dogmas of the Koran, see **MOHAMMEDANISM**.

**KORDOFAN**, a country of E. Africa, subject to the sovereign of Egypt, lying between lat 12° 30' and 15° 30' N., long. 29° 20' and 31° 30' E., bounded N. and W. by Nubia and Darfoor, E. by Sennaar, and S. by the Deir or Tuggala mountains; pop. estimated at 400,000. The surface is in general level, but in the S. W. and extreme N. it is rather mountainous. There are no permanent rivers, though several small lakes exist in different parts of the country. The climate is very unhealthy in the rainy season, and in the dry season intolerably hot; hurricanes are frequent. The soil is naturally fertile. In the wet season the earth is covered with a luxuriant vegetation, but during the drought every thing is burned up. The population of Kordofan consists of negroes, Arabs, and emigrants from Dongola. This country was conquered by Mehemet Ali in 1820. Capital, Obeid, or El Obeid.

**KÖRNER, KARL THEODOR**, commonly called Theodor, a German poet, born in Dresden, Sept. 23, 1791, killed in the engagement of Rosenberg, Aug. 26, 1813. His father intended him for scientific pursuits, and sent him to the mining academy of Freiberg; but he early displayed a strong taste for poetry, and pursued his studies in the universities of Leipsic, Berlin, and Vienna. Inspired by Schiller, who was an intimate friend of his father, he published in the latter city his dramas of *Toni* and *Hedwig* and the tragedies of *Zriny* and *Rosamunda*, the latter being a beautiful dramatization of the love story of Rosamund and Henry of England. In 1810 he published his first volume of poetry under the title of *Knoepen*, or "Buds," and afterward was appointed secretary to the theatre in Vienna. The great German "war of freedom" against Napoleon inspired Körner not only to brave actions, but also to write poetry of a far better character and quality than any thing to be found in his earlier efforts. At Breslau he was enrolled among the "black hunters" of Lützow (March, 1813), with whom he entered Saxony. His great bravery soon gave him a reputation and the rank of lieutenant. He was wounded at the battle of Bautzen, but had barely recovered before he was again in action. It was during this exciting life that he wrote those patriotic songs which, accompanied by the music of Weber, have since become so well known to the world. During the night of Aug. 25, 1813, while waiting in a wood to attack a small detachment of French troops, he wrote his celebrated *Schwertlied*, or "Sword Song." At 7 o'clock on the morning of the 26th, Lützow saw and attacked the French, who took refuge in the wood while Körner pursued them. Between the fires of his own men and the enemy he was mortally wounded. His friends gathered around him, but he was speechless, and died in a few minutes. His corpse was crowned with oak leaves and buried beneath an old oak, near the village of Wöbbelin. Near the spot is now placed a

fine monument of iron, designed by the architect Thormeyer, which has become a place of great resort for visitors. A selection of his battle songs was prepared by his father and published under the title of *Leier und Schwert* (Berlin, 1814; 8th ed. 1848). His complete works were published by the direction of his mother, and edited by Streckfuss (4 vols., Berlin, 1888; 4th ed. 1858). His "Life, written by his Father, with his Selections from his Poems, Tales, and Dramas," translated from the German by G. F. Richardson, appeared in London in 1845.

**KOSCIUSKO**, a N. co. of Ind., drained by Tippecanoe river; area, 567 sq. m.; pop. in 1850, 10,243. The surface is undulating and the soil mostly productive. The face of the country is diversified with several lakes and prairies. The productions in 1850 were 341,556 bushels of Indian corn, 117,918 of wheat, 78,092 of oats, 4,888 tons of hay, and 28,540 lbs. of wool. There were 6 grist mills, 6 saw mills, 2 newspaper offices, 9 churches, and 2,451 pupils attending public schools. The Pittsburg, Fort Wayne, and Chicago railroad passes through Warsaw, the capital.

**KOSCIUSKO, MOUNT.** See **AUSTRALIA**, vol. ii. p. 375.

**KOSCIUSZKO, TADEUSZ (THADDEUS)**, a Polish patriot, born about 1755, died in Solenre, Switzerland, Oct. 16, 1817. He was descended from a noble Lithuanian family. He studied with distinction at the military academy of Warsaw, was made an officer of the corps of cadets, and was one of four selected to travel at the expense of the state. Through the friendship of Prince Adam Czartoryski, who early perceived his merit, he remained several years in France, devoted to a variety of studies. On his return to Poland he entered the army, and soon rose to the rank of captain. An unhappy and unrequited passion for the daughter of the marshal of Lithuania, one of the highest Polish officers of state, induced him to leave home, and he embarked for America to offer his sword to the patriots. Several other Poles, who had fought in the civil wars of their own country, had already crossed the ocean for the same purpose. The number of foreign auxiliary officers had become indeed somewhat oppressively great, if we may judge from Washington's complaint to congress (Oct. 1776) of the number of French gentlemen whom, from their ignorance of English, he was unable to employ. The accomplished Kosciuszko, however, received almost immediately a commission as an officer of engineers, Oct. 18, 1776, and, without having yet become personally known to the commander-in-chief, who mentions him as a "gentleman of science and merit," repaired to his post with the troops under Gates. He planned the encampment and post of the army on the range of hills called Bemis heights, from which, after two well fought actions, Burgoyne found it impossible to dislodge the Americans, and from which he retreated accordingly to Saratoga. Kosci-

nazko was subsequently the principal engineer in executing the works at West Point, and became one of the adjutants of Washington, under whom he served with distinction. From Franklin he received the most marked expressions of esteem and commendation. Finally he was honored with the public thanks of congress, and with the badge of the Cincinnati. At the end of the war he returned to Poland, where he lived several years in retirement. In 1789, when the Polish army was reorganized, he was appointed a major-general. He fought gallantly, in defence of the constitution of May 3, 1791, under Prince Poniatowski against the Russians, and particularly in the battle of Zielence (June 18, 1792), and in that of Dubienka (July 17). On the latter occasion, with but 4,000 men, he kept at bay 15,000 Russians for 6 hours. The post which he defended had been fortified in 24 hours. The patriots, however, were overwhelmed by enemies from without and by their aristocratic opponents within, who were finally joined by the weak king Stanislas Augustus himself. Russia and Prussia divided their spoils. Kosciuszko retired to Leipsic, where he received an invitation from the French government to become a citizen of France. He was bent, however, upon another effort for Poland. A rising of his countrymen was secretly planned, and Kosciuszko was unanimously elected their chief, his late commander, Prince Poniatowski, serving under him. Madalinski was the first to raise the banner of independence. Kosciuszko suddenly appeared at Cracow, March 24, 1794, issued a manifesto at once against the Russians, and, with a hastily collected host, armed mostly with scythes, advanced to meet the enemy. At Racławice (April 4) he routed with 5,000 men a Russian corps of twice that number, and returned in triumph to Cracow. Meanwhile the inhabitants of Warsaw rose against their Russian garrison, and, after a murderous conflict of 3 days, drove the survivors from the city. In various other parts the insurrection prospered with equal fortune, and the army of Kosciuszko received reinforcements from the Polish detachments which had been sent to the remote southern districts. Kosciuszko committed the conduct of government affairs to a national council organized by himself, and moved forward in quest of the imperial army. He unexpectedly found his march opposed by the king of Prussia, at the head of 40,000 men. Kosciuszko, whose force amounted to but 18,000, attacked him, June 6, 1794, at Szczekociny. From this place, after a long and bloody conflict, the Poles were compelled to fall back upon Warsaw, which during two months they held against continued and furious assaults. Cracow meanwhile was surrendered; and another Polish general lost a battle at Chelm. Disturbances arose also at Warsaw. The people murdered some disaffected Poles and a number of Russian prisoners, before Kosciuszko could interfere. He had one month before (May 29) renounced dictatorial power by the organization of a supreme national council,

into whose hands he consigned the extraordinary authority that had been conferred upon him. His power nevertheless, at least in the beleaguered city, was absolute; and in its exercise he rivalled his great American contemporary and late commander in the vigor and integrity of his conduct. The combined armies of Frederic William II. and Catharine, amounting to 50,000 men, after a succession of bloody conflicts, were compelled by the Polish chief to raise the siege. Austria came to the assistance of the baffled allies, and 150,000 enemies were now operating in the field. Against them Kosciuszko, with 20,000 regular troops and twice that number of undisciplined peasants, maintained himself until two Russian corps, under Suwaroff and Fersen, after ravaging Lithuania and defeating a Polish attack, effected a junction, and with overwhelming numbers came upon him at Maciejowice, Oct. 10. For many hours the Poles fought with unwavering fidelity. At length Kosciuszko, after repelling 3 distinct onsets, fell covered with wounds. In the act of falling from his horse, he uttered that well known prophetic lament: *Finis Poloniae*. He was taken by the Russians, and consigned to a prison in St. Petersburg. The 8d partition and entire annihilation of Poland was the consequence of the disaster at Maciejowice, which was soon followed by the storming of Praga. Kosciuszko, in his single person, had sustained the fortunes of the republic. His imprisonment was rigorously continued during two years, until the death of Catharine, when the emperor Paul, with characteristic opposition to most of his mother's personal measures, at once gave Kosciuszko his liberty, and attempted to load him with presents and marks of favor. The high-spirited Pole was resolved to accept nothing but his freedom. The czar, on releasing his prisoner, offered him his own sword. "I have no need of a sword," said Kosciuszko; "I have no country to defend." No sooner had he crossed the Russian frontier than he sent back to the czar the patent of his pension, and every testimonial of Russian favor. Henceforth his life was passed in retirement. In 1797 he visited the United States, and was received with great honor and distinction. His means were straitened; and upon Washington's explaining to him the manner in which a claim upon American bounty was to be preferred, he sought and obtained the relief which he had spurned at the hands of a Russian, congress making him a grant of land, in addition to a pension which he had received since the close of the war. Taking up his abode thereafter in France, he lived chiefly at a country place near Fontainebleau, passing his time in agricultural pursuits. In 1806 Napoleon, about to invade Poland, desired to make use of the patriot; but Kosciuszko, without a guaranty of Polish freedom, and penetrating the design of the French emperor, refused to lend himself to his purpose. When the allies approached Paris in 1814, Kosciuszko observed a Polish regiment committing

acts of pillage. Rushing forward and seeking out the officers, he upbraided them angrily for their conduct. "Who is he who dares to speak thus?" they exclaimed. "I am Kosciuszko," he replied. For 20 years his name had been heard by them but as that of a hapless exile. The effect of his appearance now was electric. Throwing down their arms, the soldiers prostrated themselves at his feet, and supplicated Kosciuszko's pardon. The emperor Alexander, who, in an audience subsequently, held him long in conversation, made him the most flattering promises. Kosciuszko repaired to Vienna, but after the battle of Waterloo he was strangely neglected, and soon left the seat of the great European congress. In 1816 he went to live in Switzerland, making his home at Soleure, whence in the following year he sent a deed of manumission to all the serfs upon his Polish estate. His death was caused by a fall from his horse over a precipice. His remains were removed by the emperor Alexander to the cathedral church of Cracow, where they repose by the side of Poniatowski and Sobieski. Near Cracow there is a mound of earth 150 feet high, which was raised to his memory by the people, supplies of earth being brought in contribution to the mass from every great battle field upon which Polish soldiers had shed their blood.

KOSEGARTEN, JOHANN GOTTFRIED LUDWIG, son of the poet Ludwig Theobul Kosegarten, a German orientalist, born at Altenkirchen, Sept. 10, 1792. He went to Paris in 1812 to study the oriental languages under Chézy and Silvestre de Sacy. On his return to Germany in 1815 he was appointed to the chair of oriental literature at Jena, which he exchanged in 1824 for the corresponding chair at Greifswalde. His principal works are an edition of the *Moallaka* of the Arabian poet Amru ben Kelthum (Jena, 1819); a German translation of the Indian poem *Nala* (Jena, 1820), and of *Tuti nameh*, a collection of Persian tales, made in collaboration with Iken (Stuttgart, 1822); an account of Aharone ben Elihu's commentary on the Caraitic Pentateuch (Jena, 1824); remarks on the Egyptian text of a papyrus in the Minutoli collection at Berlin (Greifswalde, 1824); editions of the Arabian annals of Taberi (Greifswalde, 1831), of the collection of songs entitled *Kitab al Aghani* (Greifswalde, 1840), and of Indian fables entitled *Pantehatantra* (Bonn, 1848); and some important works on the history of Pomerania.

KOSSUTH, a N. co. of Iowa, drained by a branch of Des Moines river; area, 576 sq. m.; pop. in 1859, 510. It has an undulating surface and a fertile soil. The productions in 1859 were 10,863 bushels of Indian corn, 277 of wheat, 800 of oats, 4,526 of potatoes, and 1,500 tons of hay.

KOSSUTH, LAJOS (Louis), late governor of Hungary, born in the village of Monok, county of Zemplén, April 27, 1802. His family, originally of Slavic descent, were members of the Lutheran confession and noble. His father, a

patriotic and public-spirited lawyer, gave his children a liberal education. Lajos, the only son, received his first classical instruction in the gymnasium of the Piarists at Ujhely, the capital of his native county, studied subsequently at Eperies, and finally passed through a course of legal and philosophical studies at the college of Patak. The spirit which animated this last institution has almost always been one of opposition to the rule of Austria; patriotic remembrances were attached to the place itself and its environs, once the possession of Francis Rákóczy, the leader in the last and most successful of the long struggles waged by the Hungarian patriots for civil and religious liberty in the 17th and at the beginning of the 18th century. The 8 years' strife under Rákóczy had exhausted the nation; the mild reigns of Charles VI. and his daughter Maria Theresa had lulled the spirit of independence into slumber. But the unconstitutional sway of Joseph II. had rekindled the fire of patriotism, and the wars of France carried revolutionary ideas into every quarter of Europe. When Kossuth, who had received from his parents an enthusiastic nature and liberal sentiments, reached the age of manhood, Spain, Italy, and Greece were struggling for freedom; Francis, the ruler of the empire in which Hungary was lost, was through his minister Metternich the arbiter of despotism in Europe; at no great distance from Patak, Ypsilanti, the martyr of Hellenic liberty, pined in the dungeon of Munkács, and Hegyalja, to which both Ujhely and Patak belong, was a favorite resort of patriotic Poles who were secretly preparing to throw off the triple yoke of their country. Kossuth was well read in history, and spoke with almost equal fluency the Magyar, Slovak, German, French, and Latin tongues, the last of which was still in part the legal language of his country. The institutions of Hungary were purely aristocratic, and as regards the great bulk of the people in a high degree oppressive; but in their constitutional form, in the municipal autonomy of the counties, the periodicity of the diets and municipal assemblies, the freedom and publicity of debate, and the vast numbers of the nobility, they not only possessed essential guarantees against the bureaucratic absolutism of Vienna, but also vital germs of progress and future general freedom. Jealousy of the constitutional bulwarks, and a gradual extension of the constitutional franchise, formed the programme of the Hungarian progressives, in whose spirit Kossuth made his political début, shortly after leaving college, in the assembly of his native county, of which he was appointed an assessor (*táblabíró*). He soon became noted as a liberal, exceedingly popular with the lower classes, was patronized by many of the higher nobility, but disliked by others, and was successful in the legal profession, on which he relied for his maintenance, being for some time the legal and fiscal manager of the estates of the countess Szapáry in Zemplén. During the ravages of the cholera in 1831, and the outbreak of the peasantry which accompa-

nied them in that county, he displayed a remarkable activity, which augmented his popularity. He soon after repaired to Presburg as proxy of a magnate or member of the upper house of the diet, in which capacity he had a deliberative voice, but no vote, in the lower. Having tried unsuccessfully on one occasion to secure the attention of the house, he subsequently shared the silence of his fellow proxies, but his pen was actively and more effectively employed. The diet of 1832-'6, which in several ways ameliorated the condition of the peasantry, ranks among the more important assemblies of modern Hungary. Its debates, closely following the Polish tragedy of 1831, were watched with lively anxiety by the patriots, but their publicity was hindered by severe restrictions on the press. The opposition, at the suggestion of Kossuth, resorted to the extraordinary means of a written newspaper for the information of their constituents and the public at large, and intrusted him with the laborious task, which he performed with equal ardor, skill, and perseverance. The *Országgyűlési tudósításkönyv* ("Parliamentary Communications"), extracts and comments, were dictated by him to a large number of copyists, and widely circulated in spite of the obstacles thrown in the way by the post office. The opposition party and its organ gained alike in popularity by this not always impartial diffusion of liberal ideas throughout the country. After the close of the diet, Kossuth endeavored to continue his activity by a lithographic paper, *Törvényhatósági tudósításkönyv* ("Municipal Communications"), edited in Pesth, and destined to form a central organ and bond of union of the opposition in the county assemblies. The government, now freed from the jealous watchfulness of the diet, prohibited its publication. Kossuth, who received the prohibition in an unconstitutional way, resisted, putting himself under the protection of the county of Pesth. The government sent its prohibition to the latter. The assembly refused to obey, declaring all censorship unconstitutional, and its exercise a usurpation. Numerous other counties supported Kossuth with equal zeal. The government now resorted to open violence, and caused the young journalist with several other advocates of the popular cause, among them the fiery Transylvanian agitator Baron Nicholas Wesselényi, to be arrested by the soldiery. Kossuth was seized in the night at his summer residence in the mountains of Buda (May 2, 1837), tried, and finally condemned for treason to 4 years' imprisonment. A general outburst of indignation and an unprecedented agitation followed these acts. The liberals carried the elections for the diet of 1839-'40, and answered the government propositions, the principal of which were demands for subsidies in money and men, with a demand for the liberation of the prisoners. The Thiers ministry in France threatening a general movement in Europe, which was then agitated by the Egyptian question, the cabinet of Vienna was compelled to yield. One of the

prisoners, Lovassy, was mad; Wesselényi left his prison blind; Kossuth left that of Buda enfeebled in body, but with a mind enriched by earnest meditation on political questions. His liberation was hailed with loud demonstrations, but he had lost his father. In the house of his mother he made the acquaintance of Theresa Meszlényi, an accomplished young lady whom he afterward married, while her brother married his sister Susanna. The laws of 1840, enacted under the leadership in the house of deputies of Francis Deák of Zala, gave new vigor to the opposition; its tendencies became broader, its supporters more numerous. It was at this juncture that Landerer, a publisher of Pesth, having received from the government a license for the publication of a semi-weekly journal with the right of choosing its editor, invited Kossuth to assume its direction. The *Pesti Hírlap* ("Pesth Journal") started Jan. 1, 1841, with fewer than 100 subscribers, but in a month they were numbered by thousands. Reform after reform was proposed, every abuse in institutions, laws, and practice was scrutinized and denounced, every question of general interest discussed. The national, moral, and material regeneration of the people, of the whole people, was the avowed aim; the existing constitution was to serve as a means; the aristocracy to have the lead. Turning to the latter in his programme, Kossuth exclaimed: "With you, if you choose; without you or against you, if it must be." The ability with which he managed to break his way through the difficulties created by Metternich's censors of the press was admirable. Not only the government and the conservatives of the higher nobility were alarmed; Count Stephen Széchenyi himself, a renowned patriot and moderate champion of reform, was the first to appear in the lists against the innovator, who ventured so far beyond the former programme of the opposition. In a book entitled *Kelet népe* ("People of the East"), he denounced him as a dangerous agrarian and demagogue. An admirer of the English constitution, Széchenyi was ready to bestow freedom on the people as a gift; Kossuth demanded it as a right, and threatened to extort it. Material progress and practical calculation were foremost in the views of the former, liberty and enthusiasm in those of the latter. Kossuth replied to Széchenyi in a *Felvetel* ("Answer"). Baron Eötvös declared in his favor in the pamphlet *Pesti hírlap és Kelet népe*. The conservatives found an able advocate in Count Aurel Dessewffy, who began an acrimonious warfare against the agitator in the columns of the *Világ* ("Light"), which was continued after his death by his brother Count Emil Dessewffy in that paper, and subsequently in the *Budapesti híradó* ("Buda-Pesth Intelligence"). Public opinion was decidedly in favor of Kossuth, and the *Pesti hírlap* not only became the regular organ of the opposition, which again carried the elections in 1843, but also the oracle of the younger portion of the nation. The diet of 1843-'4,

though deprived of the leading and organizing talents of Deák, had in Count Louis Batthyányi and Baron Eötvös, the leaders of the upper house, in Klauzál, Beöthy, Szentkirályi, Palóczy, Szemere, Bezerédy, Pázmándy, Ghyczy, and others, a number of bold and eloquent advocates of popular rights; and the whole tenor of the debates, though the conservatism of the majority of the house of magnates prevented much from being done, impelled the government to a series of new reactionary efforts. The autonomy of the counties was assailed. A difficulty with the publisher, which was not believed to be accidental, removed Kossuth from the editorship of the *Pesti hírlap*, which was transferred to Szalay (July 1, 1844). Kossuth received no license for another journal, and as the new editor of his former organ belonged to a branch of the opposition, the friends of centralization under the lead of Eötvös, to which he was most heartily opposed, he found no better medium for the occasional publication of his views than the *Hetilap* ("Weekly Paper"), a small industrial sheet. He was, however, far from yielding an easy triumph to the government. Not satisfied with the influence he exercised by his eloquence in the quarterly assemblies of the county of Pesth, which played a leading part in the debates of the nation, he sought a new arena for agitation in the yet unrestricted sphere of association. Hungary, separated from the other provinces of the Austrian empire by watchfully guarded barriers, was exhausted by a tariff calculated to keep it for ever in a state of colonial dependence on the German provinces, which, on their part, were protected by another tariff in their industrial developments against the competition of England, France, or Belgium. This system formed one of the chief grievances of the nation, and the orators of the diet of 1843-4 had in vain exhausted all the powers of their oratory in denouncing it. Assisted by the most influential members of the opposition, among others by Counts Louis and Casimir Batthyányi, Kossuth now founded the *Védegylet* (protective union), an association whose members, men and women, bound themselves for 5 years to use exclusively home-made productions, whenever these could be had. Other societies, agricultural, commercial, and industrial, were practically to assist the protective union. The latter soon counted their members by hundreds of thousands, affiliated in all parts of the country. Kossuth was the animating spirit of the whole organization, which for various reasons, originating in part in the industrial condition of the country, and in part in the character of the people, proved less effective for its direct purpose, the development of home industry, than for the no less important end of keeping alive the national agitation. Most of the practical projects failed, among others that of constructing a railroad from the lower Danube to the Adriatic at Fiume, as a national channel for the exportation of Hungarian products, and for a direct communication with England.

After some time the protective union languished, and even the personal popularity of Kossuth seemed to be on the decrease, when the elections of 1847, coinciding with the movements in Switzerland, Italy, and elsewhere, precursory to the revolutions of the following year, gave a new turn to affairs. Kossuth appeared with Szentkirályi as a candidate for the county of Pesth. The efforts of the government party to prevent his election were immense, but fruitless; the influence of the Batthyányis and their friends prevailed. The programme of the opposition at the opening of the diet was bolder and more distinctly democratic than before. In order personally to combat his eloquent antagonist, Count Széchenyi, although entitled by his rank to a seat in the upper house, had himself elected to the lower for Wieselburg. A few sessions sufficed to establish Kossuth as a recognized leader of the house; his eloquence, surpassing knowledge of the history and statistics of his own and other countries, untiring energy, and perfect mastery of every question, made him irresistible. His attitude toward the government was now one of open hostility. The uncompromising opposition between the two parties seemed to condemn the diet to inaction, when the news of the Paris revolution of Feb. 1848 reached Presburg. Kossuth hesitated not a moment to take advantage of the state of affairs. The time of compromises between the rule of Metternich and the constitutionalism of Hungary was gone. In a speech delivered on March 8, he proposed an address to the king (the emperor Ferdinand), urging the restoration of Hungary to its former independence as a state, and the granting of a charter of liberty for the whole Austrian empire. The house of deputies accepted the propositions almost unanimously; the upper house wavered, but the people of Vienna, taking the matter into their own hands, decided the question on March 18. Metternich fled. Kossuth was received in the capital of the empire, whither he now carried his address, with the honors of a liberator, and Louis Batthyányi was intrusted by Ferdinand with the formation of an independent Hungarian ministry. Simultaneously Pesth had its day of revolution, March 15. Kossuth received the department of finance in the new ministry, which embraced the most distinguished representatives of the opposition movement since 1825, Széchenyi, the late adversary of Kossuth, Deák, Klauzál, Eötvös, and Szemere. The long urged measures of liberal reform were now carried in an amplified shape, and when on April 11, 1848, the last diet of Presburg closed its sessions, to make room for a national assembly in Pesth, the noble members might have boasted of having agitated and carried through the abolition of their own most essential prerogatives, and prepared for the advent of democracy. This great revolution was thus executed by peaceful and legal means; but a bloody conflict was to follow. Kossuth well knew it, and though anxious to avert it, made

ready for every emergency. Losing little time in enjoying the honors of his triumph, he devoted all his energies, as the leading spirit of the new government, to the organization and consolidation of its powers. The difficulties were enormous. The Hungarian troops were abroad, and foreigners under foreign officers garrisoned the fortresses and principal cities. The Slavic population of the south of Hungary, long agitated by Pan-Slavic tendencies fostered by Russia, and still more by the tools of the cabinet at Vienna, rose in insurrection against the new order of things. The new ban of Croatia, Jellachich, took arms ostensibly for the independence of his province, but in reality for the restoration of absolutism. The Wallachs and Saxons in Transylvania, which was to be reunited with Hungary, joined the reactionary movement. The "camarilla" of Vienna, and afterward of Innspruck, was soon reassured and emboldened by successes in Galicia, Prague, and Italy. The Hungarian treasury was empty; ammunition, arms, and military experience were wanting; few officers of rank could be trusted; the Magyars of the north had not heard the sound of cannon since the times of Rákóczy, those of the south since the wars of Eugene. Kossuth created a treasury, organized the militia, formed new battalions of national soldiery (*honvéds*), established armories, and roused the spirit of the nation by proclamations, speeches, and articles in his new organ, *Kossuth hírlapja* (edited by Bajza), though at the same time neglecting no means of bringing about a peaceful solution of the difficulties. His speech to the diet at Pesth, July 11, in which he demanded the granting of 200,000 men and 42,000,000 florins for the defence of the country, was a masterpiece of eloquence. A small radical opposition had already formed itself, but its spokesman Nyáry was the first to rise with the solemn declaration: "We grant it." The king, however, refused his sanction. The south of Hungary and Transylvania were already bleeding in an internecine struggle of races, in which the Rascians, old enemies of the Magyars, were particularly conspicuous. All Batthyányi's endeavors and a deputation of the diet, consisting of 120 members, to the court of Vienna, were of no avail. Reaction was triumphant everywhere, the camarilla was flushed by the victories of Radetzky, and Jellachich crossed the Drave with a large army to subdue Hungary. Batthyányi resigned; the palatine Stephen was in vain invoked to mediate, and finally fled; Jellachich was approaching the capital. Kossuth in the meantime had begun his armaments and issued treasury notes without the sanction of the king, and, in a proclamation full of oriental fire, he called upon the people to rise and vindicate their rights, threatening them with the contempt of the nations in case of cowardly submission. He repaired to the people of the Theiss, who flocked around his banners, and on his return entered upon a new course of activity, as head of the "committee of defence."

The war of revolution was thus begun. (See HUNGARY.) It was from beginning to end a struggle for life or death under inauspicious circumstances. The Magyars and their kindred the Szeklers of Transylvania, supported by the German and Jewish population and a part of the Slovaks and Ruthenians, as well as by volunteers from Poland, Vienna, the Tyrol, and Italy, fought with exalted enthusiasm against the regular forces of Austria, against Croats, Slavonians, Rascians, military borderers, Serbs from Turkey, Wallachs, Saxons, and Cecho-Slovakish volunteers, and finally against the armies of Russia. Several of the fortresses of the country, Temesvár, Arad, Carlsburg, &c., were in the hands of the enemy; communication with foreign countries was impossible; the way for invasion was open on every side; hesitation, wavering, and dissensions were almost unavoidable. Still, after many defeats, valor and enthusiasm triumphed for a time over discipline and the difficulties of the situation, and the world abroad saw with astonishment bands of volunteers and raw levies transformed into victorious armies; fortresses taken by assault; a province of Austria converted into an independent state; a journalist placed at the head of a nation, once renowned for loyalty, as responsible "governing president;" and the fields of the Theiss becoming the scene of a final decision between absolutism and democracy in Europe. The overwhelming power of Russia, the obstinate disobedience of one of the revolutionary commanders, the want of arms, and the indifference of the governments of Europe, or rather their connivance with Russia and Austria, finally decided against Hungary and Kossuth, its moral dictator. It is hard to determine whether he could have averted the catastrophe by a timely removal of Görgey. Certain it is that such a step would have been at any time dangerous. The victorious general was the favorite of his army and the choice of his officers. He generally operated independently, and the services of his army could at no moment be spared, the state of affairs being continually one of imminent peril. To dismiss him was impossible; to arrest and imprison him would have provoked mutinies for his release; to have him tried and executed for what could hardly be called treason would have been regarded as a murder committed for the removal of a rival, guilty only of having acquired too much glory in the service of the country. That Kossuth was on many occasions too scrupulous in guarding his reputation has since, and perhaps not without reason, often been asserted. But it was also this unstained reputation of the revolutionary dictatorship which formed one of the principal sources of its successes. It inspired the people with confidence, the diet with unanimity, the non-Magyars with love for the national leaders. Never had a revolution in Europe been carried on with so little internal strife, amid so much personal freedom, with such order and legality. The bitterest former assailants of Kossuth, Des-

sewffy, I. Nagy, and others, lived unharmed; those who afterward became his assailants, as Szemere and Ocsimír Batthyányi, acted in harmony with him to the last moment of the revolution; generals of independent will and character, as Perczel and others, except Görgey, obeyed, though reluctantly. On Aug. 11, 1849, Kossuth transferred his powers to Görgey, who two days later surrendered to the Russians. Kossuth, like Tökölyi and Rákóczy, the leaders of the Hungarian patriots in similar movements of former centuries, sought refuge in Turkey. This state was certainly not ill disposed toward the refugees, with whom it shared the hatred of Russia, but fear of that empire led it to an apparently unfriendly course. Kossuth and his followers were confined in Widin, Shumla, and subsequently in Kutaieh in Asia Minor. His extradition was demanded by Austria and Russia, but though he refused with scorn the proposed means of evading all danger by an adoption of the Mohammedan religion, the Porte, true to the principle of hospitality, so sacred to Moslems, and encouraged by England and France, resisted all threats; and finally, at the intervention of the United States and England, he was allowed to depart with his family and friends. His wife had secretly escaped from Hungary, and his 3 children, 2 sons and a daughter, had also been allowed by Haynau to join him in Asia. On Sept. 1, 1851, he was liberated and set out to embark on the war steamer Mississippi, Capt. Long, which had been despatched by the United States government, in accordance with a resolution of the senate, to convey him to America as the nation's guest. The Mississippi touched at the ports of Smyrna, Spezia in Italy, and Marseilles. He was received with lively demonstrations of sympathy by the population, but the governments of both Sardinia and France refused to allow him a passage through their territory to England. In Marseilles he published a stirring address in French to the people. Worn out by cares and grief at the fall of his country and the death of its most zealous defenders, he was yet unbroken in spirit, and he had employed the days of his confinement in Asia not only in the study of military science, but also in perfecting his knowledge of living languages. He was able to address the people of the West in French, English, German, and Italian. Preparatory to pleading the cause of his country before the people of Great Britain and the United States, he had made English his special study; and when, after visiting Gibraltar and Lisbon, where he was treated with distinction, he finally reached Southampton, he was listened to with no less admiration than sympathy by the English. The same enthusiastic feeling followed him on his tour through the most populous cities of the kingdom, and subsequently through the United States, where he arrived Dec. 5, 1851, accompanied by his wife and Mr. and Mrs. Pulszky. He addressed numberless deputations and meetings in New York, Philadelphia, Baltimore, Washington, Annapolis, Pittsburg, Cleveland, Co-

lumbus, Cincinnati, Indianapolis, Louisville, St. Louis, Jackson, Mobile, New Haven, Springfield, Worcester, Boston, Salem, Albany, Buffalo, Syracuse, Utica, and numerous other places, urging the acknowledgment of the claims of Hungary to independence, and the interference of the United States jointly with England in behalf of the principle of non-intervention, which would allow the nations of Europe fair play in a new struggle for liberty. His agitation received a fatal blow by the *coup d'état* of Louis Napoleon, the news of which arrived about a fortnight after his landing, almost entirely destroying the hope for a speedy regeneration of Europe. His call for effective aid in contributions for a reopening of the struggle in Hungary had therefore a very small result, in spite of the general sympathy with the exile and his cause. At the seat of the federal government he was received with distinctions which had never been bestowed on any foreigner except Lafayette. At a banquet given him by the members of both houses of congress, and at which he was addressed among others by Daniel Webster and Gen. Cass, he began his speech with the following words: "Sir: as once Cincinnatus the Epirote stood among the senators of Rome, who with a word of self-conscious majesty arrested kings in their ambitious march, thus, full of admiration and of reverence, I stand among you, legislators of the new capitol, that glorious hall of your people's collective majesty. The capitol of old yet stands, but the spirit has departed from it, and is come over to yours, purified by the air of liberty. The old stands, a mournful monument of the fragility of human things; yours as a sanctuary of eternal right. The old beamed with the red lustre of conquest, now darkened by the gloom of oppression; yours is bright with freedom. The old absorbed the world into its own centralized glory; yours protects your own nation from being absorbed, even by itself. The old was awful with unrestricted power; yours is glorious by having restricted it. At the view of the old, nations trembled; at the view of yours, humanity hopes. To the old, misfortune was introduced with fettered hands to kneel at triumphant conquerors' feet; to yours the triumph of introduction is granted to unfortunate exiles who are invited to the honor of a seat. And where kings and Cæsars never will be hailed for their power and wealth, there the persecuted chief of a down-trodden nation is welcomed as your great republic's guest, precisely because he is persecuted, helpless, and poor. In the old, the terrible *ex victis*! was the rule; in yours, protection to the oppressed, malediction to ambitious oppressors, and consolation to a vanquished just cause. And while from the old a conquered world was ruled, you in yours provide for the common federative interests of a territory larger than that old conquered world. There sat men boasting that their will was sovereign of the earth; here sit men whose glory is to acknowledge 'the laws of nature and nature's God,' and to do what their sovereign, the people,

wills." With honors and distinction, however, he received not a little criticism and reproach, which also pursued him through his subsequent course in Europe, where he returned in July, 1852, and where he for some time acted in concert with Mazzini and Ledru-Rollin, forming with them a kind of revolutionary triumvirate. Preparations for a rising in the spring of 1853, which rapidly consumed the contributions received in the United States, ended with the execution of Jubal, Noszlopi, and others in Hungary, and with the banishment of Kossuth's patriotic mother and sisters. His mother died soon after in Brussels; one of his sisters, Mme. Meszlényi, died some time after her arrival in the United States, where the other two, Mme. Zulyavsky and Mme. Ruttkay, still reside. The outbreak of Milan (Feb. 1853, during which an old proclamation of Kossuth's was used by the friends of Mazzini, led to a misunderstanding with the latter, and to an investigation by the English government of the doings of the political refugees, which however proved nothing against Kossuth. The hopes inspired by the war against Russia also proved delusive. Kossuth's published remarks on the false strategical course pursued in that war by the allies were but too well justified by the development of events. After some participation in newspaper discussions, he finally resumed his activity as a public speaker, delivering lectures on various topics of European interest, but especially on the history and affairs of Hungary, in various cities of England and Scotland, on the proceeds of which he has since relied for the maintenance of his family. The preparations of Napoleon and Victor Emanuel for a war against Austria at the beginning of 1859 once more rekindled his hope for the liberation of Hungary; and the speech for the neutrality of England in the war, which he was called upon to deliver by the friends of Italy in London, and the marked influence which it exercised, proved the unabated vigor of his faculties. He soon after repaired to Paris, and subsequently to Italy, where he was received with great enthusiasm by the people, and introduced by Prince Napoleon to the emperor of the French, with whom he concerted a common plan of attacking Austria in its Hungarian possessions in case the war should be carried into the interior of Venetia. This, however, was prevented by the peace of Villafranca; Kossuth, bitterly disappointed, returned to England, and the Hungarian legion, formed under Klapka in Sardinia, was dissolved.—Various collections of more or less complete speeches by Kossuth have been published in England, the United States, and Germany. Sketches of his life and career are still more numerous, but there is hardly any which can pretend to the importance of a historical biography.

**KOSTROMA**, a government of European Russia, between lat. 56° and 60° N., and long. 40° and 45° E., bounded N. by Vologda, E. by

Viatka, S. by Nijni Novgorod and Vladimir, and W. by Jaroslavl; area about 80,000 sq. m.; pop. about 1,000,000, almost all Russians. It is traversed by the Volga, which here receives the Kostroma and other rivers. It consists of wide plains, little varied by gentle acclivities or river banks. The northern part is comparatively swampy and cold. Extensive woods abound. The soil is generally fertile. Agriculture, the rearing of cattle and sheep, hunting, and fishing are the chief pursuits of the inhabitants. Cloth, leather, and iron are manufactured to some extent. Capital, Kostroma on the Volga, one of the more interesting cities of eastern Russia, with a population of about 15,000.

**KOTAH**, a native state of Hindostan in Rajpootana, lying between lat. 24° 30' and 25° 50' N., and long. 75° 35' and 76° 56' E., bounded N. E. and E. by Jhallowa, Gwalior, and Chupra, N. W. and W. by the Chumbul and a part of Gwalior, and S. by an isolated portion of Holkar's territory and Jhallowa; area about 4,889 sq. m.; pop. 488,000. The surface is, for the most part, an inclined plane, sloping gently northward from the high table-land of Malwah. The soil is generally fertile and well cultivated, but the climate is very unfavorable, being intensely hot during the prevalence of the warm winds of summer, and extremely unhealthy during the rainy season. The rajah of Kotah is in subsidiary alliance with the British, and maintains a contingent of about 700 men, commanded by British officers. These troops rose against the British, July 4, 1857, and two regiments of the rajah's native army did the same on Oct. 15. The rajah kept faith with his allies.

**KÖTHEN**. See **ANHALT**.

**KOTZEBUE**, AUGUST FRIEDRICH FERDINAND VON, a German dramatist, born in Weimar, May 8, 1761, assassinated in Mannheim, March 28, 1819. He studied at the gymnasium of Weimar and the university of Jena. He intended to become a lawyer, but availed himself of every opportunity to acquire a knowledge of theatrical matters, and published some prose writings as early as 1791. The patronage of the Prussian ambassador secured for him employment as secretary of the governor-general of St. Petersburg, who on his death commended him to the favor of the empress. In 1785, after his marriage with a daughter of Lieut. Gen. Von Essen, he was appointed to a high judicial office in the province of Esthonia, and was ennobled, which afterward led him to write a fulsome work on nobility. His literary reputation was established by several successful novels and dramas, but injured by the publication of *Doctor Bahrdt mit der Eisernen Stirn* ("Dr. Bahrdt with the Brazen Face"), in which he attacked the celebrated poets of Weimar (Goethe, Schiller, &c.), who had declined to admit him into their society. After the death of his wife he visited Paris, on which occasion he wrote another ill-mannered book (*Meine Flucht nach Paris*, 1790). After his return to Russia, he devoted several years to writing a series of

plays until 1798, when he succeeded Alxinger as poet laureate of the imperial court and theatre at Vienna. In 1800 he retired from that position with a pension of \$500. After a temporary residence at Weimar he returned to Russia, where his children were educated in the military academy of St. Petersburg; but he was arrested on the frontier of Courland on suspicion of having written pamphlets against the emperor Paul, and banished to Siberia. He published a rather romantic description of the year which he spent in exile (*Das merkwürdigste Jahr meines Lebens*, 8d ed. 1808; French and English translations, 1802), and was indebted for his liberation to one of his plays (*Der Leibkutscher Peters des Grossen*), which had been translated into Russian, and given so much satisfaction to the emperor, who was indirectly represented in it in a flattering light, that he was not only recalled, but presented with an estate in Livonia and made director of the German theatre in St. Petersburg and imperial councillor. After the emperor's death he returned to Weimar, and subsequently went to Jena, but his malignant conduct toward Goethe compelled him to leave both cities. He took up his abode in Berlin, where he became a member of the academy of sciences, and one of the editors of a literary journal (*Der Freimüthige*), in which he continued his warfare against the most eminent literary men of Germany. Between 1803 and 1806 he published an entertaining but superficial account of his travels in Livonia, France, and Italy; and in 1808-'9 appeared his "History of Prussia" (*Preussens ältere Geschichte*), esteemed only for its collection of authentic historical documents. After the battle of Jena he fled to Russia on account of his violent animosity against the French, which he continued to display from 1808 to 1812 in the columns of various literary journals. He was made councillor of state, and in 1814 Russian consul-general for Prussia in Königsberg. In 1816 he received an appointment in the ministry of foreign affairs in St. Petersburg, and in 1817 the emperor Alexander engaged him at a considerable annual salary to report on the state of public opinion in Germany. He resided alternately at Weimar and Mannheim, and at the same time conducted a weekly journal. The little respect entertained for him by the best minds of Germany grew still less from his unscrupulous attacks on the advocates of free institutions. He was denounced as a mercenary tool of despotism, and when it became known that he was the author of letters to the czar, and of articles, in which the secret political associations of the German students (*Burschenschaften*) were held up to the scorn and ridicule of the world, a young and enthusiastic student named Sand repaired to Mannheim and made his appearance in Kotzebue's residence on the morning of March 28. The author was not at home, but returned in the afternoon, when the youth called again, and, after exchanging a few words, stabbed him in the breast with a dagger,

exclaiming: "This is for you, traitor to your country."—Kotzebue was the most fertile and successful writer of plays whom Germany ever produced. Many of them have been translated into English, French, and other foreign languages. Among those best known on the American and English stage are the "Stranger" and "Pizarro," both adapted by Sheridan, the former from Kotzebue's *Menschenhass und Reue* ("Misanthropy and Repentance"), and the latter from his *Incas in Peru*. The number of his serious plays was about 100, but they have almost disappeared from the stage. His comedies and farces exceeded that number, and some of the most humorous of them retain their popularity. Complete editions of his dramatic works appeared in Leipsic in 1797-1823, in 28 vols., and in 1827-'9, in 44 vols. His most successful novel is one written in his early life ("Sorrow of the Ortenberg Family," French translation, Paris, 1801). His posthumous writings were published in Leipsic in 1821. An English translation of his autobiography appeared in London in 1800. His German biographers are Cramer (Leipsic, 1819) and Döring (Weimar, 1829).—Otto von, son of the preceding, a Russian traveller, born in Revel, Dec. 19, 1787, died there, Feb. 13, 1846. He was educated at the academy of St. Petersburg, and joined Krusenstern as midshipman in a voyage round the world, from which he returned in 1806. He was promoted to the rank of lieutenant, and intrusted in 1815 with the command of the Rurik, a vessel equipped at the expense of Count Rumiantzoff. He was joined in this expedition by the poet Chamisso, and by the naturalists Eschscholtz and Choris. After the discovery of various islands, bays, and a sound N. E. of Behring's strait, since called after him, he returned to Russia, Aug. 8, 1818, and published an account of his journey, which has been translated into French and English ("A Voyage of Discovery into the South Sea and Behring's Strait in the Years 1816-'18," 8 vols. 8vo., London, 1821). In 1823 he undertook a third voyage as captain of an imperial man-of-war, and was again accompanied by Eschscholtz and other savants, also by the sons of the Russian minister of marine, Möller, and of Krusenstern. Touching at Rio de Janeiro, he doubled Cape Horn, discovered several islands, collected much valuable information on ethnography, natural history, and geography, visited New California and the Sandwich islands, and on his way home touched at the Philippine islands, reaching Cronstadt July 10, 1826. In 1829 he retired from active service, and spent the rest of his life with his family in Esthonia. His explorations have advanced considerably the knowledge of hydrography, especially that of the South sea. He published a narrative of his voyage, of which an English translation appeared in London in 1830 ("A New Voyage round the World in the Years 1823-6"). The romantic character of the narrative led several critics to impugn its veracity, although there is no evidence by which

the charge can be supported. Eschscholtz enriched the volume with full zoological information.—MORITZ, brother of the preceding, born April 30, 1789, sailed with Krusenstern round the world, entered the Russian army in 1806, was captured by the French in 1812, liberated in 1814, and published in 1815 an account of his adventures (*Der Russische Kriegsgefangene unter den Franzosen*). Attached to the Russian embassy, he made a journey to Persia in 1819, of which his father published a description in Weimar in 1819 (English translation, "Narrative of a Journey into Persia in 1817," London, 1819).—The eldest brother, WILHELM, born in 1785, served in the Austrian army, afterward in that of Russia, and was lieutenant-colonel when he died in 1812 from wounds received at the battle of Polotzk.

KOULI KHAN. See NADIR SHAH.

KOUMAS, CONSTANTINE MICHEL, a modern Greek scholar and author, born in Larissa in Thessaly about 1775, died in Trieste, May 18, 1836. He studied at the college of Tournovo, and travelled in Germany, where he became intimate with Wieland, Wolf, and others, who encouraged him in his desire to promote literature and education in Greece. For several years after returning to his native country he labored diligently to this end. In 1821, when the revolution broke out, he escaped from the Turks and fled to Trieste, where he was appointed to the directorship of the Greek gymnasium. He published several works on grammar and history, the principal being his great Greek dictionary (Vienna, 1836).

KOUMISS, an alcoholic liquor distilled by the Calmuck Tartars from mares' milk as it is undergoing fermentation. It is stated that 21 oz. of milk yield 14 oz. of low wines, from which 6 oz. of pretty strong alcohol are obtained by rectification. Cows' milk, probably from its containing less saccharine matter, yields much less spirit.

KOZLOFF, IVAN, a Russian poet, born in 1774, died in 1838. An accomplished man of the world, at the age of 29 he lost the use of his legs by paralysis, and not long after became totally blind. The cultivation of literature and the study of the modern languages thenceforth afforded him the chief alleviation of his misfortunes. To the English language he gave particular attention, and in a short time was able to speak and write it. Pushkin's "Fountain of Bakhisserei" was translated by him into English with as much correctness as if done by an Englishman. He translated into Russian many of the choicest minor poems of the English language, and long extracts from "Childe Harold" and "Don Juan." Byron seems to have been his model as a poet, and two of his most important narrative poems, the "Monk" and the "Princess Dolgoruki," are in the style of the "Gisour." His poems have been collected in 2 vols.

KOZMIAN, KAJETAN, a Polish poet, born in the latter part of the 18th century, died near

Lublin, March 7, 1856. He wrote the biographies of Kosciuszko and other eminent men, and translated Horace, the *Bucolics* of Virgil, and other classic authors. His lyrics have found many admirers. His last work, not yet published, is an epic poem, "Ozarniecki."

KRAITSIR, CHARLES, a Hungarian physician and philologist, born in Szomolnok (Germ. Schmöllnitz), county of Zips, Jan. 28, 1804, died at Morrisania, Westchester co., N. Y., May 7, 1860. He received his first education at Rosenau and Kaschan, and afterward studied medicine and various branches of science at the university of Pesth, where he was graduated as M.D. in 1828. In the beginning of 1831 he went to Poland, where he took an active part in the revolution; and joining the Polish army in the capacity of physician, he subsequently accompanied it through Germany to France, where he became a member of the Polish emigration committee. He came to the United States in 1833, with a view of promoting the welfare of the Poles by founding a Polish colony. A narrative of his efforts is contained in his work entitled "The Poles in the United States," the 1st volume of which was published in Philadelphia in 1836-'7. In 1837-'8 he established an academy at Ellicott's Mills, near Baltimore; afterward resided for some time in Washington city; officiated in 1840-'41 as principal of the state academy of Maryland at Charlotte's Hall, and from 1842 to 1844 as professor of modern languages and history in the university of Virginia. Next he went to Boston, where he delivered lectures on philology and established a school. In 1846 appeared his "First Book of English," and in the same year his "Significance of the Alphabet." On the outbreak of the revolution of 1848 he hastened to Europe, but soon returned to Boston, and came in 1851 to New York, where he published in 1852 his "Glossology." He passed the last years of his life at Morrisania, engaged in literary pursuits.

KRAKEN, the name of a sea monster on the coast of Norway, first described by Pontoppidan, bishop of Bergen, in his "Natural History of Norway" (Copenhagen, 1752). The Norwegian fishermen, according to him, often find unexpected shallows a few miles at sea, the depth of the water suddenly diminishing from near 100 fathoms to 20 or 30. This apparent diminution is due to the presence of the kraken, and in such shallows fish are always found in abundance. If the fishermen perceive by their lines that the water is growing shallower, they know that the monster is rising to the surface, and immediately retreat. His back first appears, looking like a number of small islands, and at the lowest computation appearing to be 1½ m. in circumference. His arms rise above the surface like the masts of a vessel, and are said to have power to grasp the largest man-of-war and pull it to the bottom. When he sinks again, he causes a swell and whirlpool which endangers all the ships in the vicinity. The story of the kraken is now admitted to be

fabulous, and is supposed to owe its origin to exaggerated accounts of enormous whales or polypi.

**KRANACH, LUCAS.** See CRANACH.

**KRASICKI, IGNAOY,** a Polish poet, born at Dubiecko, Galicia, Feb. 8, 1784, died in Berlin, March 14, 1801. He was educated at Lemberg, took holy orders, and early displayed great literary genius and conversational power. He became a favorite of King Stanislas Augustus, and after having officiated as coadjutor of the bishop of Ermeland or Warmia, he succeeded to the see after the death of the latter in 1766. In 1772, on the first partition of Poland, Ermeland became part of Prussia, and Krasicki, who now transferred his allegiance to Frederic the Great, was soon as high in the favor of his new master as he had been in that of his old. In 1795 he was raised to the archbishopric of Gnesen, to the cathedral of which his remains were removed in 1829. His literary activity embraced a wide range. He wrote a heroic epic (the "War of Chocim"), and many small poems which are replete with wit. The best of his novels, *Pan Podstoli*, is a satire on the foibles of his countrymen. He translated Ossian, Plutarch, and other works, but is most celebrated for his fables, in which he endeavored to imitate La Fontaine, and for his comic epics. The most valued of them, his *Monachomachia*, ridicules the monkish system and exhibits its peculiarities in strong colors. Dmochowski, who pays a glowing tribute to his genius, prepared an edition of his works (10 vols., Warsaw, 1808-'4). A stereotyped edition appeared in Breslau in 1824, and a new edition of the whole in one double-columned 8vo. vol. in Paris in 1881.

**KRASINSKI, VALERIAN,** count, a Polish writer, born in the ancient Polish province of White Russia about 1780, died in Edinburgh, Dec. 22, 1855. He was a scion of the illustrious Krasinski family, whose former palace is now used as the government house of Warsaw, and belonged to that branch of it which at an early period had embraced the Protestant religion. Having enjoyed the highest educational advantages, and being of great natural ability, he was at an early age appointed chief of a department of the ministry of public instruction, which was charged with the superintendence of all dissenters. He exerted himself strenuously in their behalf, and established a college for Jewish rabbis at Warsaw. On the outbreak of the Polish revolution in 1830, he was sent on a diplomatic mission to England, where, after the subjugation of his unfortunate country by Russia, he was compelled to remain an exile. He resided in London until 1850, when he removed to Edinburgh, and was much respected in the best circles of both cities for his elegant culture and extensive learning, as well as for the honorable manner in which he supported himself by his pen. He learned to write in English with great facility, and was an active contributor to the periodical press. His principal works are: "The Rise, Progress, and Decline of the Reformation

in Poland" (2 vols., 1839-'40); "Lectures on the Religious History of the Slavonic Nations" (1849); and "Montenegro and the Slavonians in Turkey" (1853).

**KRASZEWSKI, JOZEF IGNAOY,** a Polish author, born in Warsaw, July 26, 1812. He was educated at Wilna, travelled extensively, and has written several historical and topographical works, over 100 novels, the best of which are said to be the "Magic Lantern" and "Under Italian Skies," and many poems, among which his "Anafielas" and "Satan and Woman" are most admired. He has also written books of travel, plays, and critical works on art and literature, beside editing the principal literary journal of Poland (the "Athenæum," published at Wilna). He is justly regarded as the most fertile Polish man of letters of the present day.

**KRAUSE, KARL CHRISTIAN FRIEDRICH,** a German philosopher, born in Eisenberg, May 6, 1781, died in Munich, Sept. 27, 1882. He was educated at Jena, where he attended the lectures of Reinhold, Fichte, and Schelling, and was extraordinary professor from 1802 to 1804. He then renounced teaching to devote himself to the wide range of studies which he deemed necessary to give completeness to his philosophical system, resided successively in Rudolstadt, Dresden, and Berlin, made several journeys through Germany, France, and Italy, and lectured at Göttingen from 1824 to 1831, when he retired to Munich. The aim of his speculations was to represent the collective life of man as an organic and harmonious unity; and he conceived the scheme of a public and formal union of mankind, which, embracing the church, state, and all other partial unions, should occupy itself only with the interests of abstract humanity, and should labor for a uniform and universal development and culture. The germ of such a union he thought he found in freemasonry, to which he rendered great service by his works. Among his more important works are: *Vorlesungen über das System der Philosophie* (Göttingen, 1828), and *Vorlesungen über die Grundwahrheiten der Wissenschaft* (Göttingen, 1829).

**KREMLIN,** a celebrated fortress of Moscow, intimately associated with the history of the Russian empire, the residence of its ancient czars, and the heart of its ancient capital. It was first built of stone at the end of the 14th century, after having previously existed in a temporary form, and is situated on an eminence, at the foot of which flows the Moskva river. It is surrounded with walls from 12 to 16 feet thick, and from 28 to 50 feet high, with battlements, embrasures, numerous towers, and 5 gates, and forms, with its beautiful gardens, nearly a triangle of somewhat more than a mile in circumference. The Kremlin contains many cathedrals, churches, monasteries, and belfries, and some of the finest public buildings and monuments of Moscow, which, together with its commanding situation, its lofty walls with the variously colored towers, steeples, and domes, present a peculiar and imposing aspect. The

gate most celebrated by its sacred associations is that of the Redeemer. A picture of the Saviour hangs over the arch of this gate, and no person, not even the emperor, passes through it without signs of reverence. Many of the population remove their hats at 20 paces off, and on their way to and from the river turn toward the holy gate bowing and crossing themselves. Near another gate stands a little chapel or rather shrine, with the miraculous picture of the "Iberian Mother of God," which attracts crowds of worshippers. The Cathedral place on the height of the Kremlin—a consecrated spot, surrounded by Ozar Nicholas with a magnificent iron grating—contains the cathedrals of the Assumption and of the archangel St. Michael. In the former are the tombs of the patriarchs of the Greek church, and in the latter those of the czars down to Peter the Great. The cathedral of St. Basil, situated on the Red square between the walls of the Kremlin and those of the Kitai Gorod, is noted for its grotesque architecture. The paved court of the Kremlin is surmounted by the walls of the tower of Ivan Velikoi (the Great), presenting from its summit one of the most remarkable views in the world. On a granite pedestal at its foot stands the monster bell (*tsar kolokol*, or emperor of bells). In one of the lower stories of the tower is another bell of remarkable weight, and in the other stories are at least 40 or 50 smaller bells, all of which are rung during the whole of Easter week. The house of the Holy Synod is among the remarkable buildings of the Kremlin, containing the library, treasury, and wardrobe of the Russian patriarch, and the holy oil (*mir*) used for sacraments. Another immense pile of buildings contains the offices of the local government, and the arsenal and treasury, the former famous for its collection of arms, and the latter for its jewelled thrones and crowns, and other historical relics. The most important remains of the ancient palace of the czars are the Terema and the Granovitaya Palatas, the latter containing the coronation hall. The main body of this building was fatally injured by the French, and a new palace was erected in its stead by the emperor Alexander, called Bolshoi Dvoretz (great palace). By its side are the ruins of both the ancient palaces, which are connected with the new one by stairs and galleries. The Terema palace was repaired by order of the late emperor Nicholas, and the ancient aspect of the building carefully preserved. Adjoining the Granovitaya palace is the new or little palace, completed in 1850, and remarkable for its magnificence.—Napoleon I., after the invasion of Russia, took up his residence in the Kremlin, Sept. 15, 1812. The place is pointed out in the Terema palace from which he is said to have watched the progress of the fire, which compelled him to leave it on the evening of Sept. 16. He returned to it on Sept. 20, and finally departed Oct. 19. The coronation of the present emperor, Alexander II., took place in the Kremlin in 1856.

KREMINTZ (Hun. *Körmöcs-Bánya*, the lat-

ter word meaning mine), the principal mining town of Hungary, in the county of Bacs; pop. about 6,500. It is situated in a deep valley surrounded by rugged hills and mountains, has several suburbs, a mint, various mining establishments, smelting and washing works, a vitriol factory, paper mills, and other manufactories, and contains the principal offices of the surrounding gold and silver mining region. An aqueduct supplies it with water. Its mines consist of about a dozen principal and various minor shafts, the produce of which has greatly decreased in recent times. The Austrian ducats are coined in Kremnitz. It was formerly a place of considerable importance, and as a free royal city had its representation in the diet under the Hungarian constitution.

KRISHNA, a river of India. See KISTNAH.

KRÜDENER, JULIANE DE WITTINGHOFF, baroness, a Russian novelist and mystic, born in Riga, Nov. 11, 1764, died in Karasubazar, Dec. 15, 1824. She was carefully educated in the house of her father, the baron of Wietinghoff, one of the wealthiest proprietors in Livonia, and was early remarkable for intelligence and for a tendency to revery and melancholy. In 1777 she visited Paris with her parents, and on her return at the age of 18 was married to a Russian diplomatist, Baron Krudener, whom in 1784 she accompanied to Venice and other cities of Italy, and afterward to Copenhagen and Paris; and in 1791 she made a journey through the south of France. Of a singularly naïve and romantic character, she was guilty of numerous indiscretions, which led to a separation from her husband in 1791. After an adventurous life, with a reputation for beauty and wit, in various cities of Europe, she went to Paris in 1803 with literary schemes. Her romance of *Valérie* appeared in that year, marked by a vague melancholy and light and graceful style, which, with the support of her friends, secured it a brilliant success. Returning to Riga, and remaining for a time in retirement, she resolved to change her manner of life, and to devote herself solely to the conversion of sinners and the consolation of the wretched. In this pious design she was confirmed by travelling in Germany, by correspondence with the Moravian brethren, and by an acquaintance with the theosophist Jung-Stilling. Her correspondence for several years abounds in mystical effusions, more elegant though less profound than those of Mme. Guyon, and reveals her double tendency to illuminism and to worldly frivolity. At Paris in 1814 she held religious assemblies in her house, which were frequented by the most important personages. Her spiritual exaltation assumed the character of prevision, and in a letter she foretold in vague terms the escape of Napoleon from Elba, his triumphant return to Paris, and the second exile of the Bourbons. This letter was communicated to the emperor Alexander of Russia, in whom it awakened great interest toward her, and whom she met at Heilbronn in May, 1816, and accompanied to Heidel-

berg, the head-quarters of the allies, and after the battle of Waterloo to Paris. So illustrious a patron attracted around her persons of all ranks and opinions. She was present at the grand review of the Russian army in the plain of Châlons in 1815, which she described under the title of the *Camp des vertus* (1815). The articles of the holy alliance are said to have been submitted to her revision. Her doctrines, agreeing with the forms of no Christian communion, caused several of the German states to forbid her residence in them, and she prosecuted her schemes of charity in the midst of persecutions. She passed the latter part of her life among the poor and the sick, manifesting an unwearied ardor, and joyously sacrificing herself for the solace of the wretched. In 1818 she returned to Russia, where the emperor continued his interest in her romantic views, but forbade her to preach publicly. She lost his favor, and was ordered to leave St. Petersburg, when, in her enthusiasm for the cause of the Greeks, she divulged some of his communications on the policy of the czars in the East. Her health was suffering from ascetic rigors, when early in 1824 she joined with the princess Galitzin in the scheme of founding a colony in the Crimea, which was to consist of her disciples. She arrived at Karasubazar, the site selected, in September of that year, and was busy in preaching in French and German to the astonished inhabitants, till after a few months the malady which had afflicted her before her arrival caused her death. The sincerity of Mme. de Krüdener in her mysticism and her apostolic labors has not been questioned.—See Eynard, *Vie de Madame de Krüdener* (Paris, 1849).

KRUG, WILHELM TRAUOGOT, a German philosopher, born in Radia, June 23, 1770, died in Leipzig, Jan. 13, 1842. He was educated at the university of Wittenberg, where in 1794 he became adjunct of the philosophical faculty. A work which he published, *Ueber die Perfectibilität der geoffenbarten Religion* (Jena and Leipzig, 1795), was the cause of his not receiving a professorship, and was followed by other works, chiefly in development of the Kantian philosophy, of which he was one of the most efficient promulgators. In 1801 he was appointed professor of philosophy at Frankfort-on-the-Oder, and published in 1803 his principal work, *Fundamental Philosophie*, in which he proposed a system under the name of "transcendental synthetism," which, as he maintained, reconciled idealism and realism. In 1804 he succeeded Kant as professor of logic and metaphysics at Königsberg, and in 1807 succeeded Kraus also as professor of practical philosophy. In 1809 he accepted a professorship of philosophy at Leipzig, which he held till 1884, when he received a pension from the state. He took an active part not only in the philosophical and religious, but also the political and social discussions of his time; was one of the presidents of the democratic society founded at Königsberg after the peace of Tilsit under the name of the *Tugend-*

*Bund*; joined in 1813 the Saxon corps of *chasseurs à cheval*; and was afterward a leading champion of German liberalism against Anouillon, Kotzebue, and others. Among his more important works are: *Allgemeines Handwörterbuch der philosophischen Wissenschaften* (4 vols., Leipzig, 1827-'8), and an autobiography entitled *Meine Lebensreise in sechs Stationen, von Urceus* (Leipzig, 1826).

KRUMMACHER, FRIEDRICH ADOLF, a German poet and theologian, born in Tecklenburg, Westphalia, July 18, 1768, died in Bremen, April 14, 1845. His first appointment was to the professorship of theology in the university of Duisburg. He next became pastor of the Reformed church at Orefeld, and afterward exchanged that cure for the rural living of Kettwich. In 1819 he was called to Bernburg, where he became councillor of the consistory and chief pastor, and in 1824 became pastor of St. Anschaire in Bremen. He was a voluminous writer, both in prose and poetry. His principal works are: "Cornelius the Centurion," "Life of St. John" (both translated into English, Edinburgh, 1840); "The Sufferings, Death, and Resurrection of Christ"; *Die Kinderswelt*, a series of sacred poems for the young; and "On the Spirit and Form of Evangelical History in its Historical and Aesthetic Relations." He is best known, however, by his fables or *Parabeln*, which appeared in 1805, and passed through many editions. They have been translated into English, and added in 1858 to Bohn's "Illustrated Library," with 40 illustrations on wood, by the brothers Dalziel. His life has been written by Möller (*Friedrich Adolf Krummacher und seine Freunde*, 2 vols., Bonn, 1849).—GOTTFRIED DANIEL, brother of the preceding, born in Tecklenburg, April 1, 1774, died in Elberfeld, Jan. 30, 1887. He was educated at Duisburg, and afterward became a popular preacher at Bärth and Wolfarth. In 1816 he was made pastor of the Reformed church at Elberfeld, and was recognized as the head of the pietists in that district. Among his most important works are *Die evangelische Heiligung* (Elberfeld, 1832), and *Tägliches Manna*, or "Daily Manna" (1838).—FRIEDRICH WILHELM, son of Friedrich Adolf, and also a conspicuous minister of the Reformed church, but a strenuous opponent of the rationalistic school of theologians. In 1843 he declined an invitation to a theological professorship at Merseburg, Penn. He is now (1860) chaplain of the Prussian court at Potsdam, and is regarded as one of the most eloquent preachers in Germany. Among his numerous works, most of which have been translated into English, are "Elijah the Tishbite," "The Last Days of Elisha," "Solomon and the Shulamite," "Sermons on the Canticles," "Glimpses into the Kingdom of Grace," &c. In 1856 appeared in Berlin his *Bussen und Stahl*.

KRUSENSTERN, ADAM JEAN, chevalier de, a Russian navigator, born in Haggud, Esthonia, Nov. 8, 1770, died in Esthonia, Aug. 12, 1846. From 1793 to 1799 he was in the Eng-

lish service. During the reign of Alexander, Krusenstern was promoted to the rank of captain in the Russian navy, and placed in command of a scientific and commercial expedition, planned by himself, and which sailed from Cronstadt, June 26, 1803, to explore the north Pacific coasts of America and Asia. One object of the expedition was to establish relations with the court of Japan. Though this was not accomplished, the expedition was of much service to the scientific world. It was described by Espenbourg, Lissjanskoi, Von Langsdorff, Tilesius, and in part by Krusenstern himself in his *Reise um die Welt in den Jahren 1803-6* (8 vols., St. Petersburg, 1810-'12), which has been translated into many European languages (English translation by Hoppner, London, 1818; French, 1821). In 1824 Krusenstern was appointed curator of the university of Dorpat.

KRYLOFF, or KRILOFF, IVAN, a Russian fabulist, born in Moscow, Feb. 18, 1768, died in St. Petersburg, April 28, 1844. While a boy he wrote several comedies, and, having obtained a place as clerk in one of the public offices, devoted his leisure to study. In 1801, having been recommended to the empress Maria, he became secretary to Prince Gallitzin. This office, however, was purely honorary, and he spent several years at the country house of the prince, engaged in literary labors. In 1812 he received an appointment in the imperial library, and in 1830 he was made councillor of state. He wrote plays, and contributed to various journals and periodicals, but was most successful in writing fables in imitation of those of La Fontaine. Mrs. Robinson, in her work on the literature of the Slavic nations, says: "He may be truly called the favorite of the Russian nation. His fables, equally popular among all classes and conditions of life, are the first books that a Russian child reads. A considerable portion of them have been translated into French and Italian; partly by Count Orloff, at Paris, and partly by friends of the latter, ladies and gentlemen of the most fashionable society in that capital, among whom that nobleman distributed the labor of translation. He then published them with the original in Paris in 1825. The perfect harmlessness and *naïveté* of the author made him also a favorite of the government; and when he celebrated his 70th birthday, honors and distinctions of all kinds were accumulated on his head." The best German translation is by Torney (Mitan, 1842).

KSHATTRIYAS. See BRAHMA.

KUEN-LUN, or KOOLKON, a mountain range of central Asia, forming the N. boundary of Thibet, and separating it from Chinese Tartary, the desert of Gobi, and the Koko-nor territory. It runs from W. to E. on the parallel of 36° N. lat., until near long. 92° E. it is broken by the irregular mountain groups around Lake Koko-nor. The Nan-shan and Kilian-shan ranges may be considered as its E. prolongations. At the W. end it is connected with the Hindoo Koosh, near its union with which it is attached on the

N. to the Bolor Tagh, a great chain running N. and S. along the E. frontier of Independent Tartary. The Karakorum range, with which the Kuen-lun is often said to be linked, is really a distinct branch of the Himalaya. The mountain of Shin-khien in the Kuen-lun chain is remarkable for a cavern emitting continual flames which diffuse for some distance an agreeable odor, probably from naphtha; it is not a volcano, but a fire spring. The highest water-shed, according to Hermann and Robert Schlagintweit, who crossed the Kuen-lun in 1856, is near the Karakorum pass, the elevation of which is 18,804 feet. The rivers Yarkand and Karakash take their rise here.

KUGLER, FRANZ THEODOR, a German writer, chiefly on art, born in Stettin, Prussia, Jan. 19, 1808, died in Berlin, March 16, 1858. His "Sketch Book," published in 1830, contained original compositions in poetry, music, and linear design, and in 1833 he published with Reinick an "Artists' Song Book." The history of mediæval art, however, occupied him chiefly, and after a visit to Italy for the purpose of collecting materials, he published in 1837 his "Handbook of the History of Painting from the Age of Constantine the Great to the Present Time," the most comprehensive treatise on the subject which has yet appeared. The approbation with which the work was received caused it to be almost immediately translated into the leading languages of Europe. In England it appeared in 8 separate parts, of which that relating to the Italian schools was translated by Lady Eastlake, with notes by Sir Charles Eastlake; and those comprehending the German, Dutch, and Flemish schools, and the French and Spanish schools, were edited by Sir E. W. Head. The whole work has since appeared in an enlarged and revised form, and is recognized as one of the most trustworthy authorities extant on the subject of which it treats. Among the other numerous works on art which Kugler has published are: "The Polychromy of Greek Architecture and Sculpture, and its Limits," in which a difficult subject is ably treated; a "Description of the Art Treasures in Berlin and Potsdam;" "History of Architecture;" "Schinkel, the Influence of his Theories of Art;" and a variety of short treatises on the present condition of the monuments of art in Germany, the methods taken in neighboring countries to preserve such works, &c. He has been almost equally industrious in other walks of literature, having published a "History of Frederic the Great," illustrated by Menzel, a "Modern History of Prussia," a volume of poems, and several successful dramas. He was also an active contributor to various periodicals devoted to art, and for several years edited the *Museum*, founded by himself in 1833, and the *Kunstblatt*, founded by Schorn. From the year 1833 he held the position of professor of the history of art in the royal academy of Berlin, and for 20 years lectured in the university of Frederic William. He is probably the most

voluminous writer on art of the century, and one whose works have done much to promote a knowledge of the subject.

KÜHNE, GUSTAV, a German novelist, born in Magdeburg, Dec. 27, 1806. He was graduated as doctor of philosophy in Berlin, and has published several novels, of which his *Klosterromane* (Leipzig, 1838) and *Die Rebellen von Irland* (1840) are the best. Less successful as a dramatist, he excels most as a delineator and critic of life and society. His *Deutsche Männer und Frauen* (Leipzig, 1851) is one of his most popular works. He has since published *Skizzen deutscher Städte und Landschaften*, and a novel entitled *Missionär und Proselyt*. He belongs to the "Young Germany" school of politicians and writers, and has done much to promote the establishment of *Kindergärten* after the plan of Froebel, and published on the subject *Froebel's Tod und der Fortbestand seiner Lehre* (Liebenstein, 1852). He purchased from Lewald the magazine *Europa*, and has edited it since 1846.

KUMAON, a British province of Hindostan, in the lieutenant-governorship of the N. W. provinces, bounded N. E. and E. by the Himalaya and Nepal, S. W. by Rohilkund, W. by the Dehra Doon, and N. W. by the native state of Gurwhal, lying between lat. 29° 5' and 30° 6' N., and long. 78° 17' and 80° 56' E.; area, 6,962 sq. m.; pop. 166,755. The surface is very diversified. The S. portion is either forest-clad plain almost destitute of water, or marsh land, while toward the N. the surface is broken by numerous mountains, some of which are among the highest in the world. The climate in the low region is sultry and deadly; in the Alpine districts, temperate, invigorating, and healthful. Earthquakes are common. The principal rivers are the Kali, Goonka, Aluknunda, and Ganges. The valleys and low lands are fertile, and in the warmer districts yield two crops annually. The tea shrub has been successfully introduced. The chief mineral productions are gold, lead, copper, and iron. The gold is chiefly found in the sands of the Aluknunda. The principal manufactures are blankets, coarse linens and cottons, and bamboo mats and baskets. A large portion of the inhabitants are engaged in the transit trade between Chinese Tartary and India. The population is composed of 8 races: Hindoos, who are the most numerous, consisting of Brahmins (of whom about 6,000 families are supposed to be scattered over the district) and Rajpoots; the Bhotias, of Tartar stock; and the Doms, who perform all menial employments. A corrupt form of Brahminism is the dominant faith. Kumaon is famous for the number of its shrines and temples, mostly situated at the confluence of its rivers. Those most celebrated as places of pilgrimage are Kedarnath, Badrinath, Deoprayag, Rudraprayag, and Vishnuprag. Kumaon was never conquered by the Mogul emperors, but was subdued by the Gorkhas in the latter part of the 18th century. It became a British province in 1815. Capital, Almora.

KURRAOHEE, a seaport town of Sinde, Hindostan, on the Arabian sea, W. of the delta of the Indus, and near the frontier of Beloochistan; pop. in 1853, including the suburbs, 22,227. It is built on a plain between the sea and a range of mountains, and has a spacious harbor, obstructed however by a bar which cannot be safely crossed by vessels drawing more than 16 feet of water. A mole has been built by the British, and a road constructed from it to the town, which is about 3 m. distant. The point of Munorah, at the extremity of a promontory on the S. of the harbor, is fortified. As the only safe port in Sinde, Kurrachee is an important commercial centre, and is moreover the terminus of the Sinde railway, begun in 1858, which will connect it with Hyderabad on the Indus. A submarine telegraph, laid in Jan. 1860, gives it communication with Muscat and Alexandria. Kurrachee exports camels, fish, hides, tallow, ghee, oil, oil seeds, bark, saltpetre, salt, indigo, cotton, and grain, and imports metals, hardware, cottons, silks, twist, and yarn, beside having an active transit trade with Caahmere, Bokhara, Afghanistan, Thibet, and Toorkistan. It contains an English church and school.

KÜSSNACHT, a village of the canton of Schwytz, Switzerland, at the foot of the Rigi, within sight of the lake of Lucerne, at the bottom of the bay of Küssnacht; pop. about 8,000. It is celebrated for its association with William Tell. Near it is the ruined wall called Gessler's castle, although it has been discovered that it never belonged to him, and the hollow way, referred to in Schiller's tragedy of "Tell," through which the Swiss patriot shot Gessler with his unerring arrow. The hollow way has been much filled by the building of a new road. At the end of the lane stands Tell's chapel, which was originally dedicated to the "Fourteen Helpers in Need" (the Saviour, the Virgin, and the apostles).—There is another village of the same name on the lake of Zürich; pop. 2,500.

KUSTENDJI, or KISTENDJIEH, a Turkish town, in the province of Silistria, on the Black sea, about 16 m. from the Danube; pop. about 8,000. It stands upon a level but elevated point of land, which almost assumes the form of a peninsula, near the termination of Trajan's wall, of which traces still exist. The port of Kustendji is shallow, but affords safe anchorage during the summer. The town was called Constantia in ancient times, after a sister of Constantine the Great, who built it, and is still called Kostantza by the modern Greeks. It now consists of about 100 thatched mud cottages. A project of connecting the Danube with the Black sea by means of a canal or railway from this place has often been discussed in late years.

KUTAIIEH, or KUTAYA (anc. *Cotyaum*), a town of Asiatic Turkey, in the eyalet or province of Khudawendghiar, in lat. 39° 25' N., long. 29° 15' 15" E., 180 m. from Smyrna, at the foot of the Pursak-Dagh mountain, in which rises the Pursak river (anc. *Thymbrius*); pop.

about 60,000. It is the residence of the governor-general of Anatolia, the centre of the district where the famous Turkish carpets are manufactured, and of a considerable trade and industry, the surrounding country being extremely productive in grain, cotton, gall nuts, fruits, goats' hair, and wool. The town possesses many mosques, fountains, baths, bazaars, and fine private residences with gardens attached to them. A treaty of peace was concluded there in 1833 between Mehemet Ali and the Turkish government. Kossuth with many of his fellow exiles was detained in Kutaieh from April, 1850, till Sept. 1851. Near the town are some Phrygian remains with inscriptions.

**KUTUSOFF, MIHAIL**, prince of Smolensk, a Russian field marshal, born in 1745, died in Bunzlau, Prussian Silesia, April 28, 1813. He commenced his military career at the age of 16 as a corporal of artillery, and for many years was actively employed in wars against the Poles and Turks, distinguishing himself particularly in the campaigns in the Crimea, in which he was repeatedly severely wounded. In 1783 he became a general of brigade, in 1784 a major-general, and in 1790 he led the terrible assault against Ismail, at the taking of which 80,000 Turks were put to the sword. On this occasion Suwaroff, the Russian general, said of him: "He commanded the left wing of my army, but he was in fact my right arm." In 1791 he was made lieutenant-general, and in the same year contributed materially to the important victory over the Turks at Matchin, which led to the treaty of Jassy. In 1793 he was sent as ambassador to Constantinople, a position which his diplomatic address well qualified him to fill. For a number of years subsequently he filled important military and diplomatic stations under the empress Catharine II. and the emperors Paul and Alexander I.; and in 1805 he entered Germany with 50,000 men to form a junction with the Austrians, which however could not be effected until after the latter had been defeated at Ulm. Kutusoff, though inferior in force to the French, who were commanded by Napoleon in person, gave the corps of Marshal Mortier a decided check at Diernstein, thereby temporarily deranging Napoleon's plans, for which he received from the emperor of Austria the grand cordon of Maria Theresa. He was present at Austerlitz in command of the allied forces, but was not responsible for the disaster of the day, having dissented entirely from the plan of the cross march to outflank the French, the execution of which proved so fatal, and advised a postponement of a general engagement until a junction could be made with the corps of Benningesen and the archduke Charles. In the subsequent war with Turkey Kutusoff gained fresh military laurels, and concluded an advantageous peace at Bucharest in May, 1812. In August of the same year he was appointed to supersede Barclay de Tolly in command of the

Russian forces opposed to the grand army led by Napoleon against Moscow, and joined his troops about 50 leagues from Moscow, on the 29th of that month. The appearance of the veteran, then nearly 70 years of age, inspired confidence and enthusiasm among the Russians, who were dissatisfied with the Fabian tactics of his predecessor, and were clamorous to be led against the French. Kutusoff's judgment seems to have failed him on this occasion, or to have been mastered by his jealousy of Barclay, for he immediately abandoned the strong position selected by the latter at Tzarevoye Zamiashtche, and occupied a much less favorable one at Borodino, where on Sept. 7 he hazarded a battle against the whole French army led by Napoleon in person. Although the issue of that terrible conflict was clearly in favor of the French, the Russians losing 52,000 men, and being obliged to resign Moscow, the national pride of the latter was gratified by this obstinate stand against their enemy, who lost 80,000 men, and Kutusoff received in recompense a field marshal's baton. He subsequently concentrated his forces at Valutino, midway between Moscow and Kalooga, and watching his opportunity, routed the French advanced guard under Murat and Poniatowski at Vinkovo, Oct. 18, an event which precipitated the retreat of Napoleon from Moscow. On the 24th was fought the obstinately contested battle of Malo Jaroslavetz, by which, although the French remained masters of the field, Napoleon was checked in his advance toward the rich province of Kalooga, and compelled to retreat along the wasted line of the Smolensk road. Following the enemy with ceaseless activity, Kutusoff defeated the corps of Eugene Beauharnais at Smolensk, Nov. 16, and on the 2 succeeding days attacked with equal success those of Davoust and Ney at Krasnoi, capturing in these engagements 26,000 prisoners and over 200 pieces of cannon, and inflicting a loss of 10,000 men upon the enemy, his own troops losing but 2,000. As a reward for the skilful manoeuvres which had brought about these successes he was created prince of Smolensk. After the terrible passage of the Beresina he pursued the French more leisurely, foreseeing that the elements would prove sufficiently destructive to them; and upon entering Wilna, where he met the emperor Alexander, in December, he found the campaign virtually ended, although the pursuit was continued as far as Kalisz, where the Russians paused, almost exhausted, in the latter part of January. Having issued from this place a proclamation announcing the dissolution of the confederacy of the Rhine, and calling upon its members to join in the league formed for the deliverance of Germany, he crossed the Oder, and following on the traces of the enemy, reached Bunzlau in Prussian Silesia, where his constitution, enfeebled by the rigors of the campaign, yielded to an attack of malignant typhus fever.

**KUYP, ALBERT.** See **CUYP**.

## L

**L** the 12th letter of the Phœnician and other Semitic graphic systems, named *lamed* (*mal'mād*, ox goad), is also the 12th (λαμβδα) of the ancient Greek (now the 11th, the *digamma* being dropped), Coptic, Armenian, Georgian, Russian (*liudi*; but the 15th Cyrillic and 14th Glagolitic), and most modern European systems; the 14th Rune, the 2d in the Ethiopic and Amharic syllabary, and in the Irish *Bode-loth*; the 28d in Arabic, 27th in Persian and Turkish; the 11th in Latin. It is one of the 4 Liquids of grammarians (*l, m, n, r*), and of the 4 *akshara yavarga* (*ya, ra, la, va*) or semi-vowels in the Devanagari. Its hieroglyph was *laboi*, lioness. The sound is produced by placing the tip of the tongue against the upper incisor teeth, while the breath issues at its sides and the larynx vibrates; and it is hence called a lingual-dental. As a liquid sound it is the symbol of flowing, soft, mild things (*liquor, lenis, mollis, lac*, &c.); as a semi-vowel it is producible and the symbol of linear objects (*longus, linea, linum, ligare, latus, lentus*, &c.), also akin to vowels; by its genesis it is kindred with *d, t, s* (*lingua*, ancient Latin *dingua*, whence *tongue*, German *Zunge*; *λεγω, loquor, dico, signum, sic, doceo*, Eng. *token*, &c.). Priscian attributes to the Latin *L* 3 sounds, one full, one middle, and one slender. There are, indeed, 4 sounds in the European languages alone, viz.: *a*, the plain sound, as in *let*; *b*, the French *mouille*, which is variously written, as in French *aïl, œil, fille, grenouille, Milhau, gentilhomme*, &c.; Spanish *llamar* (Lat. *clamare*), *lleno* (*plenus*), &c.; Portuguese *lhano* (*planus*), *mulher* (*mulier*), &c.; Magyar *hely*, place,  *folyó*, river, &c.; Italian *meglio*, &c.; *c*, the Polish, Ruthenic, and Lusatian *Vendic* barred *z* pronounced by pushing and swelling the tongue to the palate, as in Polish *ptosa*, Ruth. *petechaty*, Gr. *πελλος*, black-gray; *d*, the Welsh *ll*, pronounced with a hissing, as in *llŷn* or *llŷn*, temple, *Lloyd*, &c., almost as if written *fl*, as in *flannel* (Lat. *lana*, wool).—Some nations and persons cannot pronounce *l*, as for instance the Japanese, who use *r* in its stead, as in *Sagario* for Saghalien or Amoor. The Chinese, on the contrary, unable to utter *r*, always substitute *l*, as in *Kilisiit* for Christ. There was no *L* in Zend. It is often mute in English before consonants, as in *could, calm, half, psalm*, &c., and when final in some French words, as in *baril, outil, sourcil, in file*, &c. In Latin it was anciently not doubled, as in *ma-celum, polu-cere*; it is often introduced into Latin words for the sake of assimilation, as in *alligare, pellucere, intelligere* (from *ad, por, in-ter*), &c.; it frequently indicates diminution, as in *libellus, agellus, paucillum* (from *liber, ager, parum*), &c., and distinguishes many words of

political and religious import, ending in *alia*, from those of common things which end in *aris*, *arius*; thus: *auguralis, regalis, ritualis*, &c.; but *militaris, culinaris, aquarius, vestiarius*, &c.—The letters with which it interchanges are *r, n, m, d, t, u*. Examples: *sol*, Eng. *sun, summer*, Lat. *ser-enus*; Portug. *nobra, praezer, igreja*, &c., for noble, *placer, ecclesia*; Span. *engrudo* (gluten), &c.; Fr. *apôtre, épître, orme*, from *apostolus, epistola, ulmus*, &c.; *frapper*, to flap; Eng. *pilgrim*, from *peragrinus*; Span. *peligro*, from *periculum*; Eng. *colonel*, pronounced *kurnel*; Hebrew *sharsh'rah*, Arab. *silsil*, chain, &c.; Gr. *λειπών*, Lat. *lilium*, *Nymphæ*, *lymphe*, *Berystos* and *βελυστος*; Lat. *lutra*, Span. *nutria*, otter; Provençal, *namela*, Lat. *lamella*; Fr. *niveau*, Lat. *libella*; Wallach. *funingine*, Lat. *fuligine*; Heb. *nātan*, Syr. *natal*, to give; Heb. *tzalem*, Arab. *banam*, image, &c.; Heb. *gulgolet*, Arab. *djumdjumat*, skull, &c.; Gr. *Ὀδυσσεύς*, Ulysses; Lat. *olere* and *odor*; Fr., Span., &c., *amidon*, from *αμυλον*; Chald. *ezal* and *ezad*, to go away, &c.; Ital. *fiore, chiamare, bianco*, &c., for *flore, clamare, blanco*; Gr. *αλλος, φυλλον*, Lat. *alius, folium*, &c.; Fr. *cou, mou, coucher, beau, chaud, il va, il faudra, chevaux*, &c., for *col, mol, colchior* (*collocare*), *bel, calx, valet, falloir, cheval*; Dutch, *oud, goud*, &c., Eng. *old, gold*; Eng. *stout*, Germ. *etola*.—*L* is sometimes dropped, as in Ital. *arbiato* for *labinato*, *usignolo* for *lusignuolo* and *rossignuolo*, Span. *ruiseñor* (Lat. *lusciniola*); Portug. *o, a*, article, for *lo, la*; *candêa, côr, sauda, taes, voar*, &c., for *candela, color, salute, tales, velors*; *azuro*, Span. *azul*, from Persian *lazur*, blue, &c. It is sometimes also transposed: Span. *prestado, ornaldoa, espalda*, &c., for *prestado, ornadlos, spatula*; and *milagro, palabra*, Portug. *pulvigo, esmola*, &c., from *miraculum, parabola, publico, elemosyna*; Ital. *padula*, Wallach. *plumens*, &c., for *palude, pulmone*.—As a numeral sign, *L* denotes 80 in the Semitic (except Ethiopian, where it marks 2), Greek, Russian, Armenian, Cyrillic, and Georgian; 50 in Latin and Glagolitic (in the former as being a half of the ancient *L* or *O*, *centum*). A dash above it raises these values to as many thousands. In rubrication it marks 11. In abbreviations it stands for *Lucius, Lelius, Lares, libens, libertus, locus, latus*, &c. *LIS* stands for *sestertium numus*. On French coins it stands for Bayonne.

**LAALAND**, an island in the Baltic belonging to Denmark, lying between lat. 54° 39' and 54° 57' N., and long. 10° 56' and 11° 50' E.; greatest length 60 m., breadth 20 m. The district of Laaland comprises the island of that name, Falster, and several small islands; area, 647 sq. m.; pop. in 1858, 84,096. The surface

is low, level, and mostly marshy. The water is bad, and the climate unhealthy, but the soil is fertile. There is a lake called Mariaboe near the centre of the island, which is almost 5 m. in length. Capital, Mariaboe.

LABADIE, JEAN DE, a French mystic, born in Bourg-en-Guienne, Feb. 13, 1610, died in Altona, Holstein, Feb. 13, 1674. He was educated at the Jesuits' college of Bordeaux, and was for some time a member of that society; but in 1650 he became a Protestant, settled at Montauban, was elected pastor of the church, and remained there 8 years, during which he founded a mystical sect, resembling the quietists of his old communion, and called after himself Labadists. Having been at length banished from Montauban for sedition, he retired first to Orange, and subsequently to Geneva, whence in 1666 he was invited to Middleburg, Holland. Here his followers increased in number, and included many persons of rank and education, among whom were Anna Maria von Schurmann and the princess palatine Elizabeth. The heterodoxy and contumacy of Labadie, however, led to his deposition by the synod of Naarden, and to his banishment from the province. Withdrawing to a small village near Amsterdam, he formed a church there, and established a press for the publication of his theological and controversial works, whence he was ultimately compelled to remove to Altona. The sect of which he was the founder does not now exist.

LABARRE, CHEVALIER DE. See BARRE.

LABARUM, the military ensign of the Roman emperors in the later times. It consisted of a long pike, traversed by a staff, which gave it the form of a cross, from which hung a bandrol of purple, adorned with gold and precious stones, and bearing on its summit a crown emblazoned with the monogram of Christ, which was added by Constantine. The labarum, called by Eusebius the saving standard of the empire, was intrusted to a chosen guard of 50 soldiers, who were believed to be invincible while engaged in the execution of their office. On the medals of Constantine and other Christian emperors it is represented as borne by Victory.

LABAT, JEAN BAPTISTE, a French missionary and historian, born in Paris in 1663, died there, Jan. 6, 1738. He entered the order of the Dominicans in 1685, taught philosophy at Nancy, afterward devoted himself to preaching, and in 1693 solicited an appointment as missionary to the Antilles. After remaining two years at Martinique, he passed in 1696 to Guadeloupe, where he established a station of his order, and also distinguished himself as an engineer and agriculturist. On his return to Martinique he was appointed *procureur général* of the mission, and for his diplomatic and scientific services was held in great esteem by successive governors. He explored the archipelago of the Antilles, founded in 1703 the city of Basse-Terre, and in that year took an active part in the defence of the island against the English. He organized a company of 60 negroes, who, as he said, destroy-

ed more of the enemy than all the French troops. By the decease of his associates, he gradually united in his own person nearly all the higher offices of his order in the Antilles, and in 1705 returned to Europe to obtain recruits. He was detained by his superiors at Rome till 1709, and at Civita Vecchia till 1716, after which he went to Paris, where he remained till his death. His principal works are *Nouveau voyage aux îles de l'Amérique* (6 vols. 12mo., Paris, 1722), *Nouvelle relation de l'Afrique occidentale* (5 vols., 1728), and *Voyage en Espagne et en Italie* (8 vols., 1730).

LABDANUM. See LABDANUM.

LA BILLARDIÈRE, JACQUES JULIEN HOUTON DE, a French traveller and naturalist, born in Alençon, Oct. 23, 1755, died in Paris, Jan. 8, 1834. After studying botany at Montpellier, he was graduated M.D. in Paris in 1780. Six years later he was sent on a scientific mission to Syria and Palestine, made a thorough exploration of the mountains of Lebanon, and brought back a valuable collection of plants. The results of his journey were published in his *Icones Plantarum Syria Bariorum Descriptionibus et Observationibus Illustrata* (4to., Paris, 1791-1812), with elegant drawings by Redouté. When the expedition under Entrecasteaux was sent in search of La Pérouse in 1791, La Billardièrre sailed on board the *Recherche*, spent a few months at the Cape, where he collected a number of plants, visited many of the large islands and archipelagos in the Pacific ocean, barely escaped shipwreck on the coast of Australia, and was finally taken prisoner at Java by the Dutch in Oct. 1793. His botanical collections, consisting of no fewer than 4,000 plants, three fourths of which were of species previously unknown, were carried to England; but when, after a captivity of nearly two years, he returned to his native country, they were courteously returned to him through the intervention of Sir Joseph Banks. In 1800 he was elected a member of the academy of sciences, and thenceforth devoted his whole time to arranging his botanical treasures and to publishing the results of his observations.

LABLACHE, LUIGI, an Italian singer, born in Naples, Dec. 6, 1794, died there, Jan. 28, 1858. His father, a French merchant from Marseilles, dying in 1799, young Lablache was, at the recommendation of Joseph Bonaparte, placed in one of the conservatories of Naples, where he studied vocal and instrumental music. He was of an idle and unruly disposition during his first connection with this institution, and attempted no fewer than 5 times to make his escape, in order to procure an engagement in some theatre. Having been compelled by the interference of the police to finish his studies, he made his début in 1812 at the little theatre of San Carlino as a buffo singer. Within a few months he was married to the daughter of the actor Pinotti; and after fulfilling engagements as basso and buffo at minor theatres in Naples, Messina, and Palermo, he appeared in 1817 at

the Scala theatre in Milan in Rossini's *Cenerentola*, with such success that Mercadante wrote for him the opera of *Elisa e Claudio*, and for several seasons he filled the leading basso parts in that city. In 1824 he sang for the first time before the Viennese, who in their enthusiasm caused a medal to be struck in his honor, and thenceforth held him in equal estimation with their favorites, Madame Fodor and Rubini. After an absence of 12 years Lablache returned to Naples to assume the duties of royal chapel-master and fill an engagement at the San Carlo theatre, and appeared in the works of Rossini and Bellini with great reputation. In 1880 he went to Paris and London, where, in the maturity of his powers, he made his debut at the Italian opera in the character of Geronimo in *Il matrimonio segreto*. Thenceforth until within a short time of his death, with the exception of the year 1883, when he returned to Naples to sing in the *Elisir d'amore*, he appeared chiefly in Paris and London, devoting the winter to the former place and the spring to the latter. During the last 25 years of his life he held the position of the leading basso of his own and perhaps of any other time. His voice, a base of the purest quality, unsurpassed in resonance, in flexibility and compass, was not less remarkable than his artistic skill in the management of it, and his dramatic versatility. His range included every variety of dramatic music, from lofty declamation to the broadest buffo, in all of which he attained a high degree of excellence. Originally of an imposing and graceful presence, he became exceedingly corpulent in middle life, although this circumstance never detracted from the impressiveness of his performance in serious parts; and his name will be not less closely associated with the operas of *Norma*, *Anna Bolena*, *Semiramide*, or *I Puritani*, than with the comic extravagances of Leporello, Dr. Bartolo, Dr. Dulcamara, or Don Pasquale. In private life he was distinguished by social accomplishments and virtues, and enjoyed the esteem of many outside of his profession. He was at one time employed as singing master of the queen of England, of whom he was a special favorite.—His only daughter is the wife of Thalberg the pianist.

LABOR, in physiology. See BIRTH.

LABORATORY, a place for chemical operations, either designed for manufacturing purposes, or for experimental research. In the latter case it should properly comprise several rooms, one or more devoted to furnace operations and furnished with the requisite apparatus for these, as also with various tools adapted for small work in metals. Another room should be appropriated to the more delicate chemical operations, and all should be well ventilated by flues constructed expressly for carrying off noxious vapors. An apartment especially protected from these should be devoted to the balance and other delicate instruments that are liable to injury. Water as pure as possible should be supplied in unlimited quantity; and illuminat-

ing gas, for use by the various methods now conveniently employed as fuel for heating crucibles and other vessels, has become almost an essential element in modern laboratories. For details of the fitting up and furnishing of laboratories with apparatus and the use of the same, Faraday's "Chemical Manipulation" may be advantageously consulted; and no laboratory would be complete without this work always at hand for reference. See also "Chemical and Pharmaceutical Manipulations," by Campbell Morfit (Philadelphia, 1857).

LABORDE, JEAN BENJAMIN DE, a French author and composer, born in Paris, Sept 5, 1734, guillotined July 22, 1794. He belonged to a wealthy family, and was thoroughly instructed in all the accomplishments of the age, including music, for which he showed a great fondness. Introduced at court while a young man, he became a confidant and favorite of Louis XV., and dissipated in costly pleasures nearly the whole of his fortune. He did not neglect however to cultivate his taste for music, and during the life of his patron produced several successful operas. Upon the death of Louis, having been appointed one of the farmers-general of the kingdom, he married and led a more regular life, repairing by the profits of his office the losses incurred by his youthful follies. He also gave himself seriously to his musical studies, and in 1780 published his *Essai sur la musique ancienne et moderne* in 4 vols., an unequal work, but one containing speculations and information which are still regarded as of great value. He published also several other works on history, chronology, and geography. At the breaking out of the revolution he became obnoxious in consequence of the office he held, and retired to Rouen; but being discovered, he was arrested, brought back to Paris, tried, condemned, and executed.

LABORDE, JEAN JOSEPH, marquis de, a French financier, born in Jacca, Aragon, in 1724, guillotined in Paris, April 18, 1794. He amassed a large fortune in mercantile operations, and under the Choiseul ministry rendered important financial assistance to the French government, for which he was rewarded by the appointment of court banker and the title of marquis. When the French took part in the American war, he furnished the king with the money necessary for despatching the troops. He was a friend of Voltaire, whose affairs he managed gratuitously. Toward the end of 1793 he was arrested, and, after a few months' imprisonment, sentenced to death by the revolutionary tribunal, as having participated in the royalist plots which aimed at the subversion of the republic.—ALEXANDRE LOUIS JOSEPH, comte de, son of the preceding, a French writer, archæologist, and politician, born in Paris, Sept. 15, 1774, died in 1842. He was sent to Vienna at the beginning of the French revolution, entered the Austrian army, reached the rank of major, and returned to his native country after the treaty of Campo Formio, 1797. He then de-

voted himself to travels and artistic pursuits. In 1800 he accompanied Lucien Bonaparte, ambassador to Spain, in the capacity of *attaché*, and during nearly two years explored the various provinces of the peninsula, in company with a number of artists, whose expenses he paid from his own purse. On his return to France, he undertook the publication of his great work, *Voyage pittoresque et historique de l'Espagne* (4 vols. large fol., 1807-'18), which cost him the best part of his fortune. In 1809 he was appointed master of requests in the council of state, and in 1814, as adjutant-major of the national guard, took part in the capitulation of Paris, and received honorary distinctions at the hands of Louis XVIII. In 1822 he was elected to the chamber of deputies, and kept his seat almost without interruption until 1840. He took an active part in the revolution of 1830, held for a while the office of prefect of the Seine, and left it to become aide-de-camp to Louis Philippe, with the rank of brigadier-general in the national guard. He was a member of the academy of inscriptions, and of the academy of moral and political sciences. Beside the *Voyage de l'Espagne*, he published: *Itinéraire descriptif de l'Espagne* (5 vols. 8vo., with an atlas, 1809); *Les monuments de la France, classés chronologiquement*, &c. (fol., 1816-'26); *Voyage pittoresque en Autriche, avec un précis de la guerre entre la France et l'Autriche*, 1809 (3 vols. fol., 1821-'3), &c.—LÉON EMMANUEL SIMON JOSEPH, comte de, son of the preceding, a French writer and archæologist, born in Paris, June 18, 1807. After completing his classical studies at the university of Göttingen, he travelled in the East, and on his return published, in conjunction with M. Linant, his *Voyage de l'Arabie Pétrée* (Paris, 1830-'33), and *Flore de l'Arabie Pétrée* (4to., 1833). He meanwhile filled several diplomatic offices, but gave them up in 1836 to devote himself entirely to his literary and artistic pursuits. He undertook at once a large and splendid publication, *Voyage en Orient*, 36 parts of which, consisting of travels in Asia Minor and Syria, have appeared. At the same time he turned his attention to historical researches on printing and engraving, and published several works on this interesting subject. In 1842 his *Commentaire géographique sur l'Exode et les Nombres* secured his election to the academy of inscriptions. On his father's retirement from political life, he entered the chamber of deputies, where he showed little interest in political questions. In 1845-'7 he published a series of letters on public libraries, the 4th of which, on the Mazarin palace, is full of historical interest. This led him to a larger illustrated publication, *Les monuments de Paris*, the first part of which was published in 4to. in 1846. He is also the author of the following unfinished works: *Les ducs de Bourgogne, études sur les lettres, les arts et l'industrie durant le 15<sup>e</sup> siècle* (3 vols. 8vo., 1849-'51); *La renaissance des arts à la cour de France, études sur le 16<sup>e</sup> siècle* (8vo., 1851-'5); and *De l'union*

*des arts et de l'industrie* (2 vols. 8vo., 1856). After being for several years keeper of one of the departments at the Louvre, he was appointed in 1857 director of the archives of the empire.

LA BORDE, MAXIMILIAN, an American physician and scholar, born in Edgefield, S. C., in 1804. His father was a Frenchman from Bordeaux, and he himself is the sole survivor of the family. He entered the junior class of the South Carolina college, was graduated at the age of 16, studied law under George McDuffie, afterward abandoned the legal for the medical profession, and was graduated (1826) in the first class of the medical college of South Carolina, then recently established at Charleston. He practised his profession 18 years, during which period he sometimes represented the people of Edgefield district in the lower house of the state legislature, and edited the "Edgefield Advertiser" newspaper in 1836. In 1838 he was elected secretary of the state. He was then made one of the board of trustees of the South Carolina college, and in 1842 accepted the chair of logic and belles-lettres in that institution. In 1845 he was transferred to the chair of metaphysics, and at his suggestion physiology was made a part of the college curriculum. He taught chiefly by lecture till 1855, when he prepared and published a text book on physiology, which is highly esteemed. He has been a frequent contributor to the "Southern Quarterly Review" on a variety of abstruse and important subjects; and has contributed also to Russell's and other southern magazines. In Aug. 1859, he published an elaborate "History of the South Carolina College, with Sketches of its Presidents and Professors," embodying a large mass of interesting biographical matter.

LABOUCHERE, HENRY, Baron Taunton, an English statesman, born in London, Aug. 15, 1798. His father, Peter Cassar Labouchere, whose ancestors left France at the period of the revocation of the edict of Nantes and became established in Holland, was a partner of the banking house of Hope and co. of Amsterdam, and settled in England, where he married a daughter of Sir Francis Baring. The son was graduated at Oxford, and in 1826 entered parliament as member for the borough of St. Michael's. About the same time, in company with Mr. Stanley, now earl of Derby, and Mr. Denison, now speaker of the house of commons, he visited America, in order to study the operation of republican institutions. The result was to confirm him in his liberal opinions, and he has long been recognized as one of the most prominent leaders of the British liberal party. He continued to sit for St. Michael's until 1830, when he was returned for Taunton, retaining this position by successive re-elections until 1859, when he was raised to the peerage. In 1832 he was made one of the lords of the admiralty. He resigned in 1834, and in April, 1835, was appointed vice-president of the board of trade, master of the mint, and privy councillor. In March, 1839, he became under secre-

tary for the colonies, and a few months later president of the board of trade, retaining office until the whig party went out of power in 1841. On the change of ministry in 1846 he was made chief secretary for Ireland. From 1847 until the dissolution of the cabinet in 1852 he was again president of the board of trade, and from 1855 to 1858 secretary of state for the colonies. Mr. Labouchere has been twice married: on April 10, 1840, to his cousin, a daughter of Sir Thomas Baring, who died in 1850; and on July 13, 1852, to Lady Mary Matilda Georgiana Howard, a daughter of the 6th earl of Carlisle.

LABOULAYE, ÉDOUARD RENE LEFEBVRE, a French author, born in Paris, Jan. 18, 1811. He studied law, and published in 1839 a *Histoire du droit de propriété foncière en Europe depuis Constantin jusqu'à nos jours*. He has also written on the political and civil condition of women from the time of the Romans to the present day, and on various kindred subjects. He is engaged upon a "History of the United States," of which the 1st volume appeared in 1855. He has translated the works of Dr. Channing into French, and has written an elaborate essay on slavery in the United States. Among his more recent works are *Souvenirs d'un voyageur* (1857), and *Études sur la propriété littéraire en France et en Angleterre* (1858). He has been since 1849 professor of comparative legislation at the *Collège de France*.

LABOURDONNAIE, BERTRAND FRANÇOIS MAHÉ DE, a French naval officer, born in St. Malo, Feb. 11, 1699, died Sept. 9, 1753. He was governor of the isles of France and Bourbon, and conquered Madras, but was afterward detained for 3 years at the Bastille for having relinquished its possession to the English in consideration of 9,000,000 crowns. His life was written by his grandson, Bertrand François Mahé, a famous actor, who was born in 1795, and died in London in Feb. 1840.

LABRADOR, an extensive peninsula of British North America, on the Atlantic coast, comprising in its fullest sense all that territory which is bounded N. by Hudson's strait, E. by the Atlantic, S. E. by the strait of Belle Isle, separating it from Newfoundland, S. by the gulf of St. Lawrence and Canada, and W. by James's bay and Hudson's bay; being comprised between lat. 50° and 63° N., and long. 56° and 79° W.; area, 420,000 sq. m. The W. part of this territory belongs to the Hudson's bay company; the E., with an area of 170,000 sq. m., and a population of 5,000, is Labrador proper, under the jurisdiction of Newfoundland. The coasts are extremely rugged and forbidding. No considerable rivers empty off the Atlantic coast, but the North West or Meschickemau river flows S. E. into the strait of Belle Isle; the East Main or Stude, and Great and Little Whale rivers, run W. to Hudson's bay; and the Keenoganssee and Koksoak, after a N. and N. W. course, discharge into Hudson's strait. There are many lakes, formed chiefly by expansions of the rivers. The most important is Clear

Water lake, whose overflow is carried by a stream of the same name to Hudson's bay. The interior of the country is imperfectly known. Its general aspect is bleak and desolate. The highest mountains extend along the E. coast from lat. 54° to 59° N., their elevation nowhere exceeding 3,000 feet. Mount Thoresby near the coast is 2,780 feet high. The prevailing geological formation on the seaboard is granite, gneiss, or mica slate, above which in some places are beds of old red sandstone about 200 feet thick, and a stratum of secondary limestone. Toward the interior the secondary rocks disappear. Very little is known of the mineral resources of the country, but iron ore, limestone, granite, hornblende, lapis-ollaris, hematite, and the beautiful shining spar called Labradorite are found, the last being collected by the Esquimaux on the sea coast and the shores of the lakes. In the southern portion of the country a stunted growth of poplars, pines, birch, and willow is found, and grass clothes the valleys for a few weeks in summer. Little vegetation exists in the north excepting mosses and lichens. In some few favored spots the aspect is better. In lat. 58° 57' N., along the course and mouth of the river Kangerluksoak, the banks are well wooded, and various European plants flourish. In lat. 59° N., around Nullatarlok bay, the mountains are covered with timber. At L'Anse à Loup the soil is more suitable than elsewhere for cultivation. No description of grain will ripen, but potatoes, Dutch turnips, cabbages, and other hardy vegetables come to perfection. Much rain falls in summer near the sea. Sometimes on the coast the thermometer in July indicates 86°, but a short distance inland it is at all times more temperate. The winters are extremely cold, the temperature often falling 80° below the freezing point. From December to June the sea is frozen, while on land travelling becomes almost impossible. The mean temperature of the respective months at the missionary stations of Okkak (lat. 57° 30') and Nain (lat. 56° 30') is in January 1.55°, February 2.78°, March 7.88°, April 29.48°, May 27.24°, June 42.59°, July 50.91°, August 51.99°, September 44.71°, October 32.56°, November 24.45°, December 27.84°. The prevailing winds on the E. coast vary between W. S. W. and N. W. There is less fog than on the island of Newfoundland, and the strait of Belle Isle is never frozen. The aurora borealis is frequent and of extreme brilliancy. The rivers abound with salmon, and the lakes with pike, barbel, eels, trout, &c.; the wilds with reindeer, black and white bears, wolves, foxes, hares, mountain cats, martens, and otters, with a few ermines, porcupines, and beaver; the birds are white grouse, ptarmigan, spruce game, gray plover, a great variety of water fowl, the white-tailed eagle, and several varieties of hawks. Mosquitoes are as abundant as in more southern climates. Dogs and reindeer are the only domesticated animals, both being made use of as beasts of draught.—The natives of Labrador, consisting chiefly of Esquimaux,

subsist by hunting and fishing. Over 1,800 are professed converts to Christianity. They live in detached communities, their largest village, of 250 inhabitants, being at Inuvutok inlet, or Esquimaux bay, on the Atlantic. They bring to the traders a considerable amount of furs and oils, in exchange for coarse cloths, muskets, powder, and cutlery. Until recently, hostilities were continual between the natives of the coast and those of the hills, but the influence of the Moravian missionaries has done much to restore peace. The missionaries came from Greenland about a century since. Their chief stations are at Nain, Okkak, Hebron, and Hopedale, and their total number is 28. A ship annually arrives from London with supplies for them, in exchange for the articles of trade which they barter with the Esquimaux. The main wealth of Labrador is in its fisheries, in which about 800 British schooners with 20,000 persons, chiefly from Newfoundland, Nova Scotia, New Brunswick, and Canada, are each season engaged, in addition to 400 American schooners with about 6,000 men. Each man catches on an average 100 quintals of codfish; and the oil is in the proportion of 1 ton to 200 quintals. Herring and mackerel fisheries are carried on by the same persons. About half the product goes to American markets, the remainder chiefly to England, Lisbon, and the Mediterranean. The product of the salmon fisheries averages annually 30,000 tierces. A considerable number of persons who are left in charge of the property when the schooners sail in September, employ themselves in seal fishing. From 16,000 to 18,000 seals, producing about 850 tons of oil, may be estimated as the average annual product. Beside fish and oil, skins, furs, and feathers are exported. The total exports of Labrador have been estimated at \$2,500,000 annually, and the imports at \$600,000. A more recent estimate gives the total value at \$4,000,000. The government report of 1857 records an increased state of activity. A British revenue cruiser is stationed on the coast during the fishing season.—The European settlements of Labrador are mainly at Forteau and Bradore bays, L'Anse, and Le Blanc, all on the E. coast. The Portuguese styled the country *Terra Labrador*, or cultivable land, a misnomer equal to that of Greenland. Hudson explored part of the coast in 1610. About the middle of the last century a settlement was formed on the coast by Mr. Darby, an American, father of the actress and poetess Mrs. Robinson, for the twofold purpose of establishing a whaling station and civilizing the Esquimaux, whom he thought it would be possible to employ in industrial occupations. But soon after the formation of the settlement, the main body of the Indians made a descent upon it, murdering many of his people and sending the products of their toil adrift into the ocean. Mr. Darby had relied for maritime protection upon promises of persons in power in England, but those promises not having been kept his settlement was destroyed, his

benevolent projects frustrated, and his extensive undertaking brought to an unfortunate close.

LABRADORITE. See FELDSPAR.

LA BRUYERE, JEAN DE, a French moralist, born near Dourdan, Normandy, about 1644, died in Versailles, May 11, 1696. At the recommendation of Bossuet he was appointed teacher of history to the grandson of the great Condé, in whose service he remained for the rest of his life in a literary capacity and in the enjoyment of a pension of 1,000 crowns. He was admitted a member of the French academy in 1693, and left the reputation of a genial philosopher, whose happiness consisted in cultivating the best society and in reading the choicest books. His power of observation and his literary attainments are attested by his celebrated *Caractères*, founded upon the "Characters" of Theophrastus, which he translated into French and prefixed to his own. Hallam says that he incomparably surpassed his Greek model. "Many changes in the condition of society, the greater diversity of rank and occupation in modern Europe, the influence of woman over the other sex, as well as their own varieties of character and manners, the effects of religion, learning, chivalry, royalty, have given a range to this very pleasing department of moral literature which no ancient could have compassed." When La Bruyère showed his work in MS. to the preceptor of the duke of Maine, he was told that the book would have many readers and its author many enemies. The 1st edition appeared in the beginning of 1688. Voltaire says: "A style rapid, concise, and nervous, expression animated and picturesque, a use of language altogether new, without offending against the established rules, struck the public at first; and the allusions which are crowded almost in every page completed its success." Three editions were exhausted in the first year of its publication, and 6 more before the author's death. La Bruyère left also an unfinished work, published in 1699 under the title of *Dialogues posthumes sur le quisième*, and contained in an edition of the works of La Bruyère, La Rochefoucauld, and Vauvenargues (Paris, 1820). Many editions of La Bruyère's "Characters" were published after his death in Holland and France. The first complete edition based upon the original work was prepared by M. Walckenaër (Paris, Didot, 1845), followed by an improved edition by M. Destailleur (Paris, Jannet, 1855), and an edition by Gennequin the elder with illustrations (1858). The English translation by the poet Rowe (London, 1709) has been often reprinted. In Nov. 1857, the authorities of Versailles placed an inscription in front of the house in which he lived and died.

LABUAN, a British island in the Malay archipelago, on the N. W. coast of Borneo, in lat. 5° 22' N., long. 115° 10' E.; length 10 m., breadth 5 m.; pop. in 1855, 1,523, with a garrison of 173 soldiers. It has a good harbor. The entrances in 1855 numbered 333 and the clearances 17 vessels; the imports (cottons, &c.) amounted to £26,935, and the exports (sago,

coal, beeswax, &c.) to £7,940. The quantity of coal sold from the mines was 9,155 tons in 1853, but only 1,894 in 1855. The number of acres planted with cocoanuts, &c., up to 1857, was 116. The revenue in 1855 was £1,794, and the expenditures £3,416. The climate is bad, and dangerous fevers prevail. The island is divided into two districts, Labuan and Tanjong Kubong. An episcopal see was created there in 1855. The settlement of this island dates from 1846, when, through the influence of Sir James Brooke, the rajah of Sarawak, it was ceded to Great Britain by the sultan of Brunei.

**LABURNUM** (*cytiscus laburnum*, Linn.), a small, hardy, ornamental, deciduous tree of the lotus division of the leguminous order. The common laburnum was introduced from Switzerland into Great Britain near the close of the 16th century, and is now largely cultivated as an ornament to shrubberies, villas, and small gardens. In May and June it presents a beautiful appearance, every twig and small branch being hung with racemes of brilliant yellow flowers. Its wood is largely used for ornamental work, and for handles to knives and other instruments. It is hard, and so heavy that the branches sink in water. It takes a high polish, and has a greenish color. The French call it the ebony of the Alps. Rabbits are so fond of its bark, that they eat it in preference to that of any other trees. The seeds are highly poisonous, and their great profusion and brilliant appearance render it somewhat objectionable to cultivate the tree from the danger of children or cattle being tempted to eat them. The alpine or Scotch laburnum (*cytiscus alpinus*) attains a greater size than the other species, which are usually less than 8 feet in height.

**LABYRINTH**, a structure of intricate passage ways which it is impossible to traverse without a clue. Three labyrinths are mentioned in ancient story. The best authenticated is the labyrinth of Egypt, situated at Arsinoë, near Lake Moëris. Herodotus visited and describes it. It consisted of 3,000 chambers, half of them below ground, the subterranean apartments being sacred burial places. It was extant in Pliny's time. Ruins at the modern village of Howara in Fayoom have been recently identified by Dr. Lepsius with those of the labyrinth. Another structure, on a smaller scale but on the model of that of Egypt, was reported to have been built near Cnossus in Crete, by Dædalus, as a place of confinement for the fabled monster the Minotaur; but antiquaries discover nothing more labyrinthine in the locality indicated than the caves and quarries of Mount Ida. The 3d labyrinth was in the isle of Lemnos, but no remains of it have been traced. A similar structure was said to exist on the island of Samos, and another, called the labyrinthine tomb of Porsena, near Clusium, in Etruria.

**LABYRINTHODON** (Gr. *λαβυρινθος*, labyrinth, and *odon*, a tooth), a gigantic fossil reptile, so named by Prof. Owen from the complex labyrinthine structure of the teeth; the same an-

imal had been previously called *cheirotherium* by Kaup, from the resemblance of its tracks to impressions of the human hand. This animal, which possesses both saurian and batrachian characters, probably most nearly resembled a gigantic frog about 10 or 12 feet in length. A historical sketch of the discoveries in connection with this reptile may be found in the "Proceedings of the Boston Society of Natural History" (vol. v., 1856, p. 298), and full details on its affinities in the "Annals and Magazine of Natural History" (vol. viii., London, 1852, pp. 805-818). Footprints and bones of the labyrinthodon have been found in the trias of England and Germany; from an examination of the head and teeth, vertebrae, pelvis, and bones of the extremities, Prof. Owen has constructed an animal intermediate between the crocodile and the frog. Pictet (*Traité de paléontologie*, 1858) calls it *mastodonsaurus*, and considers it a saurian from the presence of scutes on the skin and the form of the teeth. The general shape of the head is frog-like, as also are the double occipital condyles, narrow palatal processes of the maxillary, the roof of the mouth, the row of small teeth across the anterior part of the palate and a longitudinal row on the palate concentric with the maxillary teeth, the lower jaw and the vertebrae, and bones of the fore limbs; on the other hand, the facial and nasal parts of the skull are crocodilian, as are the maxillary tusks, the strong transverse processes for ribs, bony dermal plates, &c. In some of the dental characters it resembles fishes. The size of the tracks varies from 4 to 12 inches in length, with 5 toes on each, one turned in like the human thumb; the hind foot was 8 or 4 times as large as the fore foot; there is no positive evidence that the animal had a tail; its progression seems to have been slow and awkward, the legs having been swung outward like the course of a scythe. Near each large step, and 1½ inches before it, is a smaller one of the fore foot, the distance from pair to pair being about 14 inches. The American cheirotherium made a double series of tracks, and evidently belonged to a different genus from that of Europe.

**LAC**, a resinous exudation from the twigs and branches of various kinds of trees in the East Indies, caused by the punctures of the insect *coccus lacca*, which swarms upon trees yielding a milky juice. The exuding juice forms an incrustation around the twigs, and in this the insects make the cells for containing their eggs. Upon the outside the concrete resinous lumps are marked with numerous pores as if perforated with a needle; within are seen many oblong cells, which often contain dead insects. The substance is of a deep reddish brown color, of shining fracture, and an astringent, bitterish taste. It colors the saliva beautifully red, and produces a dye of this color but little inferior to the real cochineal. Indeed, before the discovery of the latter it was the material of the fine rich crimson dye of the ancients, and of the durable reds of the dyers of Brussels and Holland. The

coloring matter is readily extracted by warm water; the lac itself is for the most part soluble in alcohol; when burned it diffuses a strong agreeable odor. The crude article broken off with the twigs is known as stick lac, and is sold by those who gather it at from 2 to 4 lbs. for a penny. When the stick lac is broken up and its coloring matter is partially removed by water, it is called from its granular appearance seed lac. This is sometimes melted into masses and called lump lac. The more familiar variety known as shell lac is prepared by melting the seed lac and straining it through fine linen bags, upon a flat, smooth surface of wood, to harden. It dries in thin sheets, which break up into small fragments. Their color is from orange to dark reddish brown; they are more or less transparent, hard, and brittle, and of shining lustre. The substance is soluble in alcohol, but not in water, and possesses neither taste nor smell. It softens readily by heat, so that it has run together in masses when stowed in the hold of a ship. It contains, as found by Hatchett, 90.9 per cent. of resin and 0.5 of coloring matter; the remainder is wax, gluten, and foreign matter. Stick lac contains about 10 per cent. of coloring matter and 68 per cent. of resin. The coloring matter is separated by treatment with warm water and evaporation, and, made into square cakes, is known as lac dye, lac lake, or cake lake. When scraped they yield a bright red powder like carmine. A varnish and pigment combined is prepared from stick lac for the process of jappanning. The natives of India employ the substance in various ways. They color it with yellow orpiment and make it into bracelets, chains, and other ornaments in imitation of gold. They prepare with it a good varnish, which they color with cinnabar or some other pigment. The wheels of their lapidaries are covered with a preparation of lac, which serves by its adhesive nature to retain the polishing powders. The chief uses of shell lac are for manufacturing sealing wax, and as the basis for spirit varnishes and the French polish. The best red sealing wax contains 48 parts in 100 of it, together with 19 parts of Venice turpentine, 1 of balsam of Peru, and 82 of finely powdered cinnabar. It forms 60 per cent. of the best black sealing wax, the other ingredients being 10 parts of turpentine and 80 of levigated bone black. The coloring matter and some insoluble ingredients, which are never wholly removed from shell lac, injure it for a varnish for light colored works; but recent methods of bleaching, one of which by chlorine was introduced by Dr. Hare, have in a great measure removed this difficulty. (See VARNISH.) The adhesive quality of lac renders it a useful material for cements for broken porcelain, and united with caoutchouc it makes the famous marine glue. A weak solution of it in alcohol is recommended in surgery to be spread on bandages for dressing wounds and ulcers. Formerly it was used in medicine, but it has no specific action.—The best stick lac is brought from Siam,

and next to this ranks that from Assam. In the best articles the sticks are frequently incrustated entirely around with the lac to the thickness of a quarter of an inch; and the substance also forms large oblong bunches of much greater thickness. The Bengal stick lac is commonly in very scanty and irregular incrustations. The capacity of production is said to be many times greater than the demand, though the annual exportations amount to several million lbs. of lac dye and shell lac. The stock on hand in 1854 consisted, according to a paper of Gen. Briggs presented to the English Asiatic society, of 8,800,280 lbs. of lac dye, and 2,858,750 lbs. of shell lac.

LA CAILLE, NICOLAS LOUIS DE, a French astronomer, born at Rumigny, near Rheims, March 15, 1718, died in Paris, March 21, 1762. He was a pupil of Cassini in the observatory of Paris, assisted Maraldi in the survey of the coast between Nantes and Bayonne, and afterward (1739-40) took part in the measurement of the arc of the meridian, correcting the results of Picard, and proving the flattening of the earth toward the poles. Being now appointed professor of mathematics in the Mazarin college, he published (1741-'50) lectures on mathematics, mechanics, astronomy, and optics, which have passed through many editions. He next devoted himself to astronomical observations, both at his observatory and at the Cape of Good Hope. His catalogue of stars made at the latter station excited especial surprise from the quickness and accuracy of its formation. By simultaneous observations made by himself at the Cape and by Lalande at Berlin, he established the distance of the moon and of the planets Mars and Venus. While there he received orders to survey the islands of Bourbon and Mauritius. On his return he investigated anew the problem of finding the longitude at sea, and proposed the modern plan of a nautical almanac. In 1757 he published his *Astronomie Fundamenta*; the next year, tables of the sun; and soon after, Bouguer's treatise *De la gradation de la lumière*, and a new edition of a treatise on navigation by the same author. After his death his friend Maraldi published his treatise on the "Southern Starry Heavens," and his "Voyage to the Cape."

LAOANDONES, an unsubdued Indian nation, occupying the upper waters of the river Usumasinta, in Central America. Their territory, which embraces a considerable portion of Guatemala, Chiapas, and Tabasco, is a wild, mountainous region, and has never been explored. For two centuries after the conquest, the Lacandones were aggressive and cruel in their habits, and gave great trouble to the adjacent Spanish provinces; but for the last century they seem to have sought seclusion, and carefully avoided contact with the Spaniards as well as with the civilized Indians around them. During the 17th century their numbers were much augmented by the remnants of the Oholes, Itzaes, and Manches, driven out of the provinces of Peten

and Vera Paz. In 1887 the Manches made a treaty with the then existing republic of Central America, which provided that after 7 years they should be under the sovereignty of the republic, and that then there should be no change in their religion, nor interference with their practice of polygamy. Although anciently regarded as the fiercest and most barbarous of all the aboriginal families of Central America, the Lacandones are now described as shy and almost timid. A few occasionally enter the frontier towns of Chiapas, Tabasco, and Guatemala, with a little tobacco or sarsaparilla; but no sooner have they disposed of it than they disappear suddenly by obscure and unknown paths. Their language is a dialect of the Maya of Yucatan, and closely resembles the Quiché and Kachiquil. Waldeck describes their dress as coinciding with the garbs represented on the monuments of Palenque. Their actual worship is unknown, although it is well understood that they have their hidden temples where they practise the rites of their ancestors. Their government is equally unknown, but probably is nearly the same as before the conquest. There is however no reason for believing that they have in their fastnesses large cities and towns, with great temples glistening like silver in the sun, such as the cura of Quiché affirmed to Mr. Stephens that he had seen with his own eyes from the tops of the mountains of Quesaltenango.

LACCADIVE ISLES (called by the natives *Lakaradeesh*, *deesh* signifying "island"), a group of small islands in the Indian ocean, consisting of 20 clusters, 100 m. off the Malabar coast, between lat. 10° and 13° 40' N. and long. 73° and 74° E.; pop. about 10,000. They are all of coral formation. The largest is but 7 miles in length, and many of them are barren uninhabited rocks. From the dangerous reefs around them they are seldom visited by navigators. The harbor most frequently called at for supplies is Kan-Rattea, lat. 10° 34' N., long. 73° 56' E. The islands are not fertile, excepting in cocoa palms, the fruit of which forms the principal food of the inhabitants, and its fibre or coir one of the chief articles of commerce. The natives are an inoffensive race, of Arabian origin, who profess a kind of Mohammedanism, and are called Moplays. Their dwellings are of stone and roofed with thatch. The islands are dependencies of British India; the principal are Underoot, Cabarita Akhalu, Kalpeni, Kaltair, Oheltac, Kerdmur, Ameni, Corrittee, and Minicooy. The Laccadives were discovered by Vasco da Gama in 1499. In April, 1847, the sea broke over Kalpeni, Underoot, and other islands, filled the wells with salt water, and uprooted the trees; and 1,800 of the inhabitants perished by drowning or famine.

LACE, a fabric of threads of cotton, linen, silk, gold, or silver, interwoven to form a delicate net-work. It was in use in Venice at an early period, and it is supposed that it was known to the ancient Greeks and Romans. Its

importation into England was prohibited in 1488, in order that the domestic manufacture should be protected; but the lace was probably coarse, as pins, which are essential for the manufacture of the finer qualities, were not made until near the middle of the next century. The trade prospered during the 17th century especially in Buckinghamshire; and in 1880, as appears by a petition presented to Queen Adelaide, there were 120,000 persons dependent upon it in that county and its vicinity. The kind called pillow, thread, or bone lace, which they manufactured by hand, was, however, already in great measure supplanted by the bobbinet machine-made lace. Other parts of Great Britain are famous for the manufacture of other qualities of lace. A recent English writer says: "Honiton lace came into fashion in 1842, and owes its present position to Queen Victoria. Commiserating the miserable condition of the lace-workers of Devon, she determined to assist them by bringing their manufacture into fashion, and in furtherance of this laudable purpose had her wedding dress made of it. Honiton at once became the rage, and has continued popular and expensive ever since, although previously purchasers could hardly be found for it." Its manufacture employed in 1851 from 7,000 to 8,000 persons in a district including Honiton and extending 30 miles along the coast of Devonshire and 12 miles inland. Some of the highly ornamented dress articles of this lace were valued at 200 guineas each. Nottingham at the same time was the seat of the bobbinet manufacture, which employed 138,015 persons, 8,200 machines, and a capital in the various departments of the trade of £2,965,945. The annual business returns amounted to £2,800,000. Limerick lace is made only in Ireland; British point lace chiefly in the vicinity of London; and tambour lace at Islington, Coggleshall in Essex, and Nottingham. Chantilly lace is always black; it is exceedingly fine, and is much used for veils and flounces. The names of many of the varieties point to other countries also as engaged in the manufacture. Thus the famous Brussels, Mechlin, Valenciennes, and Grammont laces are of Belgian production. More and finer laces are imported into Great Britain from Belgium than from all other countries in Europe together. Switzerland also furnishes supplies superior in quality to the French; but they pass in commerce as French. Of the Belgian laces named above, one variety classed with the Brussels, and known as the *point à l'aiguille*, is made entirely with the needle. The Mechlin laces are made at Mechlin, Antwerp, and other places. The mesh in these laces is of hexagonal form, and the pattern is worked in the net. Mechlin was formerly the highest prized among laces; but the *point de Venise antique* now ranks above it in value. "It is a rare old lace, light and open, raised in some parts like embossed work, and has an air of antiquity that is highly prized. The manufacture of it is said to be entirely abandoned,

and it is only found now as heirlooms in families, except when a stray specimen finds its way into market, in which case there is a great competition for its possession. The *point de Venise antique* is seen more frequently in Italy than in any other country, for the high dignitaries of the Catholic church have their official robes trimmed with flounces of this costly material. It finds its way into England chiefly through the medium of travellers, who seize upon every opportunity to obtain these relics of ancient fashion." Valenciennes laces are made in and around Ypres, Menin, Courtrai, Bruges, Ghent, and Alost. It is remarked of these districts, as also of those in France engaged in the manufacture, that each one has its own peculiar style, which serves to identify its production, though no difference may be perceived in the process or materials. In France the manufacture is more extensively carried on than elsewhere; and it is supposed that more than 200,000 females are there employed in making lace by hand. Caen, Bayeux, Chantilly, Lille, Arras, Mirecourt, Puy, Bailleul, and Alençon are all noted for the manufacture. The lace called *point d'Alençon* is the only variety made with pure linen hand-spun thread and worked with a needle; the value of the thread alone is from \$500 to \$600 per lb. The meshes of this lace are alternately square and octagonal. The Alençon or blond lace has a hexagonal mesh. *Point d'Alençon* is prized next to the *point de Venise antique*. It has a dingy appearance, and strikes the unsophisticated with the idea that it needs washing. *Point de gaze* is a variety of lace as fine as a spider's web and as light as thistle down. At Bayeux are made the whitest and cheapest varieties of lace, and together with Caen more piece goods, as shawls, mantles, &c., than are made in any other part of the world; at Mirecourt, Lille, and Arras, the clear foundation and *fonds de champs*, in white thread, and also a lace called *guipure*, resembling the Honiton. Silk blond was first made at Caen, and was so named from its original nankeen color. It is now made of the finest white or black silk.—The intricacies of lace weaving render it hopeless to attempt to convey a clear idea either of the processes, the peculiarities of the different fabrics, or of the machines employed, by any mere description. Dr. Ure remarks: "Bobbinet may be said to surpass every other branch of human industry in the complex ingenuity of its machinery; one of Fisher's spotting frames being as much beyond the most curious chronometer, in multiplicity of mechanical device, as that is beyond a common roasting jack." The oldest kind of lace, such as is seen in the portraits of the time of Charles I., is known as the Brussels point, the net-work of which was made by using bone bobbins (whence its name of bone lace), and the pattern worked with the needle. A hard stuffed pillow or cushion was employed (hence sometimes called pillow lace), covered with parchment, and on this the pattern was drawn.

Pins were stuck into the pillow, according to the pattern, and around these the threads were woven or twisted. By the introduction of a thicker thread, called gimp, the appearance of flowers and ornamental designs was produced. The thread was wound upon bobbins, and each pair of these was attached together on beginning the work, and the thread fastened to one of the pins. The sides of the mesh were formed by twisting 3 times over each other the threads of two pairs of bobbins, one pair being held in each hand. The threads of the adjacent bobbins were next crossed to form the bottom of the mesh; and the work thus went on, each portion of the mesh requiring its own routine of thread crossings, and being secured by pins as soon as completed. From 48 to 60 bobbins are required for every inch of breadth, and only one mesh is made at a time. Since the introduction of machinery for producing the net-work, ornamental patterns made by hand are sewed to it. In this way are produced the most beautiful fabrics of Honiton lace. "Brussels *point appliqué* is formed by sewing sprigs of the real point upon illusion or any other kind of plain lace. It is very much used for flounces, and costs from £6 to £8 per yard,  $\frac{1}{2}$  wide. It is very pure in color, which is owing to a white powder with which it is saturated, and which it continues to retain, and obviates the necessity of washing." The first attempts to apply machinery to the work were made in 1768 by a stocking weaver of Nottingham, and his machine, which was called a pin machine, making single press point net in imitation of Brussels ground, is said to be still in use in France for making the variety known as *tulle*. The stocking weavers of Nottingham invented other machines, the first for bobbinet in 1799; and though they were all inferior, they made lace more cheaply than by the old methods, and caused Nottingham to become the centre of the trade. But the first really successful machine for bobbinet (so named from the threads crossing the warp being supplied from bobbins) was that of Heathcoat, invented in 1809, and suggested by the machinery employed in making fishing nets. The principle of the invention was in the use of fixed parallel warp threads, round which the bobbin threads were worked as the weft of the fabric, one set going obliquely across from right to left and the second set obliquely across from left to right. Mr. Heathcoat was compelled by the opposition his machine excited to remove from Nottingham to Devonshire, and it was not until the expiration of his patent in 1823 that the machines were introduced in the former place. In the machine the warp threads, to the number of 700 to 1,200 in a yard of width, are stretched from a roller; which extends the whole length of the thread beam, and the weft threads are wound each upon a bobbin formed of two thin brass disks, riveted together, leaving a narrow space between them for the thread. Each bobbin holds about 100 yards of thread, and there

are as many as 1,200 of them to a machine. The arrangement and movement of these in the machine can be understood only by careful inspection and study of the machine itself. The pieces of bobbinet measure from 20 to 30 yards each; the width is variable. The narrowest strips—even the narrow quillings used for cap borders—are made on the same machine, many breadths together, which are temporarily united by threads that are finally drawn out. There are special machines called warp machines, of great variety, for making the sorts of lace known as warp lace; and there are others called point net for making this quality. A Jacquard apparatus is attached to some of the machines for working in the thick thread of gimp for the ornamental figures. Where the thread passes from one figure to another, it is clipped off by children, who use the scissors for this purpose with great dexterity. The patterns at many of the factories are worked in by hand. The government school of design established at Nottingham has served to educate many skilful designers, who prepare the patterns upon wood or stone as for engraving or printing, those parts intended to leave a mark being in relief. The block, being moistened with some colored pigment, is repeatedly impressed upon the net, until the pattern is transferred to the whole surface designed for it; and the figure is then worked with the needle, the web being extended horizontally in a frame. Before being embroidered the net is carefully examined, and the defective parts are skilfully repaired by a class of workwomen called lace menders. It is also singed by drawing it rapidly over the flame of gas lights. Bleaching and dyeing are final processes, preceding those belonging to calendering. "The labor of washing lace is almost an art; and only the most skilful are engaged in it. After washing, lace is spread out to dry on a cushioned table, and pins of a peculiar sort are run through each hole to prevent it from shrinking. When very fine, or the pattern intricate, an entire day will be spent upon one yard of lace." By means of the application of machinery to lace making, the price of the fabric has been wonderfully reduced; so that, as Dr. Ure states, a rack of lace, equal to 240 meshes in the length, which in the early part of the present century cost to manufacture 8s. 6d., now costs not more than one penny; and a 24 rack piece, 5 quarters broad, formerly worth £17, is now sold for 7s.—The imports of lace into the United States in the year ending June 30, 1859, amounted to nearly \$4,200,000, about \$500,000 more than in the preceding year.

LACEDÆMON. See SPARTA.

LACÉPÈDE, BERNARD GERMAIN ÉTIENNE DE LA VILLE, comte de, a French naturalist, born in Agen, Dec. 26, 1756, died at his country seat near St. Denis, Oct. 6, 1825. He early evinced a taste for natural philosophy and musical composition, and was encouraged by Buffon, to whom he had submitted some papers on cer-

tain new philosophical experiments. Repairing to Paris when 20 years old, he was welcomed by Buffon and by the composer Gluck. He followed his twofold vocation, giving to music the time which was not devoted to natural philosophy; he composed several operas, one of which was on the eve of being performed when the rehearsals were interrupted by a whim of a popular actress. He bore this disappointment patiently, and contented himself with publishing his *Poétique de la musique* (2 vols. 8vo., Paris, 1785), in which Gluck's principles are expounded. He had previously written an *Essai sur l'électricité naturelle et artificielle* (2 vols. 8vo., 1781), and *Physique générale et particulière* (2 vols. 12mo., 1782-'4), which were not well received by men of science, and which he himself afterward tried to suppress; but they had such merits of style that Buffon engaged him as an assistant in continuing his "Natural History," and appointed him keeper and assistant demonstrator at the museum. He vindicated his claims to such distinction by presenting to the scientific world his *Histoire des quadrupèdes ovipares et des serpents* (2 vols. 4to., 1788-'9), and his *Histoire naturelle des reptiles* (4to., 1789), which have been frequently reprinted as sequels to Buffon's work. He favored the revolution, was invested with several offices of trust, and elected in 1791 to the legislative assembly, over which he presided toward the end of the same year. He was offered the post of governor to the dauphin, but refused it. On the massacres of September, he so energetically expostulated with Danton, that his friends, anxious for his safety, removed him from Paris, and persuaded him to resign his office at the museum. He did not return to the capital until after the 9th Thermidor. Being regarded as the legitimate heir of Buffon, he took his seat among the original members of the institute on its foundation, and was about the same time appointed to the newly created professorship of herpetology in the *jardin des plantes*. In 1798-1803 he published his *Histoire naturelle des poissons* in 6 vols. 4to. and in 11 vols. 12mo., and in 1804 his *Histoire des cétacés* in 4to. and in 2 vols. 12mo., which display great descriptive talent. On the organization of the consular government, he had been made a member of the senate, in 1801 president of that body, in 1803 grand chancellor of the legion of honor, and soon afterward he became minister of state. His frequent official addresses to the emperor were too often spoiled by adulation. In his capacity of president of the senate he presented in 1809 the report upon the divorce of Napoleon and Josephine. A wise, but not an influential adviser, he could do nothing to prevent the fall of the empire, to which he had become sincerely attached; he submitted to the Bourbons on their first return, joined Napoleon during the Hundred Days, and, though coldly treated on the second restoration, reentered the chamber of peers in 1819. He died of the small pox. Beside the works mentioned above, he is the au-

thor of several papers printed in the *Mémoires* of the institute, and, jointly with George Olivier and Geoffroy St. Hilaire, of *La ménagerie du muséum national d'histoire naturelle* (1801), a descriptive history of the animals in the *jardin des plantes*. He devoted the last months of his life to correcting the notes of the *Histoire générale, physique et civile de l'Europe, depuis les dernières années du 5<sup>e</sup> siècle jusqu'à vers le milieu du 18<sup>e</sup>*, which appeared after his death (18 vols. 8vo., 1826), and attracted very little if any attention. To this must be added two other posthumous works: *Histoire naturelle de l'homme* (8vo., 1827), and *Les âges de la nature et l'histoire de l'espèce humaine* (3 vols. 8vo., 1830). Under the title of *Œuvres de M. le comte de Lacépède*, his principal productions, viz., his discourses and natural histories of cetaceous and oviparous animals, snakes, and fishes, were collected in 11 vols. 8vo., 1826, and reprinted in 1831-3, 1836, and 1840.

LA CERDA, the name of an ancient Spanish family, which traced its origin to Ferdinand the eldest son of Alfonso X. of Castile, called La Cerdá, or the horse's mane, by reason of a large tuft of hair which grew upon his shoulders. In 1269, at the age of 15 years, this prince was married to Blanche, daughter of St. Louis of France. Philip the Bold, brother of Blanche, Edward, heir to the throne of England, and the king of Granada, were present at this marriage. Ferdinand died in 1275, leaving 2 sons, Alfonso and Ferdinand, heirs to the crown. Sancho, 2d son of Alfonso X., however, claimed the succession, and caused himself to be proclaimed in his father's lifetime. Yolande, the wife of Alfonso, fled from Castile with her grandchildren, to find a protector for them in her brother Don Pedro, king of Aragon, or in their uncle Philip the Bold of France. After some hesitation these kings resolved that the young princes should remain prisoners in Aragon, and Yolande, after fruitless efforts to change their purpose, was obliged to return to Castile alone. Blanche, the mother of the princes, wandered through France and Aragon, vainly exclaiming against the injustice of this decision. Alfonso X. died in 1284, and in his will made Alfonso and Ferdinand de la Cerdá his heirs, and even in their default excluded from the throne that son by whom the latter years of his life had been embittered. So sweeping a disinheritance was however regarded as of little force, and caused slight hesitation between the unfortunate children, who for many long years had languished in a fortress of Aragon, and Sancho, already in possession of the throne, and whose victories over the Moors had just given him the surnames of the Strong and the Valiant. At length, when it became the interest of the king of Aragon to embarrass the king of Castile, he set the princes of La Cerdá at liberty. They were proclaimed at Badajoz and Talavera; but being unable to maintain themselves in Castile, they passed into France in the reign of Philip the Fair. They received from him but slight assistance, and their

military operations on the frontiers of Castile were unfortunate. Sancho had died and had been succeeded by his own son. The kings of Portugal and Aragon, being now invited to act as mediators between the ruling and the proscribed branches of the family, gave a decisive sentence in favor of the former, stipulating only that three cities should be ceded to Alfonso to aid him in maintaining the dignity of his birth. Alfonso at first refused, but afterward, deserted by all his defenders, he accepted the terms, and from this time received the surname of the Disinherited. He died in 1325, leaving two sons. One of these, Charles de la Cerdá, called also Charles of Spain, was appointed by King John in 1350 constable of France. But the French court was soon disturbed by a rivalry between Charles of Spain and Charles the Bad, king of Navarre; and in 1354, while on a visit to his young wife in the castle of L'Aigle in Normandy, the former was poniarded by assassins in the interest and under the eye of the king of Navarre. In 1425 the house of La Cerdá became extinct.

LACERDA, FRANCISCO JOZÉ DE, a Portuguese traveller, born in the early part of the 18th century, died in Africa about the beginning of the 19th. A military man by profession, and an excellent engineer, he was employed by his government in marking the boundary line between the Portuguese and Spanish possessions in Brazil. His travels in that country were published in 1842 in the journal of the Rio de Janeiro historical society. In 1797 he was placed at the head of a government expedition from Tete, capital of a government of the Portuguese territory in E. Africa, whence he set out for Ouzembé. He reached Lunda, the capital, at the end of 1798, and was well received by Laqueza, the king, but died not long after his departure from that city. His body was about to be removed to Tete by order of the king, when those charged with its transmission were attacked by highwaymen and compelled to leave it unburied in the desert. The scientific remains of the expedition, however, were saved by Lacerda's nephew, who had formed part of it. Monteiro and Gamitto, who in 1831 set out on a new expedition, frequently refer to Lacerda's labors. His MSS., however, are still unpublished in the Lisbon academy of sciences, while Gamitto's narrative of his explorations was published in Lisbon in 1854 (*O Muata Cazembe, &c.*).

LA CHAISE D'AIX, FRANÇOIS DE, a French Jesuit, for 34 years confessor of Louis XIV., born at the chateau of Aix, Forez, Aug. 25, 1624, died Jan. 20, 1709. He taught philosophy and theology with brilliant success at Lyons, was afterward rector at Grenoble and provincial of his order at Lyons, and in 1675 succeeded Ferrier as confessor of the king. He maintained his position amid the difficulties between Mme. de Montespan and the queen, Mme. de Montespan and Mme. de Maintenon, the Jesuits and the Jansenists, Bossuet and Fénelon, and the courts of Rome and of France. He promoted the revocation of the edict of Nantes

(1685), but exerted a conciliatory influence with respect to Fénelon, Quesnel, and the Jansenists. Louis XIV. built for him a country seat called Mont Louis, the gardens of which are now transformed into the cemetery named Père la Chaise.

**LACHES** (law Fr. *lachesse*, idleness). The law shows no favor to either tardy or negligent suitors. *Vigilantibus non dormientibus jura subveniunt*, the laws assist those who are vigilant, not those who sleep upon their rights. In this spirit are framed statutes of limitation. (See **LIMITATION**.) So, too, in respect to the production of evidence: testimony discovered after a trial may be heard by the court, if it be material to the case adjudged; but if, by the exercise of a proper diligence, the evidence might have been offered at the trial, its non-production is attributed to the party's neglect or laches, and from the consequences of that the court will not willingly relieve him. The word laches remains a familiar one in the law of negotiable paper (which see). The same principles of diligence and laches are found in equity practice. The negligence of a party in bringing suit or doing some other act required of him in order to become entitled to redress is laches, which the court of equity will discountenance. In the language of Baron Alderson: "Nothing will call the court's jurisdiction into exercise but conscience, good faith, and reasonable diligence. When these fail, the court will remain passive." For example, one who claims specific performance of an agreement must show that he has been in no default in the premises, but that he has taken all proper measures to secure performance; for if he has been guilty of laches his bill for relief will be dismissed. Yet his negligence must clearly appear; thus, that a party has rested upon an equitable title will not be imputed to him as laches, when he seeks performance of an agreement to convey the legal title. But, *nullum tempus occurrit regi*, lapse of time does not bar the rights of the crown; in other words, no laches can be imputed to the sovereign, whether crown or state. It was upon this principle that formerly in England the civil claims of the crown were not prejudiced by lapse of time; and criminal prosecutions, which are always brought in the sovereign's name, might be commenced at any distance of time after the commission of the offence. These rules have been indeed somewhat modified by statutes, but the principle still remains, as well in the United States as in England.

**LAOHMANN, KARL**, a German philologist, born in Brunswick, March 4, 1793, died in Berlin, March 18, 1851. He was educated at the universities of Leipzig and Göttingen, and in 1811 founded in the latter city, in conjunction with Dissen, Schulze, and Bunsen, a critical and philological society. During the war after Napoleon's return from Elba, he served as a volunteer in the Prussian army. In 1816 he was successively appointed preceptor at the gymnasium and professor at the university of Königsberg, and in 1827 became a professor in

that of Berlin. This office he retained till his death. His essays on the *Nibelungenlied* and on Homer are the best known of his productions.

**LACHRYMÆ CHRISTI**, a celebrated wine of Naples, made in small quantity, and mostly reserved for the royal cellars. This wine, when pure and new, contains 19.7 per cent. of alcohol, of the specific gravity of .825 at 60° by measure; pure Château Margaux having 8.9, and brandy 58.89.

**LACHRYMATORIES**, small vials found in the sepulchres of the Greeks and Romans, and so denominated because they were supposed to contain the tears of the friends of the departed. These vials were made of glass or earthenware, with a long neck, and mouth shaped to receive the eye-ball. Notwithstanding the popular opinion with regard to their use, the probability is that they held certain aromatic substances.

**LACKAWANNA**, the name of a river and coal basin in Luzerne co., Penn. The stream rises in several small branches in the N. E. corner of the state, and flowing S. enters the N. E. extremity of the northern anthracite coal field, along which it continues past Carbondale, Jessup, and Scranton, nearly 80 m., to the N. branch of the Susquehanna, which it enters at Pittston. The course of the N. branch thence continues in the same coal field past Wyoming and Wilkesbarre to its S. W. extremity, about 20 m. further. This coal field is of narrow ellipsoidal form, slightly crescent-shaped, stretching in a N. E. and S. W. direction, and not attaining in its widest central portion a greater breadth than 5 m. (See map in article **ANTHRACITE**.) On each side the valley is shut in by mountain belts of the devonian strata, from the summits of which fine views are afforded of the fertile valley, its thriving towns and industrial operations. The western or Wyoming portion of the basin is traversed by the N. branch canal, and also by the Lackawanna and Bloomsburg railroad, which is extended further up the basin, connecting at Scranton with the Delaware, Lackawanna, and western railroad, which here traverses the coal field, and affords to its products an outlet southward through New Jersey to New York city, and northward to the Erie railroad. Other railroads also are in operation and laid out through the valley; and from its northern portion at Archbald the Delaware and Hudson canal company have two roads connecting with the canal at Honesdale, whence enormous supplies of anthracite have been for many years transported down the valley of Lackawaxen creek to the Delaware river, and thence to the outlet of the canal at Rondout on the Hudson. This coal field, being the nearest to New York, supplies a large portion of the anthracite consumed in that state and further east; and its importance compared with the other anthracite coal fields may be seen by reference to the article **ANTHRACITE**. The greatest thickness of strata belonging to the coal measures amounts in the central portion of the basin to nearly 1,800 feet. On each side they dip toward the central axis at angles sometimes

exceeding 30°, gradually lessening till they are found in horizontal and undulating positions near the centre. Toward each extremity of the basin they gradually shelve upward till replaced by the outcrop of the older rocks. The basin is remarkable for the large number of beds concentrated in a moderate thickness of coal measures. Thus at Solomon's Gap as many as 18 beds, varying from 1 foot to 19 feet in thickness, are found in 900 or 1,000 feet of strata, making a total thickness of coal of about 84 feet, or of workable beds 45 or 50 feet. The coal beds vary greatly in thickness as traced a few miles E. or W., some running together and producing immense bodies of coal, and again splitting into new beds of diminished thickness. This causes great uncertainty in tracing and identifying the several beds, and in estimating the value of any portions of the basin not explored by mining shafts. The lower coal measures produce some iron ores, which, together with ores obtained from the red shale formation, are employed by blast furnaces in the valley, the most important of which are at Scranton.

LA CLEDE (formerly Kinderhook), a S. co. of Mo., drained by Gasconade river; area, 710 sq. m.; pop. in 1856, 4,559, of whom 228 were slaves. It has a rolling surface, in some places well timbered, in others occupied by prairies. The soil is fertile, and the productions in 1850 were 136,829 bushels of Indian corn, 9,601 of wheat, 18,672 of oats, 6,420 lbs. of wool, and 30,975 of butter. Capital, Lebanon.

LAOLOS, PIERRE AMBROISE FRANÇOIS CHODERLOS DE, a French writer and soldier, born in Amiens in 1741, died in Taranto, Nov. 5, 1803. He entered the army at the age of 18, and reached the rank of captain in the corps of engineers in 1778. In 1782 he published a licentious novel, *Les liaisons dangereuses*, which nearly vied in point of popularity with Louvet's celebrated *Faublas*. A few years later he became secretary to the duke of Orleans, and thenceforth mingled with extraordinary activity in all the intrigues which aimed at the overthrow of Louis XVI. with the view of placing his own master on the throne. He figured among the most ardent revolutionists, became a prominent member of the *société des amis de la constitution*, afterward the "Jacobins," conducted their journal, and was the first to call for the deposition of the king after his flight to the frontier. In concert with Brissot, he wrote the petition for the same object which was to be signed at the Champ de Mars, July 14, 1791, and brought about the massacre with which Lafayette and Bailly were so bitterly reproached. For a time he served in Marshal Luckner's army in the north, and was promoted to the rank of brigadier-general, Sept. 22, 1792. The next year, sharing the fate of the duke of Orleans, he was incarcerated, but was liberated on the 9th Thermidor. After commanding the artillery in the army of the Rhine, he was sent in the capacity of inspector-general to the army in southern Italy, where he died.

LA CONDAMINE, CHARLES MARIE DE, a French mathematician and geographer, born in Paris, Jan. 28, 1701, died there, Feb. 4, 1774. He was educated at the university of his native city, and entering the army, served with distinction at the siege of Rosas. He soon, however, abandoned the military profession, and joined an expedition which was proceeding to the Mediterranean to explore the coasts of Asia and Africa. During his absence he visited Troas, Cyprus, Jerusalem, and Constantinople. In 1735 the academy of sciences sent him with Bouguer and others to Peru, to measure an arc of the meridian, for the purpose of more accurately determining the dimensions and figure of the earth. He returned to France in 1743, and prepared accounts of the voyage, travels, and labors of the commission. His "Voyage up the Amazon," and "Travels in South America," appeared in 1745, and "The Figure of the Earth as determined by the Observations of MM. de la Condamine and Bouguer" in 1749. In 1748 he was made a fellow of the royal society of London, and in 1760 a member of the academy of sciences in Paris. He labored to promote in France the practice of inoculation for small pox which was then followed in England. He left a number of treatises on geography, natural history, and physics, and in his day had some reputation as a writer of verses. The discovery by which he is best known is that the deflection of a plumb line by a mountain is large enough to be measured.

LACONIA, or LACONICA, in ancient geography, the southernmost division of Peloponnesus, bounded N. by Arcadia and Argolis, E. by the Argolian gulf and the Myrtoan sea, S. by the Laconian gulf, S. W. by the Messenian gulf, and W. by Messenia. Its principal mountain ranges were the Taygetus and the Parnok, the former spreading from the confines of Arcadia to the promontory of Tænarus, now Cape Matapan. Another principal promontory was Malea, now Cape Malio. The principal river was the Eurotas, on the banks of which stood the capital, Sparta or Lacedæmon; it emptied into the Laconian gulf. The coast had a considerable number of seaports and good harbors, among others the port of Epidaurus. Other renowned towns were Amyclæ, in a fertile region S. of Sparta, and Helos, on the Laconian gulf, which is supposed to have given the name to the slave population of the country. The coasts yielded a shell fish used for purple dye. The soil in general was fertile, well watered, and especially good for pasture, but, on account of the numerous mountains and hills, not well adapted for agriculture. The country was rich in game. The history of Laconia concentrates in that of its capital, Sparta.

LACORDAIRE, JEAN BAPTISTE HENRI, a French Catholic divine, born in Recey-sur-Ource, Côte d'Or, March 12, 1802. He was educated at Dijon, followed the prevailing reactionary impulse that was animating young men against the tendencies of the restoration, distin-

guished himself alike by the earnestness of his liberal opinions and by a peculiar obstinacy of character, and was graduated in 1819 with the highest university honors. He completed the legal course at Dijon, and continued to attract notice by his intellectual power and anti-Catholic enthusiasm, especially as an orator in the literary societies. In 1821 he went to Paris, and for 18 months was employed with an advocate at the court of cassation. Suddenly he abandoned the bar to enter the seminary of Saint Sulpice as a student of theology. He explains this change by saying that the soul of a young man "demands only a great cause to serve with great devotion." His social theories, doubtless, prepared his return to the Catholic faith, his aim being to revive society by the instrumentality of religion and the church. While in the seminary his ardent piety was alike dissatisfied with the Cartesian philosophy and the Gallican liberties, the former granting too much to human reason, the latter verging to schism, neither being absolute enough. Yet he preserved in his new calling all the love of liberty which had animated his youth, linking it with the vital idea of Christianity, and his peculiar tendencies gave rise to some eccentricities that attracted the notice of his superiors both before and soon after he was ordained to the priesthood in 1827. Appointed almoner in the college of Henry IV., he there became acquainted with the abbé de Lamennais, the prophet at once of ultramontaniam in religion and radicalism in politics; and though Lacordaire had previously manifested similar ideas, he has sometimes been called one of Lamennais' best works. In 1830 Lacordaire and Montalembert associated themselves with Lamennais in founding *L'avenir*, a journal whose motto was *Dieu et la liberté*, and which was devoted to the maintenance of the absolute authority both of the pope and the people. The audacity of its theories and the vehemence of its language caused the editors to be quickly arraigned before the civil tribunal, where Lacordaire pleaded their cause himself and gained an acquittal. He had previously sought in vain to be enrolled as an advocate, notwithstanding his priestly dignity. He united himself with Montalembert and De Caux in opening without regard to legal regulations a free school, which they refused to close at the summons of the authorities, and which was finally suppressed by the police. Lacordaire was again their advocate, and, after boldly demanding the punishment of the ministry for a violation of the charter, was condemned to the smallest penalty allowed by the law. While the clergy of France and Europe were hesitating concerning the novel doctrines advanced with so much zeal and ability, there appeared from Gregory XVI. an encyclical letter (Sept. 18, 1832), severely condemning them. Rejecting all their dogmas, it declared "the whole idea of the regeneration of the church absurd, liberty of conscience a delirium, freedom of the press fatal, and inviolable submission to the prince a maxim of faith."

The three chiefs of *L'avenir* had gone to Rome with the hope of preventing this decision; and while Lamennais prepared to rebel, Lacordaire resigned himself simply and sincerely to obedience. He announced in a pamphlet that for the future he knew no other guide than the church, no other need than union, no other ambition than to rally around the holy see and the bishops of France, and that till his last sigh he should give his testimony for God, for his church, and for the Roman church in particular. On his return to Paris he began to preach in the college of Stanislas, and in the following year in Notre Dame, where his sermons were admired not less for their literary excellence and a sort of romantic tone than for their religious fervor. "He knows more of literature," said a severe critic, "than of history, more of history than of philosophy, and more of philosophy or even politics than of religion;" and in his conferences all the social questions which had recently agitated France were discussed with an ability and splendor of style that attracted the most eminent men of letters. After two years of success, he again went to Rome in 1836, for the purpose, as was said, of studying theology, and there wrote his *Lettre sur le saint siège*, a solemn argument and protest against the doctrines of *L'avenir*. He had already conceived the plan of reviving or founding a religious order in France, and after preaching in 1838 in Notre Dame he returned again to Rome, entered the order of the Dominicans and the convent of the Minerva, passed his novitiate in the convent of Quercia, wrote his *Vie de Saint Dominique* (Paris, 1840; new ed. 1858; translated into Spanish, Polish, and German), and in 1841 resumed his chair at Notre Dame, a friar preacher with shaved head and white robe. He preached afterward in the principal cities of France, re-establishing the order of Dominicans, and displaying a new style of eloquence, which excited at once surprise and enthusiasm. On the outbreak of the revolution of 1848, being elected to the constituent assembly, he appeared there in his Dominican habit, and took his place on "the mountain," two benches from Lamennais, but soon gave in his resignation when he found that his reconstructive theories would have little chance in the conflicts of partisan politics. In 1853 he preached a sermon at St. Roch, containing political allusions which caused his temporary removal from his office at Notre Dame. "The abbé Lacordaire," it was said, "loves to walk on the edge of the precipice from which he once narrowly escaped." He retired in the following year, and assumed the direction of the college of Sorèze. On Feb. 2, 1860, he was elected to the French academy to fill the vacancy caused by the death of De Tocqueville. Among his writings, beside several volumes of *Conférences*, are *Considérations philosophiques sur le système de M. de Lamennais* (1834), and a *Mémoire pour le rétablissement en France de l'ordre des frères prêcheurs* (1840). An edition of his complete works was published in 1858.

LACQUER, a transparent or colored varnish for covering articles of brass or wood, either for ornament or to preserve them from becoming tarnished. Shell lac is the basis of the varnish commonly employed, whence the coating is termed lacquer, and the process lacquering. Holtzapffel gives the following receipts for "hard wood lacquer": 2 lbs. of shell lac to 1 gallon of alcohol, but without turpentine; or 1 lb. of seed lac and 1 lb. of white rosin, dissolved in 1 gallon of alcohol. The preparation is similar to that already described under the title FRENCH POLISH, and the manner of applying it is also similar to the process there given. Various receipts are given for the lacquer for brass; the simplest and best pale lacquer is made by dissolving, without the application of heat and by agitating together for 5 or 6 hours,  $\frac{1}{4}$  lb. of best pale shell lac and one gallon of alcohol. After standing for some time the clearer portion may be decanted, or the whole filtered through paper, and afterward kept in a close bottle excluded from the light. To give a yellow tint, gamboge, turmeric, Cape aloes, &c., may be added to the shell lac; and for a red, dragons' blood and annatto. The most convenient method of employing the colors is to make saturated solutions of them in alcohol, and to add suitable quantities of these to the pale lacquer. Solutions of turmeric, gamboge, and dragons' blood will be the most useful. The turmeric gives a greenish yellow tint, and with the addition of a little gamboge gives the green color to the lacquer used for bronzed works. Brass work should be lacquered as soon as possible after polishing; and if there must be a delay of several hours, it is advisable to cover the polished surface either with a coating of clean oil or with clean cloths; or the articles may be kept bright a few hours by immersing them in pure water. Before applying the lacquer all trace of grease or oil must be removed, by wiping with a rag and rubbing with whitening. It is well to heat the metal nearly to the temperature of boiling water; this prevents the lacquer from being chilled by atmospheric moisture condensed on the metal, and causes the alcohol to evaporate quickly; the lacquer moreover flows more readily, and attaches itself more firmly to the metal. Great care should be taken to guard against excess of heat, which by inducing oxidation would involve repolishing. The access of dust is also to be carefully avoided. Different methods of heating are in use. Manufacturers are provided with a stove specially contrived for the purpose. Gas jets are also arranged to heat a plate upon which the articles are placed, and tubes and other hollow articles are heated by filling them with hot water, and sometimes small pieces are dipped into boiling water. The friction of polishing imparts to some works the required heat. The lacquer is applied with a camels' hair brush rapidly and uniformly, a second coating following the first immediately; in large pieces the two are carried along simultaneously, the

one a little in advance of the other. The metal may if necessary be reheated for the second application. Circular works are generally lacquered in the lathe. In case of imperfections in the operation requiring the removal of the lacquer, it may be taken off while warm by a rag moistened with alcohol; but if it has become hard, it will be necessary to make use of emery paper, or to boil the work in potash lye.

LAORETELLE, PIERRE LOUIS, a French jurist and author, born in Metz in 1751, died in Paris, Sept. 5, 1824. He had gained distinction both as an advocate and *littérateur*, when in 1778 he went to Paris, and was chiefly occupied for several years in drawing up the memoirs printed in the *Grand répertoire de jurisprudence*. His *Discours sur le préjugé des peines infamantes* was crowned by the French academy in 1786, and other writings on the philosophy of legislation gained him admission into the circle of the encyclopædists. A promoter of the revolution, he voted in the legislative assembly with the minority which defended the constitution of 1791, supported the constitution in the club of the Feuillants, opposed the accusation of Lafayette in 1792, and afterward retired from Paris till the 9th Thermidor. He was a member of the legislative body in 1801, and succeeded La Harpe in the French academy in 1808. He accepted no office under the empire or the restoration, and wrote against the latter in the *Minerve Française*, founded in 1817 by Benjamin Constant, Étienne, Jony, and others, of which he was one of the editors. His complete works, which treat various questions in philosophy, literature, and politics, were published in 1824 in 6 vols.—JEAN CHARLES DOMINIQUE DE, brother of the preceding, a French historian, born in Metz, Sept. 3, 1766, died in Bel-Air, near Mâcon, March 26, 1855. He went to Paris in 1787, and was engaged to analyze and reproduce for the *Journal des débats* the speeches made in the constituent assembly, furnishing at the same time many articles to the journals. He soon took rank in the moderate party both as a writer and as an orator in the club of the Feuillants. After the execution of Louis XVI., of which he composed the narrative that was generally copied and translated, he occupied himself in lecturing on history and in writing for the *Journal de Paris* and the *Républicain Français* against the Jacobin party. On the 18th Vendémiaire (year IV.) he was proscribed as one of the leaders of the royalist movement against the convention. He returned to Paris only to be arrested on the 18th Fructidor, and imprisoned for 23 months (1797-'9). Under the empire he was a member of the bureau of the press, editing at the same time *Le publiciste*, became dramatic censor in 1810, successor of Esménard in the academy in 1811, and professor of history in the faculty of letters in 1812, where for 39 years his course was one of the most numerously attended. He was among the first to rally around the Bourbons in 1814, and in the *Journal des débats* pronounced their re-

turn the triumph of constitutional government over imperial absolutism. When in 1827 Peyronnet proposed a law restricting the press, Lacretelle delivered before the academy an eloquent harangue against it, which led that body to address the king in opposition to it. For this speech he lost his office of censor. He was made commander of the legion of honor in 1845, and retired to Mâcon in 1848, where during the remainder of his life he was frequently visited by men of letters. His historical works, 9 in number and forming 29 volumes, comprise the whole period from the commencement of the religious wars in France to the accession of Louis Philippe, but most fully that of the first revolution. Most of them have the merit of being the first that were written on the period of which they treat, and the judgments are often those of a contemporary partisan.

LACROIX, PAUL, a French novelist and historical and philological writer, born in Paris, Feb. 27, 1807. Under the pseudonyme of *Le bibliophile Jacob*, he wrote a number of historical tales and novels, in which he made use of the old French language. In 1834-'5 he published his *Histoire du 16<sup>e</sup> siècle en France, d'après les originaux manuscrits et imprimés* (4 vols. 8vo.). Encouraged by success, he produced in rapid succession an extraordinary number of novels, translations, and historical, philological, bibliographical, and even polemical works. He has also been the editor of, or a contributor to, many periodicals, keepsakes, and illustrated publications. Since 1854 he has edited the *Revue universelle des arts*, published simultaneously at Paris and at Brussels. He was appointed in 1855 keeper of the arsenal library, and is a member of historical committees connected with the ministry of public instruction.—His wife, Apolline Biffe, who was once an actress under the name of Pauline Derfeuille, has lately gained some reputation as a novelist.—JULES, a French poet and novelist, brother of the preceding, born in Paris, May 7, 1809. In 1830 he published a translation of Shakespeare's "Macbeth," which was highly praised by literary critics. He subsequently applied himself to novel writing, in which line of composition he is more remarkable for bitterness of sentiment, satirical power, and intricacy of plot, than morality and chasteness of style. His 5 act tragedy, *Le testament de César*, was performed with success on Nov. 10, 1849, at the *théâtre Français*. In his *Valéria*, another play of the same dimensions, written in conjunction with Auguste Maquet, Rachel filled two different parts. His literal version of Sophocles's *Edipus Rex* was performed with marked success, Sept. 13, 1858.

LACROIX, SILVESTRE FRANÇOIS, a French mathematician, born in Paris in 1765, died there, May 25, 1843. He belonged to a poor family, but by his own exertions acquired an education, and became such a proficient in mathematics, that when scarcely 17 he was appointed professor in the marine school at Rochefort. His treatise upon maritime insurance was

rewarded in 1787 with a prize by the academy of sciences. He was among the original members of the institute, and undertook in 1796 the publication of his elementary *Cours de mathématiques*, comprising arithmetic, algebra, geometry, and trigonometry, which was for years the best text book of its kind. Meanwhile his *Traité du calcul différentiel et intégral* (2 vols. 4to., Paris, 1797) elicited unqualified praise from Laplace. Among his other works are an *Introduction à la géographie mathématique et à la géographie physique* (1801); *Essai sur l'enseignement des mathématiques* (1805); *Traité élémentaire du calcul des probabilités* (1816); *Manuel d'arpentage* (1825); and *Introduction à la connaissance de la sphère* (1828). His publications did not interfere with his duties as a professor, which he performed for about 60 years with scarcely an interruption.

LA CROSSE, a W. co. of Wis., separated from Minn. by the Mississippi river, bounded N. W. by Black river, and drained by the La Crosse; area, 540 sq. m.; pop. in 1855, 8,904. It has an undulating surface and is well timbered. The soil consists of a rich sandy loam. Organized in 1851. Capital, La Crosse, the W. terminus of the La Crosse and Milwaukee railroad.

LACTANTIUS, LUCIUS CÆLIUS FIRMIANUS, one of the fathers of the Latin church, supposed to have been born in Firmium, Italy, about the middle of the 3d century, died in Treves, Germany, about A. D. 325. The details of his life, and even his exact name, are involved in some uncertainty. In his youth he removed to Africa, and studied rhetoric at Sicca under Arnobius. He was invited by Diocletian to settle at Nicomedia in Bithynia, whither he proceeded about 301. Here he opened a school, but the Nicomedians had so little taste for the study of Latin eloquence that Lactantius was speedily reduced to poverty and constrained to abandon his profession. He now applied himself to literary composition, and probably about this period embraced Christianity. About 312 he was summoned to Gaul to superintend the education of Crispus, the son of Constantine the Great. Before his conversion to Christianity, Lactantius had been a diligent student of the great Roman orator, whose harmonious and eloquent style he had labored so successfully to imitate that he acquired from posterity the appellation of the "Christian Cicero." The editions of his works are very numerous; the most complete and best executed is that of Père Édouard de St. François Xavier (14 vols. 8vo., Rome, 1754-'9).

LACTIC ACID, a product of the decomposition of any kind of sugar in solution, induced by the presence of certain albuminous ferments, as diastase exposed for some time in solution to the air. Milk contains both the elements for the production of this acid, one the sugar of milk, and the other the albuminous caseine. Its change to sour milk is called the lactic fermentation, and lactic acid is a product of this change. It was in sour milk that the acid was originally discovered by Scheele, whence he

named it lactic; but it has since been obtained from the juices of many vegetables, and from the fluids of the stomach and flesh of animals. It is generally admitted to be the cause of the acidity of the gastric juice. As milk turns, the coagulum which is formed is a combination of lactic acid and caseine. If the lactic acid be taken up by bicarbonate of soda, the caseine set free induces further fermentation, and more lactic acid is formed from the sugar of milk; and so by adding more soda the process may be kept up until all the sugar of milk is converted into lactic acid. If a succeeding fermentation be allowed to take place, butyric acid is produced. The composition of lactic acid is expressed by the formula,  $C_3H_5O_3 + HO$ ; and as that of fruit sugar is  $C_{12}H_{22}O_{11}$ , it is probable that the elements of one equivalent of the latter merely change their grouping to form 2 equivalents of the former. When concentrated *in vacuo* over sulphuric acid, lactic acid is obtained in the form of a sirupy colorless fluid, of specific gravity 1.22, and of very sour taste. At a temperature of  $266^\circ F$ . it loses its equivalent of water and becomes an anhydrous solid, which dissolves sparingly in water, but readily in alcohol and ether. Lactide is a crystalline substance, of composition  $C_6H_8O_4$ , produced by subjecting the acid to a temperature of  $482^\circ$ .—In the animal economy lactic acid is thought to play an important part from its property of dissolving large quantities of freshly precipitated phosphate of lime; and this has led to its prescription in medicine with the view of its removing phosphatic deposits in the urine. It has also been recommended in certain forms of dyspepsia. The acid may be conveniently prepared by evaporating sour milk to  $\frac{1}{2}$  its bulk, filtering, adding lime, again filtering, separating the crystals of lactate of lime which form, purifying these by redissolving and recrystallizing, and finally decomposing the salt by means of oxalic acid and recovering the lactic acid by filtering. The salts formed by this acid with bases are called lactates. The only one of importance is the lactate of iron, which is much employed in medicine as a stimulant and tonic. It is prepared by digesting lactic acid and iron filings at a gentle heat on a sand bath for 5 or 6 hours, and then allowing the liquor to boil. It is then filtered, concentrated, and allowed to cool and crystallize. The crystals are then drained in a funnel, washed with alcohol, dried rapidly, and transferred to a bottle, which must be well stopped. Particular directions for the preparation of the salt are given in the "American Journal of Pharmacy," Nov. 1853. Lactate of iron when pure is in white crystalline plates. It has an acid reaction, is soluble in 40 parts of boiling water, and the solution soon becomes yellow from the iron passing to a higher degree of oxidation. When sold in a powdered state, it is apt to be adulterated; for this reason it should be purchased in the crystals. The medicinal applications may be in the form of lozenges or sirup. In one of

the Paris hospitals it has been introduced into bread, hence known as chalybeate bread, a grain of lactate of iron in each ounce, which does not injuriously affect the taste or quality of the bread. This is given to patients suffering from chlorosis, and in other forms the medicine has proved beneficial in this disease. It is observed that it acts decidedly to increase the appetite.

LACTOMETER. See GALACTOMETER.

LADAKH, or MIDDLE THIBET, a country on the N. W. frontier of Hindostan, forming part of the kingdom of Cashmere, bounded N. by Khoten and the unexplored region S. of Chinese Tartary, E. by Great Thibet, S. and S. W. by Cashmere proper, and W. by Cashmere and Bultistan, lying between lat.  $32^\circ 20'$  and  $35^\circ N$ , and long.  $75^\circ 30'$  and  $79^\circ 30' E$ ; area, 26,036 sq. m.; pop. about 125,000. The country is elevated and rugged, lying mostly between the Kuen-lun range and the Rupshu, Spiti, and Zaskar mountains. The river Indus flows N. W. between these ridges, its elevation here being about 15,000 feet above the sea. The climate is cold and arid. The soil is sterile, but the slopes, being industriously cultivated, produce wheat, barley, buckwheat, apples, and apricots. Iron, lead, copper, and sulphur are found in considerable quantities. The people of Ladakh are mostly Thibetans. They are mild, good-humored, peaceable, and honest, but very sensual. They carry on a trade in wool, used for the manufacture of Cashmere shawls. The country was formerly governed by independent despots, from whom it was wrested by Gholab Sing, the late rajah of Cashmere, in 1835. Capital, Leh.

LADANUM, or LABDANUM, a resinous exudation of various evergreen shrubs of the genus *cistus*, principally of the *C. creticus*, found in the islands of the Grecian archipelago and the neighboring countries. It is collected by drawing over them a kind of rake with leather teeth, to which the juice adheres. It is said to have been collected also by combing the beards of the goats that browse among the shrubs, and is still so gathered from the fleeces of the sheep. The purer variety sometimes found in commerce is put up in bladders in masses of several pounds each. The substance readily softens and becomes adhesive in the hand. Externally it is dark red, almost black, and internally grayish. It diffuses an agreeable balsamic odor, and has a bitter and somewhat acrid taste. The common quality is very largely mixed with sand and other foreign matters; it is in spiral-shaped pieces of dark gray color, and hard and brittle. It contains only about 20 per cent. of resin, while in the purer quality 86 per cent. has been found; the other ingredients are gum and wax, with malate of lime, and in the common quality 72 per cent. of foreign substances. Ladanum is used in fumigation, and has been employed in medicine as a stimulant expectorant, and also as an ingredient of plasters.

LADD, WILLIAM, an American philanthropist, born in Exeter, N. H., in 1778, died in Ports-

mouth, April 9, 1841. He was graduated at Harvard college in 1797, and subsequently took an active part in organizing the American peace society, of which he was for many years president, and in behalf of which he labored efficiently until the close of his life. In the interests of this society he edited the "Friend of Peace," commenced by Dr. Noah Worcester, and the "Harbinger of Peace," and published a number of essays and occasional addresses on the subject of peace. He carried his views to the extent of denying the right to maintain defensive war, and caused this principle to be incorporated into the constitution of the American peace society.

LADINO (Sp., versed in an idiom, or speaking different languages fluently), a term applied throughout Central America to the half-breed descendants of whites and Indians—originally only to the offspring of the Spanish conquerors by native women. It was sometimes used by the royal governors and officers in Central America, very nearly in the sense of *criollo* or *creole*, as distinguishing Spaniards born in the country from those who had emigrated from the Peninsula. Since the independence of the country, this name, in common with others implying distinctions of race or caste, has fallen into disuse, and is now rarely heard.

LADISLAS II., king of Poland, born in Lithuania in 1348, died in Grodek, near Lemberg, Galicia, May 31, 1434. He was the son of Olgerd and grandson of Gedimin, great princes of Lithuania, and as a pagan prince, though the son of a Christian mother, received the name of Jagiello or Jagello. He succeeded his father in Lithuania, defending his rights against his uncle Kieystut, and in 1386, having married Hedvig, the beautiful and pious younger daughter of Louis the Great, king of Hungary and Poland, became a Christian and received the Polish crown. He converted Lithuania to Christianity, placed its government in the hands of one of his brothers, and subsequently of Witold, the son of Kieystut, and finally united it with Poland. He was successful in his wars against the Teutonic knights, whom he routed in the battle of Grünwald (1410). He thus greatly contributed to the development of the power of his kingdom, which was ruled by his dynasty down to 1572, when it became an elective state.—His son and successor, LADISLAS III., having been elected king of Hungary, waged war with the Turks, made peace with them, broke his oath, and fell in the battle of Varna (1444). He was succeeded in Poland by his brother Casimir IV.

LADOGA, a Russian lake, and the largest in Europe. It is surrounded by the Russian governments of Viborg, Olonetz, and St. Petersburg, between lat. 59° 58' and 61° 46' N., long. 29° 50' and 32° 55' E.; greatest length 130 m., breadth 70 m.; area, 6,800 sq. m. Its depth is very variable, being in some places 150 fathoms, and in others too shallow for navigation. Its coast is generally low, much indented, and dangerous from hidden reefs. Its waters abound

with fish. Storms are frequent and sudden, and the influx of 70 streams causes strong and uncertain currents. It is connected with Lake Onega by the river Svir, with Lake Ilmen by the Volkhov, and with the gulf of Finland by the Neva. It contains several islands, some of them inhabited; the largest are Valamo on the N. and Konovitz on the S. The principal towns on its coasts are Kexholm, Schlüsselburg, Serdopol, and Novaia (New) Ladoga. The Ladoga, Siasi, and Svir canals form a continuous line around the S. and S. E. of the lake.

LADRONE, MARIANNE, or MARIANA ISLANDS, a group of about 20 islands, of volcanic formation, in the N. Pacific ocean, N. of the Caroline islands, between lat. 18° and 21° N., long. 144° and 146° E. Only 5 are inhabited; pop. 10,000. When the Spanish missionaries sent by Queen Mariana, widow of Philip IV. of Spain, established themselves on the islands toward the end of the 17th century, the natives numbered 40,000. The present inhabitants are mostly descendants of settlers from Mexico and the Philippines. The soil is fertile in sugar, rice, corn, tobacco, cotton, and indigo. The climate is salubrious, the heat being tempered by the trade winds. Horses, cattle, and llamas were early introduced by the Spaniards; wild hogs are numerous and of huge size. The islands yet belong to Spain. The principal are Guahan or Guam, Rota, Agniguan, Saypan, Anatchan, and Tinian. Lord Anson visited Tinian in 1743, and found there cyclopean ruins. The seat of government is at St. Ignazio de Agaña, on the island of Guahan, the most southerly of the group, where there is also a good fortified harbor. The general navigation is rendered dangerous by shoals and currents. A pearl fishery exists on the coast of Saypan. Magellan discovered the islands in 1521. They were named Ladrone from the thievish disposition of the natives; and Marianne or Mariana in honor of the Spanish queen.—There are two other small groups of islands called Ladrone: one in China at the mouth of the bay of Canton, a great resort of pirates; and the other in the Pacific off the coast of New Granada.

LADY (Anglo-Saxon, *hlafdis*, *hlafdig*), a word supposed to have signified originally "loaf-giver" (Goth. *hlaf*, loaf, and *dian*, to serve or distribute), from the practice of the wives of the rich distributing bread to the poor, or to their guests and domestics. Tooker, however, derives it from *hlifan*, to lift, i. e., one raised to the rank of her husband or lord. As a title of honor in England, lady is the correlative of lord; it belongs of right to the daughters of all peers above the rank of viscount, and is extended by courtesy to the wives of baronets and knights. In common usage the term is employed also in speaking of women of the better classes generally, and in the United States of almost any well dressed female.

LADY-BIRD (sometimes called LADY-BUG), a small beetle of the trimerous division, and the genus *coccinella* (Frisch). In this extensive and

well known genus the body is hemispherical, the thorax very short, the antennæ composed of 11 joints and the tarsi of 8, the elytra convex, the under surface flat, and the legs short; the digestive canal is nearly straight, and as long as the body. The general colors are red, yellow, or orange with black spots, or black with white, red, or yellow spots. There are many species described. The larvæ are small, bluish, flattened grubs, spotted with red or yellow, and with 6 legs on the anterior part of the body; they are hatched from yellowish eggs, of a disagreeable odor, laid usually in the spring in clusters among the *aphides* or plant lice. Both the larvæ and the perfect insects destroy immense numbers of these lice, and are therefore among the best friends of the agriculturist; when found upon plants they are in quest of their insect prey, and deprive vegetation of none of its juices, and they are entirely guiltless of producing the potato rot or any other similar disease. There are some very small lady-birds of a blackish color, and with a few short hairs, of the genus *scymnus*, whose larvæ are as savage among the plant lice as the lion among the smaller mammals. These genera contain some of the prettiest of insects.

LÆLIUS, CAIUS, surnamed SAPIENS, a Roman publicist, born about 186 B. C., died about 115. He was tribune of the people in 151, prætor in 145, and consul in 140. After his consulship he was assigned the province of Lusitania, and conducted a successful campaign against the formidable guerilla chief Viriathus. At the commencement of his political career Lælius inclined to that party in the state which sought to infuse vigor into the masses, by raising them to the condition of territorial proprietors; but the excitement and violence to which the measures of the elder Gracchus had given birth so alarmed him that he at length withdrew from the popular side, and supported the aristocracy. In 182 he aided the consuls against the partisans of Tiberius Gracchus, and in 180 he opposed the passing of the Papirian rogation. For the course which he pursued in that period, his friends and faction honored him with the cognomen of *Sapiens*, or the Wise. In common with the younger Scipio, he had early applied himself to the language and learning of Greece, and had imbibed the doctrines of the stoics from the philosophers Diogenes of Babylon and Pannætiæ. Cicero was a great admirer of the politics and character of Lælius, and introduces him as a leading interlocutor in several of his dialogues. Seneca counselled his friend Lucilius "to live like Lælius" if he would live worthily.

LAENNEC, RENÉ THÉODORE HYACINTHE, a French physician, the discoverer of mediate auscultation, and the inventor of the stethoscope, born in Quimper, Lower Brittany, Feb. 17, 1781, died there, Aug. 18, 1826. He began the study of medicine under his paternal uncle, a distinguished physician of Nantes. In 1800 he went to Paris, and attached himself to the clinical school of the charity hospital, then directed

by Corvisart. He obtained the degree of M.D. in 1814, and became principal editor of the *Journal de médecine*. In 1816 he was appointed chief physician of the Necker hospital, where he soon after made that discovery which has immortalized his name. In 1819 he published his great work entitled *Traité de l'auscultation médiate et des maladies des poumons et du cœur*, a good English translation of which was made by Dr. Forbes of Chichester. In 1821 he was nominated private physician to the duchess of Berry, and professor of medicine in the college of France. But ill health soon compelled him to resign and retire to his native town, in which his latter days were spent. (See AUSCULTATION.)

LAER, or LAAR, PETER DE. See BAMBOOCIO.

LAFARGE, MARIE CAPPELLE, a French woman notorious for her condemnation as a poisoner, born in Villers-Hellon, Aisne, in 1816, died in Ussat, a watering place in the Pyrénées, Nov. 7, 1852. She belonged to a good family; but having lost her parents when a child, she was carelessly educated and left to indiscriminate novel reading. Living at the house of her aunt, Mme. Garat, the wife of the secretary-general of the bank of France, she was accustomed to all the refinements of Parisian life; but after the death of her grandfather in 1838, having married Pouch-Lafarge, an owner of iron works in the department of Corrèze, her husband, who had represented himself as a wealthy country gentleman, took her to an old, dilapidated, and scantily furnished house, where she had to attend to the common duties of a housekeeper, with a husband whose vulgar manners were repugnant to her taste, and a hard-tempered mother-in-law who was predisposed against her. Her disappointment found vent in bursts of anger, followed by family quarrels and deep-seated rancor. After about 16 months her husband was seized with a strange illness; she nursed him with apparent affection; but, under her almost exclusive care, his condition became worse every day, and within a fortnight he died. Strong suspicions of poison arose, and were soon fixed upon Mme. Lafarge, who at that time, it was proved, had twice purchased arsenic under pretence of killing rats. She was consequently arrested, and when in confinement was charged by one of her relations with having stolen a set of diamonds; and these having been found in her possession, she was sentenced to two years' imprisonment (April, 1840). Not daunted by this, she published her *Mémoires*, in which she represented herself as the victim of a deep-laid conspiracy, and declared her innocence of both robbery and poisoning. These *Mémoires*, which were extensively read, convinced many of her innocence, while they increased the hostility of her opponents. The public at home and abroad became interested in her case. She secured the services of three eminent advocates; and in the first stage of the trial the evidence against her was so slight that a verdict of acquittal was confidently expected by her friends, when the cele-

brated Orfila, who had been intrusted with a chemical examination of the body of the deceased, reported the discovery of evidences of poison. Mme. Lafarge was found guilty and sentenced to hard labor for life (Sept. 1840). Public opinion was still divided. The eminent chemist Raspail vigorously impugned the report of Orfila, and a bitter controversy ensued. The convict, who meanwhile had been incarcerated in the central prison at Montpellier, continued to be the recipient of marks of sympathy. After 12 years of imprisonment she was permitted to remove to the convent of St. Rémy, and the interest manifested in her behalf on account of her failing health contributed to procure her liberation in June, 1852. She removed to the watering place where she breathed her last, still protesting her innocence. A small volume under the title of *Heures de prison*, containing her thoughts during her confinement, was published after her death.

LAFAYETTE, the name of 5 counties in the United States. I. A N. co. of Miss., drained by Tallahatchee river and its tributary the Yocknapatalfa; area, 790 sq. m.; pop. in 1850, 14,069, of whom 5,719 were slaves. It has a rolling surface covered here and there with small tracts of timber. The soil is fertile. The productions in 1850 were 562,530 bushels of Indian corn, 105,700 of sweet potatoes, 45,985 lbs. of rice, 22,288 of honey and wax, and 10,887 bales of cotton. There were 11 grist mills, 17 saw mills, 2 newspaper offices, 38 churches, and 469 pupils attending public schools. The Mississippi central railroad passes through Oxford, the capital. II. A S. parish of La., traversed by Vermillion river, which is navigable by steamboats; area, 850 sq. m.; pop. in 1855, 7,798, of whom 3,816 were slaves. The surface is level and the soil rich and alluvial. The productions in 1855 were 145,910 bushels of Indian corn, 87 bbls. of rice, 3,021 of molasses, 1,882 hhd. of sugar, and 5,753 bales of cotton. The New Orleans, Opelousas, and great western railroad, now in progress, is to pass through the parish. Capital, Vermilionville. III. A S. W. co. of Ark., bordering on La. and Tex., and traversed by Red river and its Sulphur fork; area, 1,260 sq. m.; pop. in 1854, 3,445, of whom 2,311 were slaves. It has a good soil and a level surface, consisting partly of prairie. The productions in 1854 were 203,136 bushels of Indian corn, 100 of wheat, 4,260 of oats, and 8,211 bales of cotton. Capital, Lewisville. IV. A W. co. of Mo., bounded N. by the Missouri river and drained by a number of small streams; area, 450 sq. m.; pop. in 1856, 17,070, of whom 6,107 were slaves. It was formerly called Lillard. The surface is undulating and well timbered. Limestone, sandstone, and coal are abundant, and the soil is remarkably fertile. The productions in 1850 were 788,675 bushels of Indian corn, 83,037 of wheat, 94,075 of oats, 2,462 tons of hemp, 2,358 of hay, 154,668 lbs. of butter, and 82,925 of wool. There were 4 grist mills, 7 saw mills, 2 newspaper offices, 22 churches, and 962 pupils

attending public schools. Capital, Lexington. V. A S. W. co. of Wis., bordering on Ill., and drained by Fevre and Pekatonica rivers; area, 630 sq. m.; pop. in 1855, 16,064. It has an undulating surface, thinly timbered. In the N. W. part are several regular hills called the Platte mounds. Lead, copper, and limestone are abundant. The soil is fertile. The productions in 1850 were 91,491 bushels of Indian corn, 62,283 of wheat, 175,861 of oats, 18,804 of potatoes, and 9,196 tons of hay. There were 6 saw mills, 18 churches, and 3,203 pupils attending public schools. Capital, Shullsburg.

LAFAYETTE, a city of Indiana, capital of Tippecanoe co., situated at the head of navigation on the E. bank of Wabash river, 63 m. N. W. from Indianapolis; pop. in 1850, 6,129; in 1859, about 11,000. It is built on rising ground enclosed in the rear by hills and cliffs, and, including its suburbs, covers an area of 2 miles square. It is on the line of the Wabash and Erie canal, and the Toledo, Wabash, and western, the New Albany and Salem, the Lafayette and Indianapolis, and the Lafayette and La Salle railroads, by means of which and the river it is enabled to command the trade of a rich and extensive surrounding prairie country. It has a well of sulphur water, resembling in its analysis the Blue Lick springs of Kentucky. In 1859 the city contained 15 churches (1 Baptist, 1 Christian, 1 Episcopal, 1 Lutheran, 3 Methodist, 3 Presbyterian, 2 Roman Catholic, 1 United Brethren, 1 Unitarian, and 1 Universalist), 2 daily, 2 tri-weekly, and 8 weekly newspapers, a branch of the bank of the state of Indiana, a number of good hotels, several public and private schools, an insurance office, flour mills, iron foundries, brick yards, 2 manufactories of agricultural implements, a paper mill, a woollen factory, a planing mill, 3 soap and candle factories, 2 breweries, 2 distilleries, and 2 tanneries. It was laid out in 1825, and received its present municipal charter in 1857.

LAFAYETTE, MARIE JEAN PAUL ROCH YVES GILBERT MOTIER, marquis de, a general of the American revolution and a French statesman, born at the chateau of Chavagnac, near Brionne, Auvergne (in the present department of Haute-Loire), Sept. 6, 1757, died in Paris, May 19, 1834. His family was one of the most ancient and eminent in the French nobility. One of his ancestors was a marshal of France, distinguished for his military achievements, and particularly for defeating and killing the duke of Clarence at Beaugé, an action which saved his country from entire conquest by Henry V. of England. Another of his ancestors, Mme. de Lafayette, the intimate friend and correspondent of Mme. de Sévigné, was one of the most brilliant ornaments of the court of Louis XIV., and the author of the first romance which relied for its success on domestic character. His father, the marquis de Lafayette, was an officer of the army, and fell in battle in Germany at the age of 25. His mother died soon afterward, and he was thus left while yet an infant

the heir to an immense estate. At an early age he was sent to the college of Pleasis at Paris, and when only 16 married a lady still younger than himself, a daughter of the count d'Ayen, son of the duke de Noailles. He entered the army as an officer of the guards, and in 1776 was stationed at Metz with his regiment, in which he was a captain of dragoons. At a dinner given by the commandant of the garrison to the duke of Gloucester, brother of the king of England, who was then on a visit to Metz, Lafayette heard that the American colonies had declared their independence. Before he left the table he had mentally resolved to draw his sword in the cause of American liberty, and he repaired immediately to Paris to make arrangements for the execution of his plan. He became acquainted with the American agents in Paris, Franklin, Deane, and Arthur Lee, and communicated to them his intention of proceeding to America. This was at the darkest period of the revolutionary war, and the news had just reached France of the occupation of New York, of the loss of Fort Washington, and of the disastrous retreat of the Americans through New Jersey. The cause of America looked desperate enough, and the few friends whom Lafayette had apprised of his design urged him to abandon so wild and hopeless a scheme. Even the American commissioners told him they could not in conscience urge him to go. They had not the means even to give him a passage across the Atlantic. But the resolution of Lafayette was inflexible. He replied to the commissioners that the more desperate were the affairs of the Americans, the more necessity was there for giving them assistance; and as for passage, he would purchase a vessel for himself and his companions. He accordingly caused a vessel to be secretly fitted out at Bordeaux. While his preparations were going on, to avert suspicion from himself, he made a visit to his kinsman the marquis de Noailles, then French ambassador in London; but while in Great Britain he scrupulously abstained from using the opportunity afforded of obtaining military information that might be of service to the Americans, carrying his point of honor so far as to decline visiting the naval establishment at Portsmouth. At the end of 3 weeks he returned to France, and without passing through Paris hastened to Bordeaux. Here he learned that the British ambassador at Paris had penetrated his design, and that the government had given orders for his arrest. Though his ship was not quite ready, he instantly made sail for Passages, the nearest port in Spain, where he had scarcely arrived when he was waited upon by two French officers with an order from the king of France directing him to repair to Marseilles. They also brought letters from his relatives censuring him for his conduct, and requesting him to return home; but his young wife, who was devotedly attached to him, and who shared his enthusiasm for American liberty, wrote urging him to stand firm and to proceed on his enterprise. He re-

turned with the officers to Bordeaux by land, leaving his vessel at Passages, and in apparent obedience to the royal command set out for Marseilles; but soon after leaving Bordeaux he took the road to Spain, and, though closely pursued, succeeded in reaching Passages, where he instantly embarked and put to sea. He was accompanied by 11 officers, among them the German veteran baron de Kalb. His departure created a great sensation not only in France but in England. "We talk chiefly," says Gibbon in a letter from London, April 12, 1777, "of the marquis de Lafayette, who was here a few weeks ago. He is about 20, worth 180,000 livres a year, the nephew of Noailles, who is ambassador here. He has bought the duke of Kingston's yacht, and is gone to join the Americans." The passage to America was long and stormy, and there was much danger from the English cruisers on the coast. Lafayette and his companions, however, safely effected a landing in the night near Georgetown, S. C., and, though at first taken for a party of the enemy, were at length received and hospitably entertained in the house of Major Hunger, who conveyed them the next day, April 25, to Charleston, where they were received with enthusiasm. "The sensation produced by his appearance in this country," says Mr. Ticknor, "was, of course, much greater than that produced in Europe by his departure. It still stands forth as one of the most prominent and important circumstances in our revolutionary contest; and, as has often been said by one who bore no small part in its trials and success, none but those who were then alive can believe what an impulse it gave to the hopes of a population almost disheartened by a long series of disasters. And well it might; for it taught us that in the first rank of the first nobility in Europe, men could still be found who not only took an interest in our struggle, but were willing to share our sufferings; that our obscure and almost desperate contest for freedom in a remote corner of the world, could yet find supporters among those who were the most natural and powerful allies of a splendid despotism; that we were the objects of a regard and interest throughout the world, which would add to our own resources sufficient strength to carry us safely through to final success." From Charleston Lafayette proceeded by land to Philadelphia, where congress was then in session. On his arrival he addressed a letter to the president of that body, asking leave to enter the army as a volunteer and to serve without pay. Congress expressed its high sense of the value of his example and of his personal worth by the following resolution: "Whereas the marquis de Lafayette, out of his great zeal to the cause of liberty, in which the United States are engaged, has left his family and connections, and at his own expense come over to offer his services to the United States, without pension or particular allowance, and is anxious to risk his life in our cause: Resolved, that his services be accepted, and that, in consideration of his zeal, illustrious

family and connections, he have the rank and commission of major-general in the army of the United States." His commission was dated July 31, 1777, while he yet lacked more than a month of being 20 years of age. The appointment, however, was considered by congress as merely honorary; but it speedily became apparent that Lafayette was bent on serious service, and was well qualified to command. Washington was then with the army, but he soon arrived at Philadelphia, and he and Lafayette met for the first time at a dinner party. The young Frenchman made a highly favorable impression upon the sagacious and circumspect commander-in-chief, and at the close of the entertainment Washington took him aside, thanked him warmly for the sacrifices he had made in the American cause, and invited him to regard himself at all times as a member of his military family. The personal acquaintance thus commenced soon ripened into an intimacy that was never for a moment interrupted. The private correspondence of Washington shows that he not only felt for Lafayette the warmest affection, but that he entertained the highest opinion of his military talent, personal probity, and general prudence and energy. The youthful major-general was first in active service at the battle of Brandywine, Sept. 11, where he had no separate command, but was attached to the staff of Washington as a volunteer. He plunged into the hottest of the fight, and when the defeated Americans began to retreat, threw himself from his horse, entered the ranks, and exerted himself to rally them. He was shot by a musket ball through the leg, but so ardently was he engaged that he was unconscious of the wound till his aid told him that the blood was running from his boot. He rode with a surgeon to Chester, but would not suffer his wound to be dressed till he had restored order among the troops who were retreating in confusion through the village. It was two months before his hurt was sufficiently healed to enable him to rejoin the army. On Dec. 1 congress resolved "that Gen. Washington be informed that it is highly agreeable to congress that the marquis de Lafayette be appointed to the command of a division in the continental army." This resolve was passed at the request of Washington himself, who 3 days afterward directed Lafayette to take command of the division of Gen. Stephen, who had been dismissed from the army for intemperance. About this period the board of war, of which Gates was the head and which had been created and was controlled by the faction hostile to Washington, planned an expedition to Canada which was approved by congress; and Lafayette was appointed to the command in the expectation that so flattering a distinction would attach him to the party by whom it was conferred. The first intimation that Washington had of the project was from the letter to Lafayette announcing his appointment. The young Frenchman, indignant at the slight offered to his chief in not consulting him,

carried the letter immediately to Washington, told him he saw through the artifice, and would be governed by his advice. Washington advised him to accept the appointment, but told him he did not know where the means could be found to carry out such an expedition. Lafayette accordingly accepted the command, and proceeded to Albany, the designated head-quarters of the expedition; but after waiting 3 months for the promised force and supplies, during which period he took measures for putting the Mohawk valley in a state of defence, he at length received orders from congress to join the army at Valley Forge, and to suspend the irruption into Canada. He returned to the camp in April, 1778, and on May 18 was despatched by Washington from Valley Forge to Barren Hill, 12 miles distant, where he took post with 2,100 men and 5 pieces of cannon. Sir Henry Clinton, the British commander at Philadelphia, on the night of May 19 sent Gen. Grant with 5,000 men to surprise Lafayette. The negligence of the militia outposts permitted the British to approach within a mile before they were discovered, and early in the morning Lafayette found himself nearly surrounded by a greatly superior force of the enemy. But the young general was equal to the emergency. A dexterous stratagem and a skilful movement, promptly conceived and executed, baffled the British general, and conveyed the Americans with their artillery safely across the Schnylkill and back to Valley Forge, where they were greeted with enthusiasm by the main body of the army, which had witnessed from the heights their peril and successful extrication. His conduct in this affair called out the warmest expressions of approbation from Washington. At the battle of Monmouth, June 28, Gen. Lee, to whom as next in rank to the commander-in-chief the command of the advanced forces belonged, refused at first to take it, and Washington gave it to Lafayette; but Lee subsequently changed his mind and applied to be reinstated, to which Lafayette assented with his accustomed grace and disinterestedness, and served under Lee during the battle, in which he displayed great gallantry. Seeing at one point of the engagement a good opportunity to attack the enemy with his division, he rode up to Lee and asked permission to make the attempt. "Sir," replied Lee, "you do not know British soldiers; we cannot stand against them." Lafayette replied: "It may be so, general; but British soldiers have been beaten, and they may be again; at any rate I am disposed to make the trial." Lee yielded to the Frenchman's ardor and gave him permission to attack, which he did with vigor and success until Lee, on beginning the "unnecessary, disorderly, and shameful retreat" for which he was afterward punished by court martial, ordered him to fall back. A few weeks later Lafayette was sent with two brigades of infantry to assist Gens. Greene and Sullivan in the attempt to drive the British from Rhode Island, in which they had at first the assistance of a French fleet under Count d'Estaing,

France having now declared war against England and formed an alliance with the United States. D'Estaing, however, before any thing of importance was effected, withdrew with his fleet to Boston harbor for repairs, in spite of the remonstrances of the American generals. Lafayette was despatched to Boston to endeavor to persuade him to return to Newport, but could only get a promise from him that if required he would march his marines by land to the aid of the Americans. During Lafayette's absence an engagement took place, Aug. 29; and though he rode from Boston to Rhode Island, 70 miles, in 6½ hours, he arrived, to his great disappointment, only in time to assist in conducting the retreat from the island, which the American commanders had decided upon, on learning of the approach of the British fleet with a fresh army on board. Writing to Washington, he said: "That there has been an action fought where I could have been and was not, will seem as extraordinary to you as it seems to myself." Congress on Sept. 19 adopted resolutions thanking Gen. Sullivan and those under his command for their conduct in the action and retreat, and especially requesting the president to inform Lafayette of their sense of his personal sacrifice in going to Boston, and his gallantry in conducting the rear guard and pickets during the retreat. The good understanding between the French and American troops had been somewhat impaired by the conduct of D'Estaing, and Lafayette was of essential service in restoring harmony between them at this most important crisis of the war, when there was danger that fatal dissensions might arise between the new allies.—His own country being now at war, Lafayette, who still retained his commission in the French army, deemed it his duty at the end of the campaign of 1778 to return to France and place himself at the disposal of his government, and at the same time to exert himself in behalf of America by personal conferences with the French ministry. At the particular request of Washington, congress granted him leave of absence, accompanied by resolutions of a complimentary character, and by a letter recommending him to the good offices of the American minister in Paris. Congress also voted that a sword should be presented to him adorned with appropriate emblematic devices. He was detained for a while at Fishkill by a severe illness, but at length embarked for France at Boston in Jan. 1779, on board the American frigate *Alliance*. He returned home, says Mr. Everett, "after two years of absence, marked with honorable scars, and signalized by the thanks of congress, the admiration of America, and the friendship of Washington." He was received with extraordinary demonstrations of popular enthusiasm by all classes of society. His name, introduced into dramatic performances, called out acclamations at the theatres; he was followed by crowds in the streets wherever he went; he made a journey to one of his estates in the south of France, and all the towns through

which he passed received him with processions and civic honors; and in the city of Orleans he was detained nearly a week by prolonged festivities in honor of his return. Amid the admiration and flattery with which he was surrounded he did not neglect the interests of America. He was equally untiring and adroit in his efforts to persuade the French government to send an army to assist the Americans, and also to get a supply of money for the treasury of the United States, which was then in the most destitute condition. The finances of France herself were anything but prosperous, and the obstacles to be overcome before the French ministry could be induced to yield the requisite assistance were of the most formidable nature. But the ardor and perseverance of Lafayette at length triumphed. It was mainly his personal efforts that caused the army of Rochambeau to be sent to America. "It is fortunate for the king," said the old count de Maurepas, the head of the ministry, "that Lafayette did not take it into his head to strip Versailles of its furniture to send to his dear America, as his majesty would have been unable to refuse it." Having procured for the United States assistance both with men and money, Lafayette promptly recrossed the Atlantic, landing at Boston, and on May 11, 1780, after an absence of 15 months, rejoined Washington at the headquarters of the army, bringing himself the first intelligence of his success and of the approaching French succors. He brought also a commission from Louis XVI. appointing Washington a lieutenant-general of the army of France and vice-admiral of its navy, a measure intended, as it afterward operated, to prevent difficulties respecting official etiquette between the French and American commanders. A French fleet bringing Rochambeau and 6,000 soldiers arrived at Newport July 10. As soon as he heard of their arrival, Washington despatched Lafayette to concert measures with Rochambeau for future operations. Soon after his return he was stationed at Tappan on the Hudson in command of 6 battalions of light infantry, watching the movements of the British under Sir Henry Clinton, with whom Arnold, then in command at West Point, was secretly negotiating for the betrayal of that important fortress. Arnold made an attempt to obtain from Lafayette the names of the spies he maintained in New York city, on pretence that intelligence from them might often be conveyed more expeditiously by way of West Point; but Lafayette prudently, and as it turned out fortunately, declined to communicate them. After the discovery of Arnold's treason, Lafayette was one of the court of 14 general officers, convened at Tappan, Sept. 29, by whom Major André was tried as a spy and condemned to death. During Arnold's invasion of Virginia in the beginning of 1781 Washington sent Lafayette, Feb. 20, with 1,200 men of the New England and New Jersey lines, to assist in the defence of that state. They arrived at Annapolis in a state of great destitution, without shoes, hats, or tents. The United States

having neither money nor credit, he purchased for them a full supply with his own funds. His presence inspired the militia of Virginia with fresh hope, and his force was soon doubled in numbers. Toward the end of May Lord Cornwallis took command of the British in Virginia, and, with his usual energy, on the 4th day after his arrival he marched to attack Lafayette, who with about 8,000 troops was posted half way between Richmond and Wilton. Confident in his superiority of numbers, Cornwallis was so sure of success that he wrote home: "The boy cannot escape me." Lafayette, however, made a skilful retreat to the northward, and, though pursued with unusual activity, made his way safely to the Raccoon ford on the Rappahanock in Culpepper county, where he was joined by Gen. Wayne, who had marched from Maryland to his assistance with 800 men. Strengthened by this reinforcement, Lafayette again advanced, and interposed himself in a strong position near Charlottesville between the British army and some large quantities of stores removed from that town on the enemy's approach. Cornwallis marched off toward Williamsburg, pursued by Lafayette, a portion of whose troops overtook the British, July 6, at the Jamestown ford where a sharp action was fought. Continuing his retreat, Cornwallis at last took post at Yorktown. "Lafayette conducted this campaign," says Mr. Everett, "with a vigor, discretion, and success, which saved the state of Virginia, and proved himself to be endowed with the highest qualities of generalship." Having driven the British into Yorktown, he stationed his army so as to cut off their retreat into the Carolinas, and awaited the reinforcements from the north, which came a few weeks later under the command of Washington and Rochambeau. For his services during the siege of Yorktown, where in conjunction with Hamilton he commanded one of the assailing parties, he was publicly thanked by Washington on the day after the surrender of Cornwallis.—At the close of the campaign he returned to France. In granting him leave of absence, congress passed resolutions acknowledging his eminent services, and directing the ministers of the United States in Europe to confer and correspond with him. He was received with the highest enthusiasm in France, and his request for additional men and money for service in America was readily complied with. The enthusiasm spread from France to Spain, and a great expedition of 60 vessels of the line and 24,000 troops was organized to sail from Cadiz under the command of Lafayette, who led 8,000 men from Brest to Cadiz. Soon after his arrival, however, he heard the tidings of the conclusion of peace at Paris; and it was from a letter which he sent from Cadiz, Feb. 5, 1788, that congress first learned the news of the treaty. In 1784, at the invitation of Washington, he revisited the United States, landing at New York, Aug. 4, and proceeding almost immediately to Mount Vernon. He subsequently visited Anna-

polis, Baltimore, Philadelphia, New York, Albany, and Boston, receiving everywhere the warmest testimonials of affection and respect. On his departure in December, congress appointed a solemn deputation of one member from each state to take leave of him on behalf of the whole country. In the year after his return to France he visited Germany, where he was received with much distinction. Frederic the Great paid him marked attention, and took him with him on a military tour of inspection and review. For some years he now occupied himself with efforts to ameliorate the political condition of the French Protestants, and in promoting the abolition of slavery in the colonies. He purchased a plantation in Cayenne, emancipated the slaves, and expended a large sum in their education. The assembly of the notables at Paris, Feb. 22, 1787, was the first step in the French revolution. Of that assembly Lafayette was a member, and contributed essentially to give character to its deliberations. He stepped forth at once the champion of the people, denounced the abuses of the government, proposed the abolition of private arrests and of the prisons of state, the restoration of Protestants to the equal privileges of citizenship, and the convocation of the states-general. "What!" said the count d'Artois, the brother of the king, and afterward king himself as Charles X., "do you demand the states-general?" "Yes," replied Lafayette, "and something better than that." The states-general, which soon became the constituent assembly, met May 8, 1789. According to Jefferson, its initiatory movements were concerted by Lafayette and a small circle of friends at the hotel of Jefferson himself. He proposed in this body a declaration of popular rights not unlike that of the American declaration of independence, and it was by his influence that on the night of July 18, while the Bastille was falling before the people, the decree providing for the responsibility of the royal ministers was carried through. Two days afterward he was appointed commander-in-chief of the national guards of Paris, an organization which rapidly extended throughout the kingdom until it embraced 3,000,000 men, and under his effective management became the controlling power of the country. It was at his suggestion that the tri-color was adopted, July 26, an emblem destined, as he said, to make the tour of the world. His history for a time now became almost the history of France; and while he retained his power it was always exercised on the side of moderation, humanity, and constitutional liberty. A loyal subject, though in principle a firm republican, he defended the freedom of the king as sincerely as he had ever defended the freedom of the people. His courage and coolness during the dreadful tumults of Oct. 5-6 saved the lives of the king and queen from a ferocious mob that had taken possession of the palace of Versailles. When the national assembly decreed the abolition of feudal titles, Lafayette was among the first to lay down that of marquis, which he never

resumed; and the only title which he bore till his death was that of general, which he derived from his commission in the American army. After the splendid and imposing ceremony of the adoption of the constitution, July 14, 1790, in the Champ de Mars, where, in the presence of half a million of people, he took the oath to its support in the name of the nation, he resigned his command of the national guards in an able and patriotic letter, and retired to his estates in the country. When war was declared against the Austrians, March 20, 1792, he was appointed to the command of one of the armies sent to guard the frontier. He established discipline in the army, and won victories at Philippeville, Maubenge, and Florennes. But the Jacobins, who were now becoming predominant in France, hated and feared him, and orders were sent to the camp from the ministry of war designedly to embarrass and annoy him. In return he addressed a letter to the assembly denouncing the Jacobins as enemies of the constitution and the people. The voice of reason for a moment was regarded, and a majority of the assembly and the local assemblies of 75 of the departments gave their formal sanction to his views. But violence at length prevailed, and on Aug. 8 he was denounced in the assembly as an enemy of the nation, and a motion was made for his arrest and trial. After vehement debates it was put to vote and lost by a majority of 407 to 224. But the terrible events of Aug. 10 soon followed, and the reign of terror was established. Commissioners were sent to the army with orders to arrest Lafayette. Arrest at that period was certain death. He saved himself by flight, after placing the army in such a position that his departure could not expose it to danger. He crossed the frontier Aug. 17, intending to take refuge in Holland. But he was seized the same night by an Austrian patrol, and being soon recognized was treated as a criminal and exposed to disgraceful indignities. He was handed over to the Prussians because their prisons were near at hand, and was at first confined at Wesel and afterward at Magdeburg. But the Prussians, unwilling to bear the odium of holding Lafayette a prisoner, soon transferred him again to the Austrians, who consigned him to damp and dark dungeons in the citadel of Olmütz. Here he was told that he would never again see any thing but the four walls of his prison; that he would never receive news of events or of persons; that his name would be unknown in the citadel, and that in all accounts of him sent to court he would be designated only by a number; that he would never receive any notice of his family, or of the existence of his fellow prisoners. At the same time knives and forks were kept from him, as he was officially informed that his situation was one which would naturally lead to suicide. The want of air and of proper food, and the dampness and filth of his dungeon, brought on dangerous diseases, of which his gaolers took no notice; and he was at one period reduced to such a state by his suf-

ferings that all his hair came off. His friends for a long time could get no intelligence of his fate; but at length the persevering inquiries of Dr. Erick Bollmann, a Hanoverian of great address and courage, who was employed by Count Lally-Tollendal, and who had established himself for the purpose as a physician at Vienna, ascertained that he was confined at Olmütz. The military physician of Olmütz by this time had thrice made a formal representation to the Austrian government that Lafayette would die unless he was allowed to breathe a purer air than that of his dungeon. To the first application the reply was made that "he was not sick enough yet;" but at length the outcry of public indignation in Europe compelled them to grant him permission to ride out occasionally in a carriage accompanied by two soldiers. Dr. Bollmann determined to attempt his rescue during one of these airings, and communicated his project to a young American then travelling in Austria, Francois K. Huger, a son of the gentleman at whose house Lafayette had been received on the night of his first landing in America near Charleston, S. C., in 1777. Huger devoted himself to the enterprise with romantic enthusiasm. The two friends went to Olmütz, where in his professional capacity Bollmann contrived to communicate with Lafayette and to agree upon a plan. Their carriage was sent to Hoff, a town 25 miles from Olmütz, and the coachman was directed to be in waiting at a certain hour on the day when Lafayette and his guard rode out. They themselves on horseback lay in wait at a part of the road where Lafayette was accustomed to descend from the carriage and walk. The moment he touched the ground, Lafayette, sick and unarmed as he was, attacked the guards and disarmed one of them, who fled in terror. After a violent contest he also disarmed the other, but in the struggle was badly wounded in the hand. His friends now came up, and placing him on one of their horses told him in English to go to Hoff. He misunderstood the word, and supposing they had merely said "Go off," rode away on the wrong road. Their other horse had been purposely trained to carry two persons, but in the confusion he became frightened and unmanageable, and Huger generously insisted that Bollmann should ride off alone while he made his escape on foot. He was soon arrested by some peasants who had witnessed the affair, while Bollmann arrived safely at Hoff, and, after waiting in vain for Lafayette, passed the frontier into Prussia, where he was soon arrested and delivered to the Austrians. Lafayette meanwhile rode toward Moravia, and, not well knowing the road, asked a peasant to guide him. His bleeding wound and his prison clothing excited the suspicions of the peasant, and he betrayed the fugitive to the police, who took him back to Olmütz next day. Bollmann and Huger were kept in dungeons for 8 months chained by the neck to the floor, but were at length released by the interference of Count Metrowsky, an Austrian nobleman of

liberal character residing near Olmütz. Lafayette himself was confined with redoubled severity. Meantime his wife, who had been put in prison at Paris during the reign of terror, obtained her liberty on the downfall of Robespierre. She then proceeded to Vienna, obtained with difficulty a personal interview with the emperor Francis, and gained permission to share her husband's captivity, under the hardship of which, however, her health soon became so impaired that she never fully recovered from its effects. Great exertions were now made both in Europe and America to obtain the release of Lafayette. In the house of commons Gen. Fitzpatrick, Dec. 16, 1796, made a motion in his behalf, which was supported by Col. Tarleton, who had fought against Lafayette in America, by Wilberforce, and by Fox. "The speech of the latter," says Mr. Everett, "is one of the most admirable specimens of eloquence ever heard in a deliberative assembly." President Washington wrote a letter to the emperor, asking for the liberation of his old companion in arms. The Austrian government was deaf to all entreaties. But an advocate now appeared whose plea was irresistible. Bonaparte at the head of his victorious army demanded the release of Lafayette in the preliminary conferences held at Leoben before the treaty of Campo Formio. He was often afterward heard to say that in all his negotiations with foreign powers he had never experienced so pertinacious a resistance as that which was made to this demand. The Austrian negotiators attempted to compel Lafayette to receive his freedom clogged with certain conditions; but in spite of his sufferings his spirit was unbroken, and he firmly replied that he would never accept his liberation in any way that should compromise his rights and duties, either as a Frenchman or as an American citizen. He was set free at last, Aug. 25, 1797, after an imprisonment of 5 years, 22 months of which had been shared by his wife. The unsettled condition of France yet precluded his return to his native country, and he took up his residence in Holstein, where he lived in retirement, occupying himself with agriculture, until toward the end of 1799, when he established himself at his estate of La Grange, a fine old chateau about 40 miles from Paris. Here he lived quietly, still occupied with agriculture and holding steadfastly to his republican convictions. Napoleon in a personal interview endeavored in vain to persuade him to take the post of senator. He also offered him the cross of the legion of honor, but Lafayette rejected it with disdain, calling it an absurdity. Of all the ancient nobility who returned to France, he and the young count de Vaudreuil were the only persons who refused the favors which Napoleon tendered to them. When the question was submitted to the people whether Napoleon should be first consul for life, Lafayette voted in the negative, and informed Napoleon of the fact in a letter, which put an end to their intercourse. Nothing could tempt him

from his retirement. President Jefferson offered to appoint him governor of Louisiana, then just become a territory of the United States; but he was unwilling by quitting France to appear to abandon the cause of constitutional freedom on the continent of Europe. During the Hundred Days after the return from Elba, when Napoleon granted to the people an elective house of representatives, Lafayette again appeared in public. He was chosen a representative, and took his seat in the chamber, refusing a peerage which the emperor offered him. On the first ballot for president of the house he had the highest number of votes; but he declined the honor, and exerted himself for the election of Lanjuinais. He took little part in the debates, however, till after Napoleon's return from Waterloo, when he took the lead in demanding the emperor's abdication. Lucien, the brother of Napoleon, opposed the motion to this effect in a speech of great power and eloquence. He denounced the proposition as a signal instance of inconstancy and national ingratitude. Lafayette rose, and, contrary to rule and custom, spoke from his place and not from the tribune. "The assertion which has just been uttered," he said, "is a calumny. Who shall dare to accuse the French nation of inconstancy to the emperor Napoleon? That nation has followed his bloody footsteps through the sands of Egypt and through the snows of Russia; over fifty fields of battle; in disaster as faithfully as in victory; and it is for having thus devotedly followed him that we now mourn the blood of three millions of Frenchmen." These few words made an impression on the assembly which could not be resisted; and as Lafayette ended Lucien himself bowed respectfully to him, and without resuming his speech sat down. After the entry of the allies into Paris, Lafayette returned to La Grange. Touched with a sympathy for Napoleon in his adversity which he had not felt at the height of his power, he offered to procure him the means of escaping to America; but Napoleon could not forgive his former opposition, and refused to accept his assistance. In 1818 Lafayette was elected to the chamber of deputies, where he voted constantly for all liberal measures, and opposed the censorship of the press and every thing that tended to infringe the constitutional rights of the people.—In 1824 the congress of the United States voted unanimously a resolution requesting President Monroe to invite Lafayette to visit the United States. He accepted the invitation, but declined the offer of a ship of the line for his conveyance, and with his son and secretary took passage on a packet ship from Havre for New York, where he landed Aug. 15, 1824. He was received everywhere with the utmost demonstrations of popular enthusiasm, and his progress through the country resembled a continuous triumphal procession. He visited in succession each of the 24 states and all the principal cities. "We rejoice," said Mr. Ticknor in the "North Amer-

ican Review," in Jan. 1825, "in common with the thousands who throng his steps wherever he passes, that we are permitted to offer this tribute of a gratitude and veneration, which cannot be misinterpreted, to one who suffered with our fathers for our sake; but we rejoice yet more for the moral effect it cannot fail to produce on us, both as individuals and as a people. For it is no common spectacle which is now placed before each of us for our instruction. We are permitted to see one who, by the mere force of principle, by plain and resolved integrity, has passed with perfect consistency through more remarkable extremes of fortune than any other man now alive, or perhaps any man on record. We are permitted to see one who has borne a leading and controlling part in two hemispheres, and in the two most important revolutions the world has yet seen, and has come forth from both of them without the touch of dishonor. We are permitted to see that man who first put in jeopardy his rank and fortune at home in order to serve as a volunteer in the cause of free institutions in America, and afterward hazarded his life at the bar of the national assembly, to arrest the same cause when it was tending to excess and violence. We are permitted to see the man who, after three years of unbroken political triumph, stood in the midst of half a million of his countrymen, comprehending whatever was great, wise, and powerful in the nation, with the *oriflamme* of the monarchy at his feet, and the confidence of all France following his words, as he swore on their behalf to a free constitution; and yet remained undazzled and unseduced by his vast, his irresistible popularity. We are permitted to see the man who, for the sake of the same principles to which he had thus sworn, and in less than three years afterward, was condemned to such obscure sufferings, that his very existence became doubtful to the world, and the place of his confinement was effectually hidden from the inquiries of his friends, who sent emissaries over half Europe to discover it; and yet remained unshaken and undismayed, constantly refusing all appearance of compromise with his persecutors and oppressors. We are, in short, permitted to see a man who has professed, amid glory and suffering, in triumph and in disgrace, the same principles of political freedom on both sides of the Atlantic; who has maintained the same tone, the same air, the same open confidence, amid the ruins of the Bastille, in the Champ de Mars, under the despotism of Bonaparte, and in the dungeons of Olmütz." While Lafayette was still in the country, congress, in Dec. 1824, voted him a grant of \$200,000 and a township of land, "in consideration of his important services and expenditures during the American revolution." His immense hereditary fortune had been mostly lost by confiscation during the reign of terror. On Sept. 7, 1825, he sailed from Washington in a frigate named in compliment to him the *Brandywine*. On his arrival at Havre the people assembled to make a demon-

stration in his honor, but were dispersed by the police. In Aug. 1827, he pronounced a funeral oration over the body of Manuel, a distinguished member of the chamber of deputies. In November of the same year the chamber was dissolved, and Lafayette was reelected. During the revolution of July, 1830, of which he became the acknowledged leader, he was appointed commander-in-chief of the national guards of Paris, and, though not personally engaged in the fight, his name and his experience and energy were of the greatest service to the liberal cause. His influence was successfully exerted to prevent the revolution from assuming a sanguinary character, and from proceeding to extremes which would have brought France into perilous collision with all the powers of Europe. He sacrificed his own republican preferences for the sake of peace and order, and placed Louis Philippe on the throne, "a monarchy surrounded by republican institutions." He soon resigned his commission as commander of the national guards, and confined himself to his duties as a representative of the people, and to the exercise of his moral influence as the acknowledged chief of the constitutional party on the continent of Europe. In attending in the winter and on foot the obsequies of a colleague in the chamber of deputies, he contracted a cold which settled on his lungs and caused his death. He received a magnificent funeral, and his body was buried, by his own direction, in the cemetery of Picpus in the faubourg St. Antoine.—"There have been those," says Mr. Everett, "who have denied to Lafayette the name of a great man. What is greatness? Does goodness belong to greatness and make an essential part of it? If it does, who, I would ask, of all the prominent names in history, has run through such a career, with so little reproach justly or unjustly bestowed? Are military courage and conduct the measure of greatness? Lafayette was intrusted by Washington with all kinds of service—the laborious and complicated, which required skill and patience—the perilous, that demanded nerve; and we see him keeping up a pursuit, effecting a retreat, out-manœuvring a wary adversary with a superior force, harmonizing the action of French regular troops and American militia, commanding an assault at the point of the bayonet; and all with entire success and brilliant reputation. . . . Lastly, is it any proof of greatness to be able, at the age of 78, to take the lead in a successful and bloodless revolution; to change the dynasty; to organize, exercise, and abdicate a military command of three and a half millions of men; to take up, to perform, and lay down the most momentous, delicate, and perilous duties, without passion, without hurry, and without selfishness?"—See "Eulogy on Lafayette, delivered in Faneuil Hall, Sept. 6, 1834," by Edward Everett; and *Mémoires et manuscrits de Lafayette*, published by his family (6 vols. 8vo., Paris, 1837-'8). There are also numerous biographies of him, both in French and English.

LAFFITTE, JACQUES, a French banker and statesman, born in Bayonne, Oct. 24, 1767, died in Paris, May 26, 1844. He was the son of a poor carpenter, but received a fair education. In 1788 he went to Paris, was admitted as a clerk in the banking house of Perregaux, rose to the rank of bookkeeper, and evinced such capacity for business that at the end of a few years he was offered a partnership by his employer. He at once became the leading spirit of the new firm, which through his management successfully extended the range of its operations. Such was the confidence Perregaux reposed in his integrity, that on his death he appointed him his executor. In 1809 Laffitte became one of the regents of the bank of France, and was elected a member of the tribunal of commerce in 1813; in the following year he was made president of the chamber of commerce and promoted to the governorship of the bank, which post he held for 5 years, refusing to draw the large salary attached to it. During the events of the two restorations, his liberality was equally conspicuous with his integrity; in 1814 he advanced the sum of 2,000,000 francs to the provisional government to relieve their embarrassments, and secure the pay of the French army who were to retire beyond the Loire; in 1815 he made himself responsible for the sum of 600,000 francs, exacted by Blücher as a war contribution from the city of Paris. Meanwhile he was banker of both Louis XVIII. and Napoleon, and faithfully discharged his confidential duties toward them under the most trying circumstances. When the latter finally left the capital, he placed in trust with Laffitte about 5,000,000 francs, which was afterward distributed according to his will. In 1816 the honest banker was elected to the chamber of deputies; and although he took his seat among the opposition, he was appointed member of a government committee on finance, and was instrumental in persuading the king to resist the imprudent tendencies of his adherents. In 1817 he was reelected; and in 1818, when the public credit was in danger, he prevented a commercial crisis by purchasing government stocks to the amount of several millions. While he opposed the general policy of the government, especially in 1823, when he denounced the armed intervention of the French in Spain, he never hesitated to give his support to all such measures as he thought beneficial to the people. In 1824 he separated from his political friends to uphold the conversion of the government stocks from 5 to 3 per cents., as "by alleviating the burden weighing upon the government, it was a step toward allaying the charges borne by the nation." At the same time he participated in the establishment of institutions for bettering the condition of the common people, among others of the savings bank of Paris; he opened his purse to old officers in reduced circumstances, relieved merchants on the verge of bankruptcy, and readily assisted even his political opponents. Châteaubriand,

finding himself pecuniarily embarrassed when he resigned his embassy at Rome, and having applied in vain to the royalists for assistance, received the aid he wanted from Laffitte. The political importance of the banker was increasing daily; his house became the rendezvous of the most eminent members of the opposition, either in the legislative chambers or in the public press; he was the friend of Béranger and the protector of Thiers. In 1827, when the national guard of Paris was disbanded, he moved the impeachment of the ministers. He embraced with ardor the cause of Louis Philippe, and pointed him out beforehand as the only man who could save the country in the event of a revolution. On the publication of the famous ordinances of July, 1830, he first tried to bring back Charles X. to a wiser line of policy; but his efforts being fruitless, he moved the organization of a provisional government, and when the king at last offered to repeal his obnoxious decree, it was he who uttered the sentence: "It is too late!" He now issued a proclamation in behalf of the duke of Orleans, proposed his appointment as lieutenant-general of the kingdom, and brought about a reconciliation between him and Lafayette, thus preventing the latter from proclaiming the republic; and finally he had the duke chosen king of the French by 221 deputies. He was appointed minister of state, and, assuming the ministry of finance, was intrusted with the premiership, Nov. 2, 1830. He had now reached the climax of his fortune, and his future career was unlucky. His sentiments were too liberal to suit the king, and he accordingly resigned in the following March. His banking business had suffered from his absence and the commercial difficulties consequent upon the revolution; the king had felt himself obliged to help his minister by purchasing the forest of Breteuil from him at the price of 6,000,000 francs, and authorizing the bank to lend him 13,000,000; but these transactions becoming known through the indiscretion of the king, Laffitte's credit was lost, and his exertions to prevent the fall of his firm were unavailing. He sold all his property, including his house in Paris, which however was restored to him by a national subscription, and established a new banking house under the appellation of *banque sociale*, of which he was the manager; but his anticipations of success were not realized. He reëntered also the political arena, was elected in 1837 by one of the districts of Paris, reelected in 1839 and 1842 by the city of Rouen, and at the opening of the session of 1844 presided over the chamber as its oldest member. To the last his democratic feelings were shown in his words and actions. His only daughter had married the eldest son of the illustrious Marshal Ney, the prince of Moskva; and his granddaughter, once inquiring from him the reason why, being herself a princess, her maternal grandfather was not a prince, he answered: "I am a prince, the prince of the plane; my father was a carpenter!" He died of a pulmonary disease, and more than 20,000 persons

attended his funeral. Beside some financial and political essays which have been printed, he left MS. *mémoires* which are still unpublished. *Les souvenirs de M. Lafitte racontés par lui-même*, written by Ch. Marchal, deserve little credit. There is an elegant biographical sketch of him, by Loménie, in the *Contemporains illustres*.

LAFITAU, JOSEPH FRANÇOIS, a French missionary and writer, born in Bordeaux in 1670, died there in 1740. He belonged to the society of Jesus, and was for some years attached to their missions in Canada. On his return to France, he published: *Mémoire concernant la précieuse plante ging-sang de Tartarie* (Paris, 1718), the plant here noticed, which was highly valued by the Chinese, having been found by Lafitau in the Canadian forests; *Mœurs des sauvages Américains comparées aux mœurs des premiers temps* (2 vols. 4to., 1723); *Histoire des découvertes et des conquêtes des Portugais dans le nouveau monde* (2 vols. 4to., 1738). The second is his best and most interesting work.

LAFITE. See BORDEAUX WINE.

LAFITTE, JEAN, a corsair, privateer, or smuggler of Louisiana and the gulf of Mexico, born in France, either at St. Malo, Marseilles, or Bordeaux, about 1780, died, according to some accounts, at sea in 1817, according to others, at Silan, Yucatan, in 1826. There is a singular uncertainty with regard to the events of his career. It has been stated that he never was at sea but twice—once when he came to America, and again in the voyage on which he was drowned; and that he fitted out privateers to cruise against Spanish commerce under the flag of Carthage. Other authorities assert that he began life as mate of a French East Indiaman, but, quarrelling with the captain, left his ship at Mauritius and entered upon a course of daring and successful piracy in the Indian ocean, varied by occasional ventures in the slave trade. After several years spent in these pursuits, he returned to France, disposed of his prizes, sailed for the West Indies, and took out a commission as privateer from the newly organized government of Carthage, continuing his depredations, not only upon Spanish, but upon British commerce. Another account represents him as having begun his career as lieutenant of a French privateer, which was captured by a British man-of-war and taken into an English port, where the officers and crew of the privateer were thrown into prison. Here Lafitte was confined for several years under circumstances of peculiar hardship, after all his comrades had obtained their release. The resentment toward Great Britain engendered by this real or supposed severity is stated to have been the motive that inspired his subsequent career. Unable to gratify this resentment in the service of his native country, on account of the suspension of hostilities at the time of his release, he found means of doing so under cover of a privateer's commission (against Spain) obtained from the Carthaginian government. According to this account—which bears some

indications of authenticity in its general features—the only acts of Lafitte that could properly be designated as piratical, were committed against British vessels. He is said to have gone to New Orleans in 1807; and whatever may have been the facts with regard to his early history, there is no doubt that about 1818-'14 he was at the head of an organized and formidable band of desperadoes, whose head-quarters were on the island of Grande Terre, in Barataria bay, some 80 or 40 miles west of the mouth of the Mississippi. Acting ostensibly under the flag of the republic of Carthage (or New Granada), it is generally admitted that the operations of these adventurers were not restricted within the limits to which that commission would have confined them. The bay of Barataria afforded a secure retreat for their fleet of small vessels; and their goods were smuggled into New Orleans by being conveyed in boats through an intricate labyrinth of lakes, bayous, and swamps, to a point near the Mississippi river a little above the city. After various ineffectual presentments and prosecutions before the civil tribunals, an expedition was despatched against the Baratarians, in 1814, under the command of Commodore Patterson. The settlement on Grande Terre was captured, with all the vessels that happened to be in port at the time; but Lafitte and his comrades made their escape among the swamps and bayous of the interior, from which they returned to the same rendezvous and resumed operations, as soon as Com. Patterson's forces had retired. About the same time, the British, then maturing their plans for a descent upon the southern coast of the United States, made overtures to Lafitte for the purpose of securing his coöperation in that enterprise. A brig of war was despatched to Barataria, her commander bearing a letter from Commodore Percy, commanding the British naval forces in the gulf, and one from Col. Nichols, then in command of the land forces on the coast of Florida, offering Lafitte \$30,000 and a commission in the British navy, on condition of obtaining his services in conducting the contemplated expedition to New Orleans and in distributing a certain proclamation to the inhabitants of Louisiana. Lafitte dissembled with the British officer (Capt. Lockyer, of the *Sophia*) who was the bearer of these tempting proposals, and asked for time to consider them. Meantime he immediately wrote to Gov. Claiborne of Louisiana, enclosing the documents that had been handed him by Capt. Lockyer, informing the governor of the impending invasion, pointing out the importance of the position that he occupied, and offering his services in defence of Louisiana, on the sole condition of pardon to himself and followers for the offences with which they stood charged. This amnesty would, of course, include in its provisions a brother of Jean Lafitte, who was then in prison in New Orleans under an indictment for piracy. After some hesitation on the part of the American authorities, Lafitte's offer was accepted.

In connection with an officer of the army he was employed in fortifying the passes of Baratania bay, and rendered efficient service, in command of a party of his followers, in the battle of Jan. 8, 1815. The subsequent career of Lafitte is involved in as much obscurity as his earlier life. A proclamation of President Madison confirmed the amnesty which had been granted by Gov. Claiborne to all the Baratarians who had enlisted in the American service, though it does not appear that their chief ever received any further reward from the government. We have at this time (1860) respectable living authority for believing that, after the war, he was engaged for a time as commander of a packet plying between Philadelphia and New Orleans. However this may be, it is generally understood that he soon returned to his old pursuits, taking a privateer's commission, either, as formerly, from the government of New Granada, or else from that of Mexico; and that, while thus engaged, he formed a settlement on the site of the present city of Galveston, which was broken up in 1821 by a naval force under the orders of Lieut. (now Commodore) Kearney. It is possible, however, that his brother Pierre, who commanded one of his vessels, has been confounded with him. His death is attributed by different authorities to foundering at sea, to being burned with his vessel after capture by a Spanish man-of-war, and to wounds received in a desperate conflict with a British cruiser. There are yet other versions, while one account states that he returned to France and died among his relatives on the Garonne, and that his widow was still living there a few years ago. In person Lafitte is represented as having been well formed and handsome, about 6 feet 2 inches in height, with large hazel eyes and black hair. His manners were polished and easy, though retiring; his address was winning and affable; and his influence over his followers almost absolute. There is every reason for believing that he was of a respectable family, and that his early opportunities for education had been good.—See "De Bow's Review," vols. xi., xii., xiii., xix., and xxiii.; Marbois' "Louisiana;" Latour's "War in Louisiana;" Walker's "Jackson and New Orleans;" Yoakum's "History of Texas;" and Parton's "Life of Jackson."

LA FONTAINE, JEAN DE, a French fabulist, born at Château-Thierry, July 8, 1621, died in Paris in 1695. He was the son of a magistrate, and having received an irregular education, partly at home, partly at the college of Rheims, he entered the seminary of the Oratorians with the design of becoming a priest; but at the end of 18 months he gave up this project, returned home, and led an idle and dissipated life, which gave little promise of his future celebrity. He showed however considerable poetical talent, and this was fully awakened on his hearing Malherbe's ode upon the attempt at assassination against Henry IV. recited by an officer who was garrisoned at Château-Thierry. He began eagerly to read the ancient and modern

poets and prose writers, being especially fond of Marot, Rabelais, and Queen Margaret among the French, Ariosto, Tasso, and Boccaccio among the Italians, Virgil and Terence, Homer and Plato, among the Latins and the Greeks. In order to reclaim him from his loose habits and apparent idleness, his father induced him to marry in 1647, and resigned to him his own office; but Jean was ill fitted to be either a husband or a functionary, and was equally neglectful of his matrimonial and official duties. In 1654 he published at Rheims a translation in verse, or rather an adaptation, of Terence's "Eunuch," which gave no indication of his future powers. He soon repaired to Paris, and was introduced by one of his relatives to Fouquet, the superintendent of finance, the great patron of literature and art at that time, who appointed him his poet, bestowed upon him a yearly income of 1,000 livres, and admitted him to his house. La Fontaine was thus enabled to live at his ease for 7 years, during which he produced only occasional poems of no great merit. On the fall of his protector he wrote in 1661, under the impulse of his devotion and gratitude, his admirable *Élégie aux nymphes de Vauz*, an eloquent but fruitless appeal to the king's magnanimity in behalf of the superintendent. Two years later he renewed his entreaties in his *Ode au roi*, but with no better success. He would now have been at a loss for means of livelihood, had it not been for the generosity of two noble ladies, the duchess of Bouillon, Cardinal Mazarin's youngest niece, who welcomed him at her chateau, and the duchess dowager of Orleans, from whom he received a pension as her gentleman servant; he also received occasional favors from Mme. de Montespan, and from her sister, Mme. de Thiangos; but he was always neglected by the king, who could not overlook his irregular mode of life, the character of some of his writings, and above all his fidelity to Fouquet. In 1665 he brought out the first series of his *Contes*, which presented him as a successful rival of Boccaccio; a second part appeared in 1666, and they were completed in 1671 and 1675. Notwithstanding their somewhat licentious turn, they were eagerly read even by the most respectable ladies, the standard of morality being then far different from what it now is. Meanwhile he had already published part of the work upon which his fame especially rests; the first 6 books of his *Fables* had appeared in 1668 with a dedication to the dauphin, the son of Louis XIV. and pupil of Bossuet. The following 5 books were published in 1678 and 1679, with a dedicatory epistle to Mme. de Montespan; the 12th and last, written under encouragement from the young duke of Burgundy, grandson of the king, through his preceptor Fénelon, was printed 15 years later, when the poet had reached the age of 78. His life had undergone several changes during that period of increasing fame; the death of the duchess of Orleans and the exile of the duchess of Bouillon left him unprovided for, but he received the

most generous hospitality from Mme. de la Sablière, a gifted lady, celebrated for her literary taste, who for 20 years secured him all the comforts of a home. When she died, he was fortunate enough to find at M. d'Hervart's another home, where he was cared for with equal kindness, and where he died. During the last two years of his life the religious sentiments of his early youth revived; he performed severe penances for such of his works as strict morality could not approve of, and it may be said that his end was the sage's death as depicted by himself: *Rien ne trouble sa fin; c'est le soir d'un beau jour*. He had been elected to the French academy in 1683, but was only admitted in 1684 in conjunction with Boileau the satirist. The duchess of Bouillon styled him *mon fablier*, his friends *le bon homme*, and posterity most justly proclaims him *l'inimitable*. His character presented a strange mixture of childish simplicity and finesse, which is perceptible in his poems. His freedom from all restraint and his dreamy disposition have given birth to innumerable anecdotes of his absence of mind. Beside the works mentioned above, he left *Psyché*, a mythological novel, and *Adonis*, a charming narrative poem, both of which were published in 1669 under the patronage of the duchess of Bouillon; *Philémon et Baucis* and *Les filles de Minée*, which, although intended as mere imitations of Ovid, are stamped with true originality; 4 or 5 light comedies, and two operas. The best edition of La Fontaine's complete works is that by Walckenaer (6 vols. 8vo., Paris, 1822-'7); next to it may be placed the large 8vo. volume in Didot's *Collection des classiques Français*. His select works, his fables in particular, are constantly reprinted in every form; we must content ourselves with mentioning the editions of Charles Nodier (Paris, 1818), Walckenaer (1827), Crapelet (1830), and Louandre (1852). There is an excellent *Histoire de la vie et des ouvrages de La Fontaine* by Walckenaer (3d ed., Paris, 1824). Among the English translations of La Fontaine are: the "Fables and Tales" (8vo., London, 1734); "Tales and Novels in Verse," by several hands, edited by Humphreys (2 vols. 8vo., London, 1735); "Loves of Cupid and Psyche," in verse and prose, by Lockman (8vo., London, 1744); "Fables" in verse, by Robert Thompson (4 vols. 8vo., Paris, 1806); "Fables" in verse (8vo., London, 1820); and "Fables," by Elizur Wright (2 vols. 8vo., London, 1843; 1 vol. 8vo., Boston, 1846). A new French illustrated edition of his works appeared in 1858.

LA FOURCHE INTERIOR, a S. E. parish of La., bordering on Barataria bay and intersected by Bayou La Fourche; area, 1,100 sq. m.; pop. in 1855, 12,102, of whom 5,569 were slaves. The surface is level, and the soil, except where too marshy for cultivation, is very fertile. The productions in 1855 were 819,980 bushels of Indian corn, 2,211 bbls. of rice, 27,918 of molasses, and 19,013 hhds. of sugar. Capital, Thibodeaux.

LA FUENTE, ALCANTARA MIGUEL, a Spanish historian, born in Archidona, Malaga, July 10, 1817, died in Havana in Aug. 1850. He studied law, devoted himself to historical investigations, became secretary of the cortes, and received the appointment of attorney-general (*fiscal*) in the island of Cuba. He had barely arrived in Havana before he was attacked by the local fever and died. His vast researches into the history of his country, and his appreciation of its different political phases as well as its romance, are exhibited in his "History of Granada" (4 vols., Granada, 1843-'8; 2 vols., Paris, 1851). He also wrote a work on hunting, and one on the characters and revolutions of the different races in Spain at different periods, and especially of the Moors during the middle ages.

LAGO MAGGIORE (anc. *Lacus Verbanus*), a lake of N. Italy and Switzerland, enclosed by Lombardy, Piedmont, and the canton of Ticino; length 40 m.; average breadth 2 m., greatest breadth 8 m.; greatest depth 2,625 feet; elevation of surface above the level of the sea, about 688 feet. The principal affluents are the Toce or Toccia, Maggia, and Tresa; its great outlet is the Ticino, which issues from its S. extremity at the town of Sesto. Near the entrance of the gulf of Tosa, on the W. side, lie the Borromean islands, remarkable for their picturesque beauty. The Swiss portion of this lake is termed Lago Locarno. The surrounding mountains are covered with forests, the timber of which gives rise to a considerable traffic, and employs numerous vessels on its waters. Steamers also ply regularly between Magadino and Sesto. This lake abounds in fish, particularly trout, and some are occasionally caught which are said to weigh as much as 50 lbs. There are valuable quarries of fine white marble on its shores.

LAGOS. I. A seaport town of Portugal, in the province of Algarve, 110 m. S. from Lisbon, on the N. W. shore of Lagos bay; pop. about 7,000. It is well built, and contains 8 churches, 3 convents, a civil and military hospital, an alms house, a grammar school, and a handsome aqueduct. Its inhabitants are chiefly engaged in the tunny and sardine fishery. The harbor, which is only navigable for small vessels, is defended by forts. In the bay of Lagos, Aug. 18, 1759, a British fleet under Boscawen obtained a decisive victory over a French squadron under De la Clue. II. A town of Africa on the coast of Upper Guinea, situated at the N. end of a low island, 5 m. long by 1½ m. broad, which lies at the entrance to a lagoon on the bight of Benin, near the mouth of the river Ogoon, on which, 90 m. from the coast, is the city of Abbeokoota; pop. estimated at 5,000. Lagos is nominally subject to the king of Dahomey, but tributary to Benin. A number of English and other traders reside here, and the town contains many good houses built in the English style. It was formerly a notorious seat of the slave traffic, in attempting to negotiate for the abolition of which the British consul, Mr. Beecroft, was fired upon in Nov. 1851. The town was thereupon

attacked by the British steamer *Bloodhound*, which was compelled to retire with the loss of 2 officers killed and 10 men wounded. A second engagement on Dec. 24 and 26 resulted in the reduction of the town, the capture of 57 guns, and the conclusion of a treaty by which the ruler guaranteed freedom of commerce, the protection of Christianity, and the abolition of the slave trade and of human sacrifices.

LAGRANGE, a N. E. co. of Ind., bordering on Mich., and drained by Pigeon river; area, 384 sq. m.; pop. in 1850, 8,887. It has a nearly level surface, much of which is occupied by timber. The soil is fertile. The productions in 1850 were 821,211 bushels of Indian corn, 127,905 of wheat, 73,816 of oats, and 7,203 tons of hay. There were 5 churches, 1 newspaper office, and 2,234 pupils attending public schools. Capital, Lagrange.

LAGRANGE, JOSEPH LOUIS, a French geometrician, born in Turin, Jan. 25, 1736, died in Paris, April 10, 1813. His parents were of French extraction on both sides. The reading of the ancient geometricians turned his attention to scientific pursuits; and a paper by Halley in the "Philosophical Transactions," "On the Superiority of Modern Algebra in determining the Foci of Object Glasses," led him to a close study of the analytical methods. His first publication was a letter to C. J. Fagnano, June 23, 1754, which contained a series of fluxions and fluents of different orders, somewhat resembling the binomial theorem of Newton. In 1755, although but 19 years of age, he was made professor of geometry in the royal school of artillery at Turin, where many of his pupils were his seniors. In conjunction with several of them, he established a scientific society, whose memoirs, owing particularly to his contributions, afterward acquired a high reputation, his essays on the propagation of sound being especially noticed. He meanwhile corresponded with Euler, to whom he communicated his first ideas of the solution of the isoperimetrical problems. In 1764 he won a prize from the French academy of sciences for a memoir on the libration of the moon, in which he demonstrated the wide extent of the principles of virtual velocities, and their connection with the other principles of mechanics. Soon afterward he went to Paris, where he became personally acquainted with Clairaut, D'Alembert, Condorcet, and others. In 1766 a second prize, on the subject of the satellites of Jupiter, was awarded him by the French academy; and he was invited to Berlin to become a mathematical director of the Prussian academy, which office Euler, called to St. Petersburg by the empress Catharine, had left vacant. He accepted the offer, repaired to Berlin, where he was treated with great distinction by Frederic the Great, and spent there 20 years, during which time he prepared his great work, the *Mécanique analytique*. On the death of Frederic, yielding to a secret desire and to the entreaties of Mirabeau, notwithstanding liberal offers from the courts of

Naples, Sardinia, and Tuscany, he went to France, where he was welcomed by Queen Marie Antoinette, received as a veteran pensioner of the academy an income equal to that which he had enjoyed at Berlin, and was provided with apartments in the Louvre. His *Mécanique analytique*, which had been printed under the supervision of his friend the abbé Marie and the geometrician Legendre, appeared a few months after his arrival in Paris (1787), and commanded general admiration. Being now in the zenith of his fame, he was seized with fits of morbid melancholy, during which he lost all taste for his wonted pursuits, and evinced the utmost indifference even to the work which had secured him immortal reputation. His spirits revived about the beginning of the revolution, and the treatment he received at the hands of the revolutionists was perhaps still more flattering than that which he had obtained from kings and princes. His pension was unanimously confirmed by the national assembly, and he was appointed member of a committee for examining useful inventions, and director of the mint, in conjunction with Monge and Berthollet. The latter post he resigned at the end of 6 months. He took great interest in the establishment of the new system of weights and measures. In 1793, when a decree of the convention ordered all persons not born in France to leave the country, an exception was made in favor of Lagrange. On the establishment of the normal school and of the polytechnic school, he was appointed professor in those institutions. The lectures which he delivered in 1795 were published in the *Journal de l'école polytechnique*. For his pupils he wrote his *Théorie des fonctions analytiques* (Paris, 4to., 1797 and 1813), and his *Leçons sur le calcul des fonctions* (last ed. 1806); but few of the ideas contained in these books have prevailed, as they were far from being as perfect as the method of fluxions and its kindred doctrines. On the foundation of the institute and the board of longitude, he was at once placed among the members of the former, and at the head of the latter. He was so highly appreciated in France, that, on the entrance of the French army into Turin, the generals and many high functionaries, headed by the civil commissary, went in procession, by order of the directory, to congratulate his father, then 90 years of age, on the merits of a son who "had done honor to mankind by the brilliancy of his genius, and whom Piedmont was proud to have produced, and France to possess as a citizen." Napoleon made Lagrange a senator, a count of the empire, a grand officer of the legion of honor, and a knight grand cross of the order of reunion; he showed him friendship on every occasion, and styled him the "high pyramid of mathematical sciences." His last years were devoted to preparing new editions of his *Mécanique analytique* (2 vols. 4to., 1811-'15, the publication of the 2d volume of which was completed by Prony, Lacroix, and Binet), and of his *Théorie des fonctions analytiques* (4to., 1813).

His remains were solemnly buried in the Pantheon, and the last honors were paid to his memory by Lacépède and Laplace in a funeral oration, while the emperor provided liberally for his widow and his brother.

LA GUAYRA, the principal seaport of Venezuela, on the Caribbean sea, in lat.  $10^{\circ} 86' 42''$  N., long.  $66^{\circ} 56' 30''$  W., 10 m. from Caracas; pop. about 8,000. Its situation resembles that of Santa Cruz in Tenerife. The chain of mountains which separates the town from the high valley of Caracas descends almost directly into the sea, and the town is surrounded by a wall of huge masses of rock. It contains only two streets, running parallel with each other E. and W. Commanded by the battery of Cerro Colorado, it is strongly fortified along the sea shore. The town has a gloomy and desolate aspect, and is one of the hottest places on earth. The neighboring coast is extremely unhealthy. The town has frequently suffered from earthquakes, and was almost entirely destroyed by that of 1812, when several thousand persons perished. La Guayra is rather a roadstead than a port. The anchorage is bad, the tides powerful, and the sea in constant agitation. About half of the entire trade of Venezuela and the whole of that of Caracas is carried on through La Guayra. The principal exports are coffee, cacao, cotton, sugar, indigo, and hides; and the imports are chiefly manufactured goods, flour, &c. The annual shipping comprises about 50,000 tons, and the aggregate value of imports and exports is \$6,000,000. In the 3 months ending Sept. 30, 1858, 18 vessels arrived there from the United States, with cargoes valued at over \$200,000, and 9 cleared with merchandise to the amount of nearly \$100,000.—The yellow fever which prevailed so severely at the beginning of this century at La Guayra was attributed by some authorities to the alteration caused in the atmosphere by the overflowings of the small river of the same name. Humboldt, however, on examining the bed of its torrent, found nothing that could have had any effect in deteriorating the air.

LA GUÉRONNIÈRE, LOUIS ERIENNE ARTHUR, vicomte de, a French publicist, born in 1816. The offspring of a noble family of Poitiers, known for their devotion to the Bourbons, he early gave evidence of royalist opinions, and about 1835 appeared as a writer in *L'avenir national* of Limoges. A little later he became acquainted with Lamartine, who encouraged his efforts, and on the revolution of 1848 offered him an appointment, which he declined. When Lamartine left the ministry of foreign affairs, La Guéronnière joined him in the publication of *Le bien public*, a newspaper which ceased toward the end of 1848. He then became a contributor to Émile de Girardin's *Press*, and his connection with this journal lasted about 15 months. In 1850 he edited, under the supervision of Lamartine, the new journal, *Le pays*. His leaning toward the Bonapartist party, which was plainly shown in a biographical sketch of Louis Napoleon, published in that paper with-

out his principal's approbation, caused a separation between them; and La Guéronnière became, after the *coup d'état* of Dec. 2, 1851, a staunch supporter of the new emperor. He was elected to the legislative body by the department of Cantal, and assumed at the same time the direction of both the *Constitutionnel* and the *Pays*. In 1853 he was appointed councillor of state, and subsequently commander of the legion of honor and presiding officer of the council general of Haute-Vienne. He is now superintendent of the press, and the occasional pamphlets and articles in the *Moniteur* which appear under his name are supposed to represent the imperial views and to possess a semi-official character. Such are *L'empereur Napoléon III. et l'Angleterre* (1858), *L'empereur Napoléon III. et l'Italie* (Jan. 1859), and *Le pape et le congrès*, toward the close of the same year. His flexible and somewhat pompous style is well adapted to such performances. He has also published some political sketches, *Études et portraits contemporains* (Paris, 1851 and 1856), including Napoleon III., Nicholas I., King Leopold of Belgium, the prince de Joinville, Thiers, De Morny, and Gen. Cavaignac. He is an occasional contributor to the *Revue contemporaine*, for which he wrote *Les souverains écrivains*, where Napoleon III. holds a conspicuous place between Henry IV. and Louis XIV.

LA HARPE, FRÉDÉRIC CÉSAR, a Swiss patriot, born in Rolle in 1754, died in Lausanne, March 30, 1838. He was educated in democratic opinions; began the practice of law, but disliking the profession was on the eve of going to the United States to enlist in the continental army, when he was offered and accepted a situation as preceptor of a young Russian nobleman, whom he accompanied to Italy. His success in this vocation attracted the attention of the empress Catharine, who called him to St. Petersburg and confided to his care her two grandsons, Alexander and Constantine. The republican preceptor subjected the young princes to severe training, and taught them principles and ideas which seldom find their way into courts. On the breaking out of the French revolution, he actively participated, by a petition to the government at Bern and letters addressed to the Swiss people, in the plans for reorganizing the Helvetic confederation so as to make it a single and undivided republic. This becoming known to the empress, she discharged him, without the usual pension and dignities. Leaving Russia in 1793, he repaired to Geneva, and then to Paris, where he endeavored to interest the French government in the cause of the Swiss democrats against the aristocracy of Bern, and finally succeeded in securing the protection of the directory, thus accomplishing the revolution of 1798 by which Switzerland was to become a democratic republic. He became the controlling member of the Helvetic executive directory, and wielded with energy, and even violence, the power he had acquired by force; but his hopes were soon

dispelled by the change in French policy after the 18th Brumaire. The Helvetican directory was dissolved, and La Harpe, being suspected of conspiring against the new order of things, was arrested; but he made his escape, repaired to Paris, and was told by Bonaparte that "he had better leave Switzerland alone." He then retired to private life at Plessis-Piquet, near Paris, devoting himself to agricultural pursuits, until the fall of the empire revived his hopes of his country's emancipation. In 1814, having received a visit from the emperor Alexander, he resumed his influence over the mind of his former pupil; and if he could not prevail upon him to favor his democratic plans in regard to Switzerland, he at least contributed to the preservation of that confederation, and to the liberation of his own canton of Vaud from the rule of Bern. After the treaty of Vienna he resided at Lausanne. During the most active periods of his life he published a number of pamphlets in which he expounded his plans for the reorganization of his country, and denounced the tyranny and misdeeds of its old governments.

LA HARPE, JEAN FRANÇOIS DE, a French critic, born in Paris, Nov. 20, 1739, died there, Feb. 11, 1808. He was left an orphan in his 10th year, was brought up by charity, and was admitted as a free scholar to the Harcourt college, where he gave early evidence of literary talent. On leaving this institution, he wrote with several of his comrades some satirical verses on certain members of the college, for which he was imprisoned by the police for several months. This severe punishment of a trifling offence, together with his narrow circumstances, added to his naturally bitter disposition. His first attempts at poetry were heroic epistles, a kind of poem then much in vogue. In 1768 he produced his tragedy of *Warwick*, which was successful. Three other plays of the same kind, *Timoléon*, *Pharamond*, and *Gustave Wasa*, failed; and, disappointed in his anticipations of fortune, he remained for nearly two years the guest of Voltaire. On his return to Paris in 1768, he became a contributor to the *Mercur de France*, and made himself noted for the bitterness of his criticism. At the same time he competed successfully for the academical prizes, 11 of which he won within 10 years, 8 being at the French academy. These successes procured in 1776 his election to that learned society. The new tragedies he produced about the same time were mercilessly criticized, and, with the exception of *Philoctète* (1780) and *Coriolan* (1784), were coldly received by the public. He was meanwhile the correspondent of the grand duke Paul of Russia, the son of Catharine the Great, and undertook several publications, especially an *Abrégé de l'histoire générale des voyages*, from which he realized some profit. He adopted the revolutionary principles, brought on the stage in 1791 *Mélanie, ou la religieuse*, an indirect attack on the clergy, which was warmly received, showed himself an ardent Jacobin, and went so far as to become an occasional flatterer of

Robespierre. He was nevertheless incarcerated during the reign of terror, and this made such an impression upon his mind that his opinions underwent a complete change; he became a devout Christian and an uncompromising enemy of all that was called philosophy. On his liberation after the 9th Thermidor, he resumed with great success a course of public lectures which he had begun a few years before. These lectures, collected under the title of *Lycée, ou cours de littérature ancienne et moderne* (12 vols. 8vo., 1799-1805), are still regarded as a standard of literary criticism. His *Correspondance littéraire* with the grand duke Paul was printed in 1801 (4 vols. 8vo.); and the severity and selfishness with which the judgments it contains are stamped, rekindled the hatred against him, and embittered the last years of his life.

LA HIRE, PHILIPPE DE, a French mathematician, born in Paris, March 18, 1640, died there, April 21, 1718. At first he followed the profession of painting and sculpture, which was that of his father, but while in Italy in 1660 he turned his attention to mathematics. In 1679 he and Picard were appointed to make certain surveys along the coast of Gascony; and in 1688 he was employed, in conjunction with Cassini, to complete the measurement of an arc of the meridian, which had been commenced in 1669. His most important scientific work is his *Sectiones Conicæ* (Paris, 1685).

LA HOGUE. See CAPE LA HAGUE.

LAHORE, a city of Hindostan, capital of the Punjab, situated about 1 m. from the E. bank of the Ravee, in lat. 31° 36' N., long. 74° 21' E.; pop. estimated at 95,000. It is walled with brick and defended by a citadel and outworks. There are several fine mosques, including one of red sandstone said to have been built by Aurungzebe. The Hindoos have a number of temples, and in the neighborhood are some handsome tombs, one of the most attractive of which is that of the emperor Jehanghir. The city has narrow streets, tall gloomy houses, small but well furnished bazaars, and a vernacular college supported partly by the British government, and having about 550 pupils. The surrounding country is covered with vast ruins, attesting the magnificence of the ancient city, which was the capital of the Ghaznevide dynasty in the 12th century, and the favorite residence of the descendants of Baber. The famous Runjeet Sing was invested with the rajahship of Lahore by Zeman Shah in 1799, and after his death the territory was seized by the British and consolidated with the rest of the Punjab.

LAIBAOH. See LATBAOH.

LAING, ALEXANDER GORDON, a British traveller, born in Edinburgh, Dec. 27, 1794, murdered near Timbuctoo, Africa, in Sept. 1826. He was educated for the profession of his father, who was a schoolmaster, but joined the army, and served in 1811 in Barbados as ensign under his uncle, the future Gen. Gordon. In 1820 he went to Sierra Leone, and became aide-de-camp to the governor, Sir Charles McCarthy. He

took an active part in the efforts made by the English government to stop the slave trade by commercial treaties with the natives, opened negotiations with the king of the Foolaahs at Timbo, the capital of Fouta Jallon, and contributed much to the knowledge of that country and of the upper course of the Niger. The war with the Ashantees, in which Governor McCarthy lost his life, compelled him to return to Sierra Leone. On coming back to England he was promoted to the rank of major, and placed at the head of an African exploring expedition. He sailed for Tripoli in 1825, and on July 26, 1826, joined a caravan for Timbuctoo, which he reached Aug. 18; but while on a tour to Sansanding he fell into the hands of a fanatical Arab sheik, who on his refusal to embrace Mohammedanism strangled him. He published an account of his first journey under the title of "Travels through the Timannee, Kooranko, and Soolima Countries, to the Sources of the Rokelle and Niger, in the Year 1822" (8vo., London, 1825).

LAING, MALCOLM, a Scottish historian, born at Strynzia, in the Orkneys, in 1762, died there in 1818. He was educated at the university of Edinburgh, studied law, and was called to the bar in 1784; but, not succeeding in his profession, he turned his attention to literature. His first work was a continuation of Dr. Henry's "History of Great Britain," which was followed in 1800 by a "History of Scotland from the Union of the Crowns to the Union of the Kingdoms." In 1804, a 2d edition of the latter production being called for, he appended to it an essay "On the Participation of Mary, Queen of Scots, in the Murder of Darnley." In 1807 he was returned to parliament as member for the Orkneys, but ill health soon compelled him to withdraw to private life. Beside the works above mentioned, he published an edition of the "History and Life of King James VI." from the original manuscript, which had served as the foundation of the forgeries of Crawford, in his "Memoirs of the Affairs of Scotland."—His brother, SAMUEL LAING, is known as the author of books of travel, and of works on social and political subjects. A new edition of his book on Norway appeared in 1854.

LAING, SAMUEL, a British railway financier, born in Kirkwall, Scotland, about 1810. He was educated at St. John's college, Cambridge, and in 1840 was called to the bar. Shortly afterward he became private secretary to Mr. Labouchere, then president of the board of trade, and was also for several years secretary of the railway department. In 1844 he prepared an important report on "British and Foreign Railways." In 1845 he was actively employed in preparing the reports presented by the railway commission presided over by Lord Dalhousie; and upon the rejection of them by the house of commons he resigned his seat at the board of trade and resumed the practice of his profession. In 1848 he was elected chairman of the Brighton railway company, and in 1852 was returned

to parliament for his native borough. The same year he became chairman of the crystal palace company, and was instrumental in causing the palace to be opened at Sydenham in 1854. He has also participated in the management of important lines of railway in France, Belgium, and Holland, and of the great western railway of Canada. He is known as an able and fluent speaker. In 1857 he was returned to parliament for the borough of Wick, and reelected in 1859.

LAIRESSE, GÉRARD DE, a Flemish painter, born in Liège in 1640, died in Amsterdam in 1711. At the age of 16 he was a successful painter, and received large prices for his pictures; but dissipation kept him in poverty until he removed to Amsterdam, where he rose to fortune and reputation. At the age of 50 he became blind, but he dictated his discourses on the theory and practice of painting, which were published under the title of *Groot schilderboek* (Amsterdam, 1707).

LAIS, the name of two celebrated courtesans of ancient Greece. I. The elder Lais lived during the period of the Peloponnesian war, and is generally supposed to have been a native of Corinth. She was one of the most beautiful women of her age, but remarkable for her avarice and caprice. Among her lovers was the philosopher Aristippus, who dedicated two of his works to her. She grew enamored of Eubotas of Cyrene, who promised to take her with him to his native city if he should prove victor in the Olympic games. He succeeded in the contest, and fulfilled his promise by taking thither her portrait. In her old age she became intemperate, and died at Corinth, where a monument was erected to her memory in the grove called the Oranion. II. The younger Lais was a native of Hyccara in Sicily, and lived in the age of Philip and Alexander the Great. She removed to Athens in her youth, and is said to have been induced by the painter Apelles to adopt the profession of a courtesan. She subsequently became the rival of the famous Athenian hetæra Phryne; but falling in love with a handsome Thessalian youth named Hippolochus, she accompanied him to his native country, where her beauty exciting the jealousy and envy of some of her sex, they allured her into a temple of Aphrodite, and there stoned her to death. She was buried on the banks of the Peneus; the inscription engraven on her monument is given by Athenæus.

LAKE (It. *lacca*), a pigment prepared from infusions of vegetable dyes or of cochineal, by causing the coloring matter to unite and form a precipitate with some earthy or metallic oxide. This is usually alumina, but the oxides of tin and zinc sometimes serve as the basis. A solution of alum is employed to furnish the alumina, and potash is commonly added to it—always if the infusions are acid. If the infusions are made with alkaline liquors, the alum solution may be added alone. A decoction of turmeric yields an orange lake; of cochineal, a brilliant red lake (see CARMINE); of Brazil wood, also a red,

made violet by excess of potash, and brownish by cream of tartar. Madder also gives a red lake. Persian or French berries produce yellow lakes; and green lakes may be obtained from these mixed with blue pigments. The varieties of blue pigments in use render it needless to prepare blue lakes.

LAKE, the name of 4 counties in the United States. I. A N. E. co. of Ohio, bordering on Lake Erie, and drained by Grand and Chagrin rivers; area, 220 sq. m.; pop. in 1850, 14,654. The surface is undulating and the soil a fertile clayey loam, with occasional ridges of sand. Iron ore is found. The productions in 1850 were 336,312 bushels of Indian corn, 51,744 of wheat, 151,178 of oats, 120,104 of potatoes, 25,582 tons of hay, and 142,779 lbs. of wool. There were 9 grist mills, 89 saw mills, 4 iron foundries, 1 newspaper office, 26 churches, and 8,517 pupils attending public schools. The Cleveland and Erie railroad passes through the county. Capital, Painesville. II. A N. W. co. of Ind., bordering on Lake Michigan and Illinois, bounded S. by the Kankakee river, and drained by the Calumick and Deep; area, 468 sq. m.; pop. in 1850, 8,991. The surface is level and diversified by woodlands and prairies, with large marshes near the Kankakee; the soil is generally fertile. The productions in 1850 were 188,040 bushels of Indian corn, 46,889 of wheat, 92,424 of oats, 8,949 tons of hay, and 11,526 lbs. of wool. There were 3 grist mills, 4 saw mills, 2 newspaper offices, 5 churches, and 375 pupils attending public schools. The Michigan southern and northern Indiana and the Michigan central railroads pass through the county. Capital, Crown Point. III. A N. E. co. of Ill., bordering on Lake Michigan and Wisconsin, and drained by Fox and Des Plaines rivers; area, 425 sq. m.; pop. in 1856, 17,630. The surface is chiefly an undulating prairie diversified by tracts of timber and many small lakes. The soil is a rich, deep, black loam. The productions in 1850 were 320,071 bushels of wheat, 168,915 of Indian corn, 250,733 of oats, 35,506 tons of hay, 421,900 lbs. of butter, and 45,895 of wool. There were 4 grist mills, 8 saw mills, 1 newspaper office, 8 churches, and 2,391 pupils attending public schools. Capital, Waukegan. IV. A W. co. of the lower peninsula of Michigan, drained by the Notipeskago river and affluents of the Manistee; area about 700 sq. m. It has been formed since 1850.

LAKE OF THE WOODS (Fr. *Lac des Bois*), a body of water in the Hudson's Bay territory, British North America, on the frontier of Minnesota, about lat. 49° N., long. 95° W. It is 300 m. in circumference, and has an irregular outline indented by bays. A vast number of small islands dot its surface. The Winnipeg river flows from it on the N., and it receives Rainy river on the S. Wild rice grows plentifully along its shores.

LALANDE, JOSEPH JÉRÔME LE FRANÇOIS DE, a French astronomer, born in Bourg, Franche-Comté, July 11, 1732, died in Paris, April 4,

1807. His family name was Le François, but he assumed that of Lalande at the outset of his scientific career. He was educated at the college of the Jesuits at Lyons, studied law in Paris, and was admitted to the bar, but gave up the legal profession to attend the lectures of De Lisle and Le Monnier. The latter, in 1751, procured him a scientific mission to Berlin, where he was to ascertain, through astronomical observations, the distance between the earth and the moon, while La Caille was making similar observations at the Cape of Good Hope. On his return in 1753, he was elected to the academy of sciences, assisted Clairaut in his researches on comets, especially that of Halley, and became in 1760 the editor of the *Connaissance des temps*, which he conducted until 1775, and subsequently from 1794 till his death. In 1762 he succeeded De Lisle in the chair of astronomy at the college of France, and during 46 years delivered lectures on that science. He reached the height of his fame when he published a map illustrating the two transits of Venus which were to take place in 1761 and 1769, and showing the exact time of those transits for all countries on the globe. About the same time he announced to the world the results of the calculations through which the distance between the sun and the earth had been definitely ascertained. He gave much attention to navigation, and delivered lectures and published works on this subject, which are highly valued. But the popularity acquired by his scientific labors did not satisfy his thirst for fame; and in order to keep public curiosity constantly alive, he stationed himself on the Pont-Neuf to give astronomical explanations to passers by; announced that he would travel in a balloon from Paris to Gotha, where a scientific congress was to be held; took care to have it reported that he ate spiders, caterpillars, worms, and other insects; and professed the boldest atheism.

LALLEMAND, CLAUDE FRANÇOIS, a French physician, born in Metz, Jan. 26, 1790, died in Marseilles, Aug. 25, 1854. After serving as assistant surgeon in the armies of the empire, he studied in Paris at the Hôtel Dieu under Dupuytren, and in 1819 was appointed professor of clinical surgery at Montpellier, in which office he remained till 1845, with the exception of 8 years during which he was suspended for his liberal political expressions. His most important work, the *Recherches anatomico-pathologiques sur l'encéphale et ses dépendances* (Paris, 1820-'36), remarkable for its literary merits as well as its sagacious philosophical syntheses, established his reputation, and was translated into many languages. Elected in 1845 to the academy of sciences, he removed to Paris, and was consulted by patients from every part of Europe. Ibrahim Pasha visited him in Paris, and was formally received by Louis Philippe. His health failed again after his return to Egypt, and Lallemand went to that country in 1848 for his relief, but arrived too late. He was, how-

ever, received with distinction by Mehemet Ali. He is the author of valuable works, and bequeathed 50,000 francs to the institute.

LALLY, THOMAS ARTHUR, count, baron of Tullendally or Tollendal in Ireland, a French soldier, born in Romans, Dauphiné, in Jan. 1702, beheaded in Paris, May 9, 1766. He was the son of Sir Gerard Lally, an Irish loyalist, who had accompanied James II. in his exile to France. He was educated to the profession of arms, and when scarcely 12 years old performed his first military service at the siege of Barcelona. For his gallantry at the siege of Kehl in 1733 and Philippsburg in 1734, where he saved his father's life, he was promoted to the rank of major. In 1737 he visited England, Ireland, and Scotland, with a view to promote the interests of the pretender; and in 1738 he was sent on a secret mission to St. Petersburg. In 1745 he distinguished himself at the battle of Fontenoy, where he led the Irish brigade whose gallantry secured victory to the French. The king promoted him to the rank of brigadier-general on the field. The same year, at the head of a body of volunteers, he landed in Scotland, joined the young pretender Charles Edward, served as his aide-de-camp at the battle of Falkirk, went twice to London, where a price had been set upon his head, barely escaped with his life, fell into the hands of smugglers, and owed his safety to his self-possession and daring. In 1755, being consulted by the French ministry upon the best mode of impairing the power of England, he strongly urged an attack upon her East Indian possessions. He was offered the command of an expedition to carry out his own plan, received the appointment of governor-general of the French establishments in the East, and sailed for his destination, May 2, 1757. But the means which had been placed at his disposal were wholly inadequate. He landed at Pondicherry, April 28, 1758, and found that the agents of the French East India company were secretly against him. Nevertheless, the Coromandel coast was conquered in a few weeks. He overcame all the obstacles thrown in his way, laid siege to Madras in the month of December, carried the Black Town, and had some prospect of success; but being unsupported by D'Aché, the commander of the French fleet, and having no money to pay his mutinous soldiers, he was finally obliged to retire on the arrival of an English fleet. Soon after he found himself besieged in Pondicherry by an enemy 10 times his superior in numbers. He held out for 10 months; but deserted by his fleet, betrayed by the agents of the French company, having exhausted his resources, and the garrison being reduced to 700 men, he was finally compelled to surrender at discretion, Jan. 14, 1761, to Gen. Coote, who had 22,000 troops under his command, and was supported by 14 ships. He was taken prisoner to London; but having heard that he was charged by his personal enemies with various crimes, he obtained his release on parole, re-

paired to Paris, and, conscious of his own innocence, voluntarily entered the Bastille, in order to hasten his trial, but was left there for 19 months without examination. Being finally accused as a traitor and a defaulter by the very men who had been the cause of his ruin, a mock trial took place; witnesses of the worst character, some of whom were his own servants, were admitted to testify against him; he was refused counsel, and was not even allowed to present his defence; and at last, after a protracted secret deliberation, he was sentenced to death and executed. Several years afterward, the whole of these proceedings were revised; and the sentence was finally reversed in 1778.

LALLY-TOLLENDAL, TROPHIME GÉRARD, marquis de, a French politician, son of the preceding, born in Paris, March 5, 1751, died March 11, 1830. Although of legitimate birth, he was brought up, under the name of Trophime, in ignorance of his parentage until the eve of his father's execution. He first made himself known by his untiring efforts, during 12 years, to procure the reversal of his father's sentence, in which he secured the assistance of Voltaire, who wrote in his behalf. In 1789 he was one of the deputies of the nobles to the states-general; he supported moderate reforms, and favored the establishment of a constitutional monarchy with two chambers and an absolute power of veto vested in the king; but on the return of Louis XVI. to Paris, Oct. 6, he was so alarmed at the course of the revolutionists that he retired with Mounier to Coppet in Switzerland. There, under the title of *Quintus Capitolinus avus Romains*, he published in 1790 a pamphlet censuring the proceedings of the constituent assembly. He returned to Paris in 1792 to oppose the Jacobins, and was imprisoned, but escaped a few days previous to the September massacre and fled to England. In 1798 he applied to the convention to be appointed one of the counsel of King Louis XVI., but his request was not answered. He returned to France after the 18th Brumaire, and lived in retirement until the return of the Bourbons, when he was made a peer.

LAMA. See LLAMA.

LAMAISM (Tungusic, *Lam*, ocean; Thibetan, *Lama*, road, a priest), the prevailing religion of Thibet and some other parts of Asia. It is an offshoot of Buddhism, with some tenets of Sivaism, engrafted on the ancient Thibetan religion, and on Mongolic Shamanism or spirit worship, the last traces of which yet exist in Siberia, as a species of demonolatry, marked by the practice of magic and many cruel customs. The Thibetans call their religion *Saangas r-Gyass-Kyu-tchoss*, or Buddha's law. Many of its features are described in the article **Buddhism** (vol. iv., especially on pp. 68 and 69).—The history of the introduction of Buddhism into the snowy fastnesses of Thibet is imperfectly known. The Thibetan and Chinese annals relate, that the first religious king, who is said to have lived after some other fabulous monarchs, and who is known as Sarong b-Tsan

e-Gam-po, the upright wise prince, after the transfer of his residence from the banks of the Yalung-kiang or eastern branch of the Yang-tse-kiang, and after a war with the Chinese, having married a Chinese and a Nepanlese princess, received from their fathers many books and idols of Buddha, and built temples for the keeping of the latter. These were the nucleus of the city of Lassa (*Lha-sa*, god-land), the metropolis of Lamaism. In A. D. 632 he sent his minister Thumi-Ssam-bho-ta to study Buddhism in Nepal, and to adapt the Devanagari to the Thibetan language. The king translated the three principal sacred books into Thibetan. On account of this, and on account of the good laws he made, he received the title of *Chakra-vartin*, or the wheel-turner. To him also is attributed the introduction of the omnipotent mystic formula of the 6 syllables *Aum ma-ni pad-me hum*, which probably means: "God! treasure in (the) lotus, Amen!" (see BRAHMA, vol. iii. p. 617); it is moreover a greeting to Avalokitesvara, the patron saint of Thibet, one of its 3 Bodhisattvas; and also a spiritual and corporeal panacea, and a universal prayer. Another saintly king of the 9th century, the son of a Chinese princess, built a great monastery 8 days' journey S. E. from Lassa, and completed, by the aid of Indian pundits, the translation of the *ba'djur* (pronounced *Ka-djur*, *versio verbi*), the great canon in 8 sections, containing 1,088 works, in 100 volumes, and treating of discipline, metaphysics, the appearance of Buddhas, religious treasures, the Nirvana (see BUDDHISM, vol. iv. p. 66), and of magic formulas. The 8d incarnate king, Khri De Serong bTsan, built many cenobies by the aid of holy men from India and Nepal, and founded the Lamaic hierarchy toward the end of the 9th century. He was, however, put to death by strangling, and many discontented Thibetans emigrated. Buddhism was rent by the sects of the Chinese and Indian schools, and was almost uprooted by King gLang-dar-ma, who was therefore called a Khublighan of Shienus (*incarnatio diaboli*). His two sons divided the Thibetan kingdom into U (Chinese, *Uei*, pure, holy), the eastern portion, with Lassa as its capital, and Tsang or the centre, the south-western portion, having as its metropolis *gShies-Ka-rTse* or Dzigtarchi. Further civil broils compelled many to emigrate to Nga-ri, in the north-west, as well as into Kham, the original seats of the Thibetans, on the borders of Szuchuan, under Chinese protection. This did not avail much, as China was then weak, and was moreover separated from Thibet by the new state of the Hia or Tangut (Chinese, *Si-fan*), near the Koko-Nor, or Blue Lake. Buddhism was reimported from Kham, and Indians were invited into Nga-ri. Djo-bo-Atisha reorganized it, and his Thibetan disciple Brom-bakshi founded a moral sect, from which issued the great reformer who will be spoken of below. New monasteries were erected in the 11th and 12th centuries, of which the principal were Ra-

sgreng, N. of Lassa; Ssa-skya, S. of Dzigtarchi, the seat of the lama primate of that period; Bri-gung, 4 days' journey N. E. from Lassa, the seat of an anti-primate.—The glory of Lamaism dates from the conversion of the Mongols. Their ancient religion was Shamanic, consisting in the belief in *Tegri* (sky, god) and demons, in the souls of ancestors, and the like. Genghis Khan despised all priests, being indifferent to all creeds, as were his sons. But after the division of the Mongol empire into several powerful states, Batu Khan adopted Islamism, Khulaghu favored Christianity, while Kublai Khan (1259-'94), the conqueror of China, and founder of the Yu-en dynasty, became a Buddhist. An admirer of Chinese civilization, and a patron of learned men, he found it useful to acquire power in Thibet, which had been only partly conquered by Mangu Khan, by affording protection to the hereditary lama of Ssa-skya. He divided the country into districts, and subjected them (1298) to this lama, who bore the names of *Ti-szu*, emperor's teacher, *Ta-pao-fa-vang*, great precious law's king, *Gromgon*, protector of beings, and other titles from his contrivance of letters for the Mongolic language. This lama consecrated Kublai as emperor, and wrought many wonders; and on his demanding a higher throne than that of the emperor, the empress decided that he should have it only while performing sacred rites, and should sit as high as the emperor on all other occasions. Kublai and the *Ti-szu* compared the *Ka-djur* with the Chinese copy and with the collection of the Kin dynasty. This concordant canon was printed in 1285-1806, with the assistance of Thibetan, Uiguric, Chinese, and Sanscrit scholars. The same emperor founded convents in Peking and in southern Mongolia; he restored the temples at U-tai; he surrendered the palaces of the Sung dynasty to the lamas; and he sent an embassy to Ceylon, which brought him the Bhikshu bowl, two molar teeth, and a miraculous image of Sakyamuni. This religious zeal was carried to its highest pitch by the successors of Kublai, so that many Chinese pretended to be monks, in order to escape the payment of taxes and the performance of other duties. About 500,000 such impostors are reported to have been expelled from the cloisters in a single province. After a rule of 89 years, the Mongol dynasty was expelled from China by a native priest of Fo, who founded the Ming dynasty (1368-1647). Among the successors of the great lama of Ssa-skya the most noteworthy were Sang-ko, his brother, and Tasi, a Bodhisattva (1847). They succeeded each other by natural inheritance, and not by incarnation. The Ming dynasty, desirous of maintaining Chinese supremacy in Thibet, divided the power of the hereditary primate. Tai-tsu conferred equal dignities and titles upon 4 lamas (1878). Tshing-tsu (1408-'25) appointed 8 lamas with the title of *tang* (king) to be subordinate to the *Ta-pao-fa-vang*, Garma, who was not of the native primate family. A great reformation was

wrought in Lamaism by the lama Sonkapa, who was immaculately conceived by his mother's falling on a Buddhist inscription, in a mountain gorge in Amdo, not far from the Koko-Nor (1855). He was born with a white beard and with the power of speech, and from his hair was produced a tree with leaves bearing sacred Thibetan inscriptions. After many wonderful performances, he betook himself to Lassa, both for the sake of learning, and at the same time of teaching incomparably more. On being invited to appear before the primate of Ssa-skya, he remained in his cell, so that the great man was obliged to go to him. The high red cap of the protector of beings was knocked down by the low ceiling; and on his speaking haughtily, he received the reply: "Wretch, I hear the sigh of the creature thou art murdering." The primate at this rebuke fell upon his knees, for he was caught in crushing an insect, thus breaking the first of the 10 essential ordinances of the Sramanas. (See *Buddhism*, vol. iv. p. 68.) This Tangutan monk taught with great renown at Lassa (1407-'9), and introduced many improvements. Though he ascended to heaven in 1419, his body is preserved floating in the air in the monastery of dGa'-lDan, which he founded. He is the author of the sect *dGe-lugs-pa* (of virtue), and of many books, especially of the *Lama-nim tshen-po* ("Great Road to Perfection"), and is considered as the incarnation of Mahakala (great time), often reborn and to be reborn; and he is represented in painting between both the highest lamas, with a lotus flower in each hand. The lamp festival is kept in his memory. These two lamas, equal in sanctity, and reciprocal consecrators of one another, have adopted the yellow cap and the views of the reformer. Both bear the title of *Rin-po-tsho* (great reward); the superior in power is the Dalai lama (Mongolic, ocean-priest); he resides in Lassa. The second is the most reverend *Pan-tshen* (pundit great), precious jewel; he resides in bKra-shiss Lhun-po (out of which Turner made Teshoo-Loomboo), near Dzigartchi.—Each Buddhist soul is in process of being reborn, as long as it is yet stained by sin; but only a sinless saint can be *khubilghan* or incarnated. Both supreme lamas, the highest orders of other lamas, and the Chinese emperors are capable of incarnation. Although the theory of renavity is founded in that of metempsychosis, and seems to have been developed in India before the 7th Christian century, and although that of incarnation is redolent of Sivaism, the credulity of the Thibetans has developed both theories into the existing *Khubilghanism*, which reached its present completeness in the 15th century. The Dalai is especially an incarnation of the above mentioned Avalokitesvara, as the Pan-tshen is of the so called contemplating Buddha, one of whose incarnations was the great reformer. The restorer of Buddhism in Thibet and his disciple Brom, both incarnate, are the prototypes of the double papacy. The reformer was incarnated as Pan-tshen some

10 times, while there have been about 14 incarnations of the Dalai. According to Osoma de Kôrô, the first Dalai lama was *dGe-h Dun grub-pa* (perfect priest), born in 1389, died in 1478. He was the builder of many monasteries, the principal of which is that of Lhun-po. The second was *dGe-h Dun rGyam-Tho* (perfect ocean), 1474–1540, who introduced an administrator of temporalities, a sort of *major domus*, called *uDe-pa* (head director), and who was in vain invited to visit Peking. The third, *bSod-namer Gya-m-Tho* (virtue-ocean), 1541–'87, brought the Mongols, who had strayed away and had partly relapsed into Shamanism, back into the Lamaic fold, by visiting Altan Khakhan (Altan king of kings), who had ravaged Thibet, and by converting him into a strong pillar of the church. A concordat between the two powers stipulated that all animals, instead of being sacrificed, should be given to the lamas; that these should be divided into 4 classes, coordinate with the 4 classes of the Mongolic nobility; that both these orders should be free from taxes and from military service. The khakhan now formally approved the title of Dalai with the epithet of *Vadgradara* (thunderbolt-holder), receiving himself, in return, that of *Chakravartin* (wheel-turner). At the same time it was decreed that a patriarchal cathedral should be erected at Kuku-kho-tun (blue city), between the Tumed and Ordos tribes, whose *Khutukhtu* or vicar should be the 2d Mongolic patriarch. Having lengthened the life of Altan by one year, the Dalai inaugurated his son as his successor, on his second visit to Mongolia. The emperor of China, alarmed at this alliance between the church and the Mongols, endeavored to regain his influence over the former by granting it new favors.—*Yon-tan rGya-m-Tho* (merit-ocean), incarnated as a Mongol prince, was inaugurated by the Pan-tshen at Lassa (1601), and held the thunderbolt during 14 years. His vicar, named "Thought-Ocean," reigned among the Khalkas, and afterward in the great monastery of Kuren, on the Tula river, as next in dignity to both lamas. The 5th Dalai, *Ngag dBang bLo bSang rGya-m-Tho* (wise-speaker ocean), 1615–'80, played a double part between the western Mongols and the emperors of China. About 1580 one *Tsho-vang rNam rGyal* (faith-king victor), pretending to be a descendant of a king, fled to Ladakh, whence he conquered a part of Thibet, thus threatening the power of the lamas, abetted probably by the people, while the Mongols favored the tyranny of the priesthood. Between 1588 and 1680, during a sort of interregnum, the *Khutukhtu* set on foot many intrigues for the benefit of the Pan-tshen. Under the Ming dynasty Lamaism was shorn of many advantages in China, and also lost the imperial support in Thibet. The Tungusic power founded by Aishin Ghioro, being countenanced by the Mongols on account of their respect toward the lamas, conquered China (1644), and became the 20th dynasty, called Ta-tsing. Tskung-tshi restored the privileges of the Lamaic church, at the request of the

Dalai (1686). Khang-hi, availing himself of Lamaic diplomacy, settled the quarrels among the Khalkas (1686) and annexed them to the Chinese empire. He had more difficulty with the Oelöths who had driven them eastward, and whose Galdan-khan, in secret league with the major-domo at Lassa, resisted the Chinese armies for about 16 years, until his power was broken. During these troubles the regent concealed the death of the 5th Dalai for 16 years, appointing in the mean time two pseudo-Dalais. The 6th Dalai lama of approved incarnation ruled from 1706 to about 1756. In 1750 the Chinese garrison was massacred at Lassa, and the regal power was taken from the Dalai. The Pan-tahhen visited Peking in 1779. Beside the violent death of 8 Dalai lamas while yet mere youths, there is little that is noteworthy concerning the other incarnates.—In the popular belief, the Dalai lama, as an incarnation of Buddha-Sakyamuni, is an eternal, omniscient divinity. When officiating, he sits cross-legged and statue-like on 5 magnificent cushions over the altar, dressed in splendid robes, noticing nobody, and moving only his hands to bless his worshippers. Sometimes he distributes balls made of paste, clay, and sacred materials, which are of infinite efficacy. Every thing that belongs to or comes from him, even the most offensive matters, is all-powerful. His immense income from lands, mines, flocks, and offerings, is increased by the sale of holy textures, fumigations, relics of saints, and idols. All other lamas share, in proportion to their authority, in the privileges of the ocean-priest. The doctrine of incarnation was modified at the close of the 18th century. The Dalai sometimes points out his successor, while at other times the books are consulted for that purpose. The emperor of China now determines the incarnation, although, to save appearances, the name of the future incumbent is solemnly drawn by lot from among 8 candidates.—The whole hierarchic scale consists of the following rounds: novice, deacon, *geslong* (virtue beggar), universal doctor, master of religion, abbot, *Khubilghan* (incarnate), *Khutukhtu* (vicar), Pan-tahhen, and Dalai. The 4 last are all incarnations, although some *Khutukhtus* are appointed by a diploma, on account of their learning. The non-incarnate lamas are employed in various lower duties, both ecclesiastical and secular. All lamas are monks. All live in monasteries, each in his own cell, without a common refectory. The centre of a lamasery is occupied by the *Lha-khang* (god-house, temple), which is surrounded by the dwellings of officers, schools, and cells. Some establishments also contain schools of magic. There are few *Gal-pos*, or hermits who live in caves. Vagabond lamas are numerous, and among the Mongols near the great wall some of them tend the imperial flocks. Female lamas are called sisters-in-law, venerable aunts, &c. The disciplinary canon contains 253 rules, in 5 classes. Novices are received at the age of 7 to 15; the second consecration takes place be-

tween the ages of 15 and 20, and the final consecration after the age of 20.—Representations of some of the dresses, ceremonies, &c., of the lamas may be seen in Pallas, *Sammlung historischer Nachrichten über die Mongolischen Völkerschaften* (St. Petersburg, 1801). Beside the *Ka-djur* mentioned above, there is a greater collection of treatises in 225 volumes, elegantly printed at Peking, containing translations from Sanscrit and Prakrit, on dogmas, philosophy, grammar, medicine, and ethics, with Amara's *kosha* or vocabulary, and fragments of the Mahabharata and of other epic poems. The work of the great reformer, the history of Buddhism, lives of saints, and all sorts of works on theology and magic, fill the libraries. But the Tibetans also possess annals, genealogies, and laws, as for instance the "Mirror of Kings" (translated into Mongolic by Ssanang Seetse, and into German by Schmidt), or *Bodhi-imör* ("Way to Wisdom"), and works on astronomy and chronology. The most renowned among the Lamaic schools is that of the Lha-brang of Lassa.—The Lamaic temples are of Indo-Chinese form, square, fronting the east in Thibet and the south in Mongolia. They are often cruciform. There are 3 gates, and 8 interior divisions, viz., the entrance hall, the body of the edifice with 2 parallel rows of columns, and the sanctuary with the throne of the high lama. There are numerous statues, paintings of gods, ornaments, and implements of all sorts, many of which display superior workmanship, especially those by Nepalese artificers; *tha-khangs* (paste-houses) or chapels; *r Dahods* or stupas; *manis* (gems), or walls and columns with inscribed prayers, frequently consisting of the 6 mystic syllables only, but sometimes extremely long; and *Dar-po tshe* (silks great), or poles bearing flags with prayers. Prayer wheels, the turning of which is supposed to be quite as efficacious as vocal supplication, are seen everywhere. Festival days, ceremonies, and pageants of all kinds, varied with the performances of magicians, as well as fasts, sacraments, and noisy music, animate the zeal of the faithful. Dead lamas are commonly embalmed and preserved in pyramids. The bodies of rich laymen are burned and their ashes preserved; while those of the common people are either exposed to be devoured by birds, or eaten by sacred dogs, which are kept for the purpose, and the bones are pounded in mortars and given to the animals in the shape of balls. Rich persons about to die are assisted by lamas, who let out the soul by pulling the skin from the skull and making a hole in it. Religious services for departed souls are said in the ratio of payment received. The mode of the funeral is determined by astrology. Since the restoration of the power of the Dalai by the emperor K'ian-lung, all the decrees of government are issued in the name of each of the two high lamas, in their respective dioceses; but the real power is in the hands of the emperor, whose two *Ta-tchin* (great mandarins) reside at Lassa, with Chinese garrisons in

the neighborhood, to watch both the ocean of holiness and the *Tsang-vang*, who as vicar of the emperor administers the affairs of the country. The lower offices only are hereditary. The annual tribute of the two high lamas is carried every third year to Peking by caravans.—The principal holy place in Thibet is Lassa, with the monasteries *Lha-brang*, the cathedral; *Ra-mo-tahhe* (circuit great), wherein is the Chinese idol of Fo; and *Moru* (pure), having a celebrated printing office. Near the city is *Gar-ma khian* (mother-cloister), wherein bad spirits are personated, and about a mile distant a three-pointed hill with the chief of all monasteries and palaces, called *Potala* (Buddha's mount), occupied by about 10,000 lamas in various dwellings. Several fine parks and gardens adorn the environs of the holy city. Among the 30 great lamaseries in the neighborhood are *Sse-ra* (golden), on the road to Mongolia, with Buddha's sceptre floating in the air, and 15,000 lamas; '*Brass as Pungus* (branch-heap), founded by the reformer, with a Mongolic school, 800 sorcerers, and 15,000 lamas; and *dGa'iDan* (joy of heaven), also built by the reformer, whose body sometimes converses with the 8,000 lamas. On the road to Ssu-tchuan is *Lha-ri* (god mountain), with a fine temple; there is another sacred place in the metropolis of Kham; others at Tshha-mDo (two ways), Djaya, &c., with printing offices; many others on the roads to Peking, beside the northern monastery; all containing an incredible number of monks, under Khutukhtus, and lower lamas; so that Father Hue counts 8,000 monasteries in U alone; others 84,000 monks in U, Tsang, and Kham, of the yellow sect; hermits, beggars, and vagabonds not included. About 120 miles S. W. from Lassa, near the confluence of the Painom with the great *gTsang-po-tshu* (Sanpu), is the 2d metropolis of Lamaism, viz., *bKra-Shiss-Lhun-po* (mount of grace), also called *bLa-brang*, with 5 great cenobies, many temples, palaces, mausoleums, pyramids, and the like. In the neighboring city there is a Chinese garrison. About midway between the two *bLa-brangs*, there are 8 rocky islands in a lake, called *gYang-brog* (happy desert, Yambro on English maps), which contain temples, a magnificent palace, and thousands of monks and nuns, subject to the *rDo-rDje-Phag-mo* (saint or adamantine sow), a female Khutukhtu, who becomes incarnated with a figure of a sow's snout on her neck, in consequence of her having escaped from Lassa during the troubles of the regency in the shape of that animal. The Chinese believe her to be the incarnate *Ursa Major*. On the road to Nepal there are the *sNar-thang* monastery, where the *Ka-djur* was printed; and *Seaskya*, mentioned above, now the see of the red-capped *Gong-rDogas* (high lord) *Rin-po-tshhe*, who is hereditary. On the road to Bhotan are the monasteries *Kisoo* and *Gautum* *Goomba* of Turner, and many others, swarming with lamas, some filled with *Annis* (nuns).—Bhotan is subject to the Dalai; but there are also three red-capped *Rin-po-tshhe*. The metropolis is *bKra-*

*Shiss Tahoss rDeong* (*gloria salutis fidelique ara*, Turner's Tassiusdon), under an incarnate great lama and a secular *Dharma-rajah*, who rules over 6 districts, with about 10,000 lamas amid 45,000 families. In Sikkim the aboriginal *Leptchas* have many mendicant lamas who practise magic, the other tribes being pure Buddhists. Buddhism flourished in Nepal as early as the 7th century of our era. It now exists there with Brahminism and Mohammedanism; so that Nepal has also a double literature. In Kunawar and elsewhere on the upper Sutlej there are many great monasteries of both the yellow and the red caps, living in peace with each other. At Sunnam there is a great library, a printing establishment, and a gigantic statue of Buddha. Ladakh became Buddhist before our era; its history is even less known than that of Thibet. Although invaded by Moslems (about 1650), it has many lamas both male and female. In China there are two Buddhistic sects, viz., that of Fo, since A. D. 65, fostered by the government, very numerous, but without hierarchy, each monastery being under an abbot who is a citizen of the 12th class; and the Lamaists, organized as in Thibet, under the ministry of foreign affairs, with 3 Khutukhtus at Peking, one of whom is attached to the court, while another's diocese is in South Mongolia, and the third governs the central one of their great monasteries. The most celebrated temples in the 18 provinces are one on the U-tai-shan (6-topped mountain) in Shan-si, and one in Yunnan. In Si-fan or Tangut, about the Koko-Nor, Lamaism flourished under the Hia at the close of the 9th century. The great cenoby of *saKubum* was visited and endowed by Khang-hi, and has a celebrated university. Mongolia is the paradise of lamas, they forming about  $\frac{1}{4}$  of its population. Its patriarch, the *Gegen-Khutukhtu*, a *Boddhisattva* of *Maitreya*, is equal in rank to both Thibetan popes, resides at Urga, on the road between Peking and Kiachta, lat.  $48^{\circ} 20'$ , with about 20,000 monks, and has attained the highest *Khubilghanism* by 16 incarnations, having been first the son of Altan Khakhan of the Khalkas, and having once died (1889) after a visit to Peking, either by poison or from licentiousness. The Urgan cenoby owns about 80,000 families of slaves. The cathedral at Kuku Khotun, among the *Tumed*, is under an incarnate patriarch, now second to the preceding. Most cenobies and temples now extant in Mongolia were built or restored after the second conversion. A Khutukhtu rules over the celebrated establishment of the "five towers." Dyo Naiman Suma, the summer residence of the 2d Peking Khutukhtu, contains 108 temples and a famous manufactory of idols. Many other abodes of lamas are scarcely inferior to those we have mentioned. The desert of Gobi contains many such establishments. Sungaria contains numerous ruins of Lamaism, on the Irtysh and elsewhere, among which those of Ablai-Kiit, near Usk-Kamenogorsk, are most

renowned, because the first fragments of the holy canon were brought thence to Europe, about 1750. The Torguts have built many sacred places since their return from the west. A few lamas were found among the Buryäts (in Russia) near Lake Baikal about 160 years ago, as missionaries from Urga. Now almost all of them south of the lake are Lamao-Shamanites, and have wooden temples. The Calmucks between the Don, Volga, and Ural are forbidden to maintain intercourse with the Dalai, although they keep up a Lamaic worship in Shitani-urgas (church tents).—See Osoma de Körös, "Asiatic Researches," &c.; Hue, *Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine* (Paris, 1852); Carl Ritter, *Erkunde von Asien*; K. Fr. Koepfen, *Lamaische Hierarchie*, &c. (Berlin, 1859).

LAMANTIN. See MANATEE.

LAMAR, a N. E. co. of Texas, separated from the Indian territory by Red river, and drained by Sulphur fork of that stream; area, 1,015 sq. m.; pop. in 1858, 6,999, of whom 1,778 were slaves. It has an uneven surface diversified by woodlands and fertile prairies and suitable for grazing. The productions in 1850 were 116,596 bushels of Indian corn, 22,762 of oats, 101,976 lbs. of butter, and 1,055 bales of cotton. There were 6 grist mills, 6 saw mills, and 1 newspaper office. Capital, Paris.

LAMAR, MIRABEAU B., 2d president of the republic of Texas, born in Louisville, Ga., Aug. 16, 1798, died in Richmond, Texas, Dec. 19, 1859. After being employed a number of years in mercantile business and farming, he established in 1828 the "Columbus Inquirer," a journal devoted to the defence of state rights, and was actively engaged in politics until his removal in 1835 to Texas. Arriving there at the outbreak of the revolution, he at once sided with the party in favor of independence, and participated in the battle of San Jacinto, to the successful issue of which the charge of the cavalry under his command greatly contributed. He was soon after called into the cabinet of Gov. Smith as attorney-general, a position which he subsequently exchanged for that of secretary of war. In 1836 he was elected the first vice-president of Texas, having for some months previous held the rank of major-general in the army. In 1838 he was elected president, in which office he remained until 1841. Upon the breaking out of war between Mexico and the United States in 1846, he joined Gen. Taylor at Matamoras, and fought at the battle of Monterey. He subsequently stationed himself with an armed force at Laredo, where for two years he was engaged in constant conflicts with the Comanches, whose depredations on the frontier he greatly curtailed. The last public position which he held was that of U. S. minister to Nicaragua and Costa Rica, from which he had but lately returned when he died. He is the author of a volume of poems entitled "Verses Memorials" (New York, 1857).

LAMARCK, JEAN BAPTISTE PIERRE ANTOINE DE MOINET DE, a French naturalist,

born in Bazentin, Picardy, Aug. 1, 1744, died in Paris, Dec. 18, 1829. He was educated at the Jesuits' college at Amiens with a view of entering the church; but at the age of 17 he suddenly relinquished his studies, and, entering the army, fought under the duke de Broglie in the 7 years' war, until incapacitated by ill health for military duty. He subsequently studied medicine and the physical sciences in Paris, and in 1776 commenced his career as an author by the publication of his *Mémoire sur les vapeurs de l'atmosphère*. In 1778, having previously given much attention to the study of botany, he published his *Flora Française*, containing a new arrangement of plants which was commended by Buffon and the academy of sciences. About the same time he accompanied the younger Buffon on a tour through Germany and Holland to procure botanical specimens; and he became also a companion in the botanical excursions of J. J. Rousseau. Being appointed editor of the botanical department of Panckoucke's *Encyclopédie méthodique*, the results of his researches were embodied in that work. The outbreak of the French revolution interrupted it and terminated De Lamarck's botanical labors. In 1798, although he had previously given comparatively little attention to zoology, he was intrusted with the department of invertebrata in the museum of natural history in Paris. This branch of natural history became thenceforth the absorbing study of his life, and his lectures upon it, commenced in 1794, were continued until the failure of his eyesight in 1818 incapacitated him for the duty. His first important work on this subject, *Système des animaux sans vertèbres* (1801), was the forerunner of a more elaborate treatise published many years later. In 1809 appeared his *Philosophie zoologique* (2 vols. 8vo.), in which a fanciful theory of the development of animal functions, previously hinted at in an early work, is developed at considerable length. It was his opinion that new organs could be produced in animals by the simple exertion of the will, called into action by the creation of new wants; and that the organs thus acquired could be transmitted by generation. In support of this doctrine, which is called appetency, he cited the existence of tentacula on the head of the snail, which derive their origin from the desire of the animal, united with endeavor perpetuated and imperceptibly working its effect through a series of generations, to possess organs capable of examining the bodies it encounters; and the same thing, he asserted, had happened "to all races of gasteropods, in which necessity has induced the habit of touching bodies with some part of their head." This theory has however never been adopted by naturalists. In 1815-'22 appeared De Lamarck's chief work, *Histoire naturelle des animaux sans vertèbres* (7 vols. 8vo.), by far the most comprehensive treatise on the invertebrata which had appeared, and of which the edition of 1834-'45, with notes by Deshayes and Milne-Edwards,

is a standard manual on the subject. His division of the animal kingdom includes 3 groups, the apathetic, the sensible, and the intelligent. The 1st comprises *infusoria*, *polyparia*, *radia-ria*, and *vermes*; the 2d, *insecta*, *arachnida*, *crustacea*, *annelida*, *cirripeda*, and *mollusca*; and the 3d, *pisces*, *reptilia*, *aves*, and *mammifera*. Some of his statements respecting the habits and functions of the apathetic animals have been disproved by the researches of Ehrenberg and later naturalists. His last work was his *Mémoires sur les coquilles*, published in the *Annales du muséum*, in which he was assisted by Valenciennes, and by his daughter Mlle. de Lamarck.

**LAMARMORA, ALFONSO DE**, marquis, a Sardinian general and statesman, born Nov. 17, 1804. He was admitted to the military academy of Turin in 1816, and left it in 1823 with the rank of lieutenant of artillery. He took an active part in introducing reforms into the organization of the army, and in the war against Austria in 1848. In 1855 he was commander of the Sardinian forces in the Crimean campaign. He has officiated on several occasions as minister of war and marine. He continues to hold this position (1860), having presided for some time over the ministerial council before Count Cavour's resumption of the post of prime minister of Sardinia.

**LAMARQUE, MAXIMILIEN**, count, a French soldier and political orator, born in St. Sever, July 22, 1770, died in Paris, June 1, 1832. He enlisted in the army in 1791, was sent to Spain, reached the rank of captain, and joined the corps styled the *colonne infernale* under the command of Latour d'Auvergne. In 1794, at the head of 200 soldiers, he stormed Fuentes de Oropesa, for which he was rewarded by promotion to the rank of adjutant-general, and a decree of the convention declared that "he had merited well of his country." After the peace with Spain, he served under Dessolles and Moreau on the Rhine, distinguished himself at Hohenlinden, and was made a brigadier-general in 1801. He afterward joined the army under Napoleon, and participated in the battle of Austerlitz. He shared in the invasion of Naples, was present at the taking of Gaëta in 1806, smothered the insurrection in Calabria, and worsted some British detachments in 1807. In the same year he was made general of division, and under Joachim Murat, who had succeeded Joseph Bonaparte as king of Naples, undertook in 1808 to capture the island and fortress of Capri, which was defended by the English garrison under Sir Hudson Lowe. He accomplished his purpose in a manner which secured him universal admiration. The army of Italy having joined the grand army on the Danube, Lamarque distinguished himself at Wagram, where he had 4 horses killed under him. Being afterward sent to Spain, he led the rear guard when the French evacuated the Peninsula. He felt little sympathy for the first restoration; and Count Blacas congratulating him upon the rest

he would now be able to enjoy, he replied: "We do not call this rest, but a halt in the mud." On the return from Elba, Napoleon appointed him to the command of Paris, and sent him to the west, where he succeeded in suppressing the royalist insurrections. On the second restoration he was exiled and retired to Amsterdam, where he devoted his time to literature, art, and the education of his son. In 1818 he was allowed to return to France, and settled in his native town. In 1828 he was elected to the chamber of deputies by the department of Landes, and took his seat among the opposition. He was one of the 221 members who voted against the elder branch of the Bourbons; but being dissatisfied with the policy of Louis Philippe's government, he opposed the ministry, and, turning his special attention to foreign affairs, bitterly denounced the system known as that of *la paix à tout prix*. His honesty of purpose, sincerity, and martial eloquence gained him great popularity. His funeral, which took place June 5, 1882, was attended by a large crowd of citizens; and the republicans took advantage of the circumstance to raise a formidable insurrection in the most populous districts of Paris. The whole army in Paris and the national guard marched against the insurgents, who yielded after nearly 48 hours of bloodshed.

**LAMARTINE, ALPHONSE DE**, a French poet and statesman, born in Mâcon, Oct. 21, 1792. His father, the chevalier de Lamartine de Prat, was captain in a regiment of cavalry at the outbreak of the revolution; fought with the Swiss guards in defence of the throne against the insurgents on Aug. 10, 1792; passed the reign of terror in prison; and, on the fall of Robespierre, retired with his wife and child to the village of Milly, near Mâcon. There the genius of the poet began to develop in domestic serenity, under a mother's discipline, with a small library, including Fénelon, Bernardin de St. Pierre, the abridged and profusely illustrated Bible of Royaumont, and a translation of Tasso's *Gerusalemme liberata*, which books were his first masters, and opened to him "the world of emotion, and love, and revery." In his 12th year he was sent to study Latin under a neighboring priest, a sportsman as well as ecclesiastic, whose adventurous life afterward furnished the subject of *Jocelyn*. He was soon transferred to the college of Lyons, and again to the school of the Jesuits at Belley, whence he returned in 1809 to Milly. Abandoning his classical studies, in which he had taken little interest, he read the modern poets, Dante, Petrarch, Shakespeare, Milton, Chateaubriand, and, above all others, Ossian, whom even in his mature years he esteemed superior to Homer and the rival of Dante. His *Confidences* relate his attachment at this time to a rustic maiden, who was his neighbor, to divert him from which his parents sent him to Paris, whence in 1811 he accompanied one of his relatives to Italy. Pursuing his journey alone, he passed a studious and contemplative winter at Rome in the house of an

old painter, and in the spring went to Naples, where he had the company of his dearest school-fellow, and in various adventures and meditations along the borders of the bay cultivated the sentiments and filled his imagination with the pictures which were to enrich his poems. Recalled to France near the close of the empire, a royalist by the tradition of his family, and cherishing against the imperial régime the hatred which afterward inspired the preface of his *Méditations*, he entered the body guards in 1814, and on the escape of Napoleon from Elba accompanied the royal family to the frontier, and passed the Hundred Days in Switzerland and Savoy. He returned to the capital after the second restoration, and was introduced to the family of Count de Maistre, whose peculiar opinions gave a more spiritual character to his thoughts. Several years were thus devoted to revery, pleasure, travels, and serious studies in Paris, where he meditated dramas and wrote numerous elegiac pieces, some of which he occasionally recited with applause in the salons of Mme. de Saint Aulaire and of the duchess de Broglie, then centres of elegance and taste. In the elegy of the *Lac*, written on one of his visits to the valley of Aix in 1817, he first displayed the genius of a great poet. The death of a friend, his own illness, and his relations with the distinguished families which led the religious reaction of the restoration, had given a sombre cast to his thoughts, which appears in this melodious elegiac expression of the rapid flight of time, and the contrast between the permanence of nature and the instability of human things. His first published collection appeared in 1820 under the title of *Méditations poétiques*, which was received with universal admiration, recalling Châteaubriand's *Génie du Christianisme* by its success as well as by its religious fervor. Within 4 years 45,000 copies were sold. At this time Béranger and Lamartine divided the poetic world, reigning with nearly equal authority. The songs of the former charmed the senses, celebrating youth, pleasure, wine, and glory; the elegies of the latter, marked by a touching melancholy, appealed especially to the young men and women of the aristocracy, enthusiastically devoted to the work of Catholic restoration, and delighting in the contemplation of nature and the ceremonies of worship. This work opened to the author a diplomatic career, and he became secretary to the embassy at Naples. On his way he married at Geneva Miss Birch, a young English lady of a wealthy family, who had received a brilliant literary and artistic education, and who brought as a double dowry her enthusiasm and her riches. He resided at Naples, Rome, or Paris, till in 1823 he published his *Nouvelles méditations*, which, though it contains more of his finest pieces than any other collection, as the *Ode sur Bonaparte*, *Les étoiles*, *Sapho*, *Le chant d'amour*, and *Le poète mourant*, was less popular than his previous volume. It was followed by his *Dernier chant de Childe Harold* (1825), an imitation

of Byron, containing an admirable but severe tirade on Italy, which was answered in an insulting pamphlet by Col. Pepe, an Italian revolutionist. The result was a hostile meeting between the poet and the patriot at Florence, in which the former was wounded. He returned to Paris after a residence of 5 years in Florence, declined to enter the ministry of Polignac, was received into the French academy, and published his *Harmonies poétiques et religieuses* (1830), which gave new proof of his luxuriant genius, and in which, as was said, the throne and the altar found their most brilliant and earnest defender. He had been appointed minister plenipotentiary to Greece previous to the revolution of July, 1830, upon the accomplishment of which, on account of his attachment to the fallen dynasty, he renounced diplomacy and rejected the advances of the new monarchy. A political pamphlet in 1831 proves, however, that he shared neither the hopes nor the antipathies of the legitimist party, and that he vaguely regarded the new government as a stage of transition. Perceiving that the age demanded action and not regrets "for the past which is now but a dream," that all ought to enter the ranks of citizens, and think, speak, and combat for the public weal, he offered himself successively at Toulon and Dunkirk as a candidate for the chamber of deputies. His double failure was the occasion of an attack by the poet Barthélemy, to which he published a reply admirable for its dignity and good taste and its poetical power. In 1832 he undertook a journey to the East, which had been the religious and romantic dream of his life. He set sail from Marseilles, with his wife and daughter, in a vessel chartered and furnished by himself, having a library, an arsenal, and princely presents for the chiefs of the countries which he was to visit. The French emir, as the Arabs called him, travelled like a sovereign, buying houses at which to tarry, and having whole caravans of horses in his service. Leaving his family at Beyroot, he pursued his way alone toward Jerusalem. In traversing the chain of the Lebanon he was warmly received by Lady Hester Stanhope, the visionary queen of Palmyra, who prophesied impending calamities in Europe and a distinguished political career for himself. By lavish expenditures and the protection of Ibrahim Pasha he reached Jerusalem in safety, where he learned the death of his daughter at Beyroot. He returned after 16 months by way of Constantinople and the valley of the Danube, and published his *Voyage en Orient, souvenirs, impressions, pensées et paysages* (4 vols., 1835), a splendid though sometimes careless mingling of religion, history, philosophy, politics, and poetry. During his absence the electors of Bergues, Nord, had elected him deputy, and he entered the chamber two months after his arrival in France, appearing for the first time in the tribune, Jan. 4, 1834. "I return to France," he said, "to bring my stone for the modern edifice, if indeed it be

given to our generation to found any thing." Though he acted with no political party, his eloquence, if not his statesmanship, gave him distinction, and many who doubted the aptitude of the poet for material questions admired in his discourses the language of poetry applied to affairs, and his imposing treatment of the most positive interests of government from the point of view of the noblest sentiments. But from his political isolation, he occupied the public for several years less as a deputy than by his new writings. In 1836 appeared *Jocelyn*, a poem of love and duty, announced as a journal found in a village curacy, and as an episode or fragment of a vast poem of humanity which was to embrace all ages of nature and forms of civilization. It is one of his finest productions, combining dramatic movement with lyric fervor, and pictures of the conflicts of society, the storms of passion, the temptations and catastrophes of life, with glances at the eternal problems of philosophy. "A great silence," says Jules Janin, "was made around that book." It was only after a little hesitation that the most cultivated readers and critics received it as a model of the only epopee possible to our time. Two years later followed *La chute d'un ange*, a poem of the antediluvian era, in which the author revels in the mysteries of primitive humanity and in the strangest fancies of the Orient. Its negligences and extravagances justified the coldness with which it was received. Similar defects appeared in his *Recueils poétiques* (1839). Having formed the habit of improvising all his verses, their beauties were only occasional and hardly more than happy accidents. In the preface to this collection he declared it to be his duty and purpose from that time to make poetry the vassal of politics in his career. As an orator he made remarkable progress in the chamber. His speeches on the eastern question, on the abolition of the death penalty, on the protection of literary property, and on various projects of social improvement, delighted the deputies without commanding their votes, and were eagerly read through the country. At once conservative and progressive, he stood between the ministry and the opposition, assailing the inflexibility of the one and the violence of the other. He defended the administration of Molé (1837-'9) against the powerful coalition of Thiers, Berryer, Guizot, and Garnier-Pagès, and was at the same time the head of what was called the "social party." This small but subsequently powerful clique, avoiding purely political questions, and mingling St. Simonian with evangelical ideas, sought the universal progress of the nation by "legislating Christianity." After the formation of a new ministry (May 12, 1839), he opposed Villemain, Thiers, and Guizot in the important discussion on the eastern question, his intimate acquaintance with the subject and his pictorial delineations of its romantic aspects giving additional force to his arguments. Regarding the fall of the Ottoman empire as imminent, he

proposed a vast European colonization of Asia, an organization of the Orient into provinces under the protection of the great powers of Europe, and recommended a congress of these powers to settle the conditions in advance. He separated again from the cabinet, and foreshadowed his ultimate adherence to the liberal side, by contending in 1842 that the regency should be conferred on the duchess of Orleans by a vote of the chamber, thus asserting the principle of the national sovereignty. Declaring that the July monarchy had no great and directing idea, he soon broke definitively with what he termed the "party of limitations," and opposed the ministry of Guizot not only in the chamber, but finally also by addresses at the reform banquets. He already anticipated the subversion of the throne, to which he powerfully contributed by his *Histoire des Girondins* (8 vols., Paris, 1847), a magnificent historical picture gallery, in which the heroes of the first revolution appear in the most attractive colors. After the abdication of the king and the escape of the royal family, in the last assembly of the chamber (Feb. 24, 1848), where the duchess of Orleans appeared with her eldest son, the count of Paris, whom it was attempted to declare king by acclamation, and where an armed and tumultuous crowd overlooked the proceedings, the eloquence of Lamartine decided the establishment of a provisional government, which he was among the first to propose. The irruption of new bands of insurgents increased the confusion, amid which he vainly attempted to read the list of names for the government which he had chosen from the various parties. The list was completed at the Hôtel de Ville, whither he had repaired followed by an immense throng, and was announced by him to the populace. On the following morning (Feb. 25) the insurgent and famishing crowds, which had just sacked the Tuileries, appeared before the Hôtel de Ville, threatening destruction if they were not immediately supplied with bread and work. Ories of *Le drapeau rouge* (the red flag), the symbol of terror, were already heard, when Lamartine advanced alone into the midst of the infuriated mob, and gained his greatest triumph of eloquence. To his intrepid stand on this occasion, while the most violent of those about him were trying to level their muskets at him, it is mainly to be attributed that the republic did not pass immediately into a new reign of terror. He took the department of foreign affairs in the government, and one of his first acts was to address a pacific circular to the ministers of foreign states, in which the design of forcible revolutionary propagandism was disavowed. His unrivalled fame and eloquence and his rare courage gave him also a predominance in the general direction of affairs. He opposed the radicalism of his colleague Ledru-Rollin, and his popularity was proved by his election to the national assembly (April 23) from 11 departments, without having expressed a wish to be a candidate. He was received with

acclamations in the street, the audience rose to greet him at the opera, and constant applause interrupted him when he made his report to the assembly of his administration. The first place in the executive commission, which was to succeed the provisional government till the formation and acceptance of a constitution, seemed destined for him, when he fatally compromised his popularity by a coalition with Ledru-Rollin, urging even that the latter should be appointed on the committee, since he deemed him less formidable in the government than in opposition. The result was, that instead of being the first he was the fourth on the list. His voice failed of its accustomed effect when he was sent for to address the insurgents of May 15. After striving to prevent the insurrection of June, and after fighting in person against the insurgents, he perceived that the time demanded not reason but the sword, favored the dictatorship of Gen. Cavaignac, and resigned his own executive office. In the debate on the constitution he supported the plan which was adopted of vesting the power of legislation in one chamber, the president of which should be the chief magistrate of the republic. Though ably supported for the presidency by Pelletan and La Guéronnière in the *Pays* newspaper, he received but 19,900 votes, and he was returned to the assembly in 1849 only by one obscure department. He did not recover his leading position in that body, and he retired from public life after the *coup d'état* of Dec. 2, 1851. For several years his private affairs had demanded much of his attention. From the time of his oriental tour, the income of his writings and diminished fortune, and the illusive wealth of large territorial grants by the sultan, had been unequal to the expenditures incident to his elegant mode of life. He condemned himself therefore to indefatigable literary labors in the production of numerous works, often of ephemeral importance. His principal later publications are: *Trois mois au pouvoir* (1848); *Histoire de la révolution de 1848* (2 vols., 1849); *Confidences and Raphael* (1849), memoirs of his youth; *Toussaint L'Ouverture* (1850), a drama; *Geneviève* (1851); *Le tailleur de pierre de Saint Point* (1851); *Histoire de la restauration* (6 vols., 1851-8); *Visions* (1852), a poetic fragment; *Nouveau voyage en Orient* (1858); *Histoire des constituants* (4 vols., 1854); *Histoire de la Turquie* (6 vols., 1854); *Histoire de la Russie* (2 vols., 1855); and the periodicals *Le conseiller du peuple* (1849-52), *Le civilisateur* (1852-6), and the *Cours familier de littérature* (1856 et seq.). His friends opened a subscription in 1858 in his favor, but with unsatisfactory results. The municipality of Paris presented him in 1860 with a country seat near the Bois de Boulogne. Among the best editions of his collected works are the *Œuvres choisies et épurées* (14 vols., 1849-50).

LAMB, CHARLES, one of the most peculiar and delightful of English authors, born in London, Feb. 10, 1775, died in Edmonton, Dec. 27, 1834. His father, originally from Lincolnshire,

was servant and friend to one of the benchers of the Inner Temple. While performing his humble duties with assiduity, he was not without literary ambition, and published a volume of occasional verses which evince his humor and taste. His character is happily drawn under the name of Lovel in the essay of Elia on "The Old Benchers of the Inner Temple": "He was a man of an incorrigible and losing honesty; had a face as gay as Garrick's, whom he was said greatly to resemble; moulded heads in clay or plaster of Paris to admiration, by the dint of natural genius merely; had the merriest quips and conceits; was altogether as brimful of rogueries and inventions as you could desire; and just such a free, hearty, honest companion as Mr. Izaak Walton would have chosen to go a fishing with." In the Inner Temple Charles passed the first 7 years of his life, and was then sent to the school of Christ's hospital, where he remained till his 15th year. Of delicate frame, and constitutionally timid, though his sweetness of disposition made him a favorite, he was wont to steal along among his boisterous companions "with all the self-concentration of a young monk." Samuel Taylor Coleridge was his schoolfellow, and one of his earliest and most esteemed friends. But for a slight impediment in his speech, causing a hesitancy which became one of the charms of his conversation, and which unfitted him for the clerical profession, he might have passed from school to the university; and the reluctance with which he accepted a different fortune appears from the fondness with which in after life he regarded the two ancient seats of learning in England, and the delight with which he often passed his vacations in their neighborhood. He was employed in the South sea house from 1789 to 1792, when he obtained an appointment in the accountant's office of the East India company, which he held with a gradually increasing salary until his retirement with a pension in 1825. To meetings with Coleridge on his visits to London from Cambridge, when they used to sup together at an inn, and sit in conversation nearly through the night, he attributed the first quickening of his intellect to literary activity, saying in a letter to him: "You first kindled in me, if not the power, yet the love of poetry, and beauty, and kindness." A calamity which gave an impress to his life occurred in the latter part of 1796. There was a tendency to insanity in his family. He himself at the age of 20 was confined 6 weeks in a madhouse. "Many a vagary," he says, "my imagination played with me, enough to make a volume, if all were told." He was not again affected, but the tendency was more strongly marked in his sister Mary. On Sept. 22 she killed her mother in a paroxysm of madness, and Charles was at hand only in time to snatch the knife from her grasp. From this time her life was an intermittent insanity. She always had premonition of the recurrence of her disorder, and would herself indicate the moment when her brother should take her to the asy-

lum, where she would remain until her restoration. He devoted himself only to her, and admitted no connection which could interfere with his single care to sustain and comfort her. His first compositions were in verse, written slowly and at long intervals. His earliest printed poems are contained in a volume published conjointly with Coleridge and Charles Lloyd in 1797, and republished only in conjunction with Lloyd in 1798. In that year he produced also his prose tale of "Rosamund Gray;" was associated with Coleridge and Southey in preparing a volume of fugitive poetry under the title of the "Annual Anthology," which was ridiculed by Canning in the "Anti-Jacobin;" and was engaged in writing the tragedy of "John Woodvil," which was rejected by the managers, and soon after its publication in 1801 received a bantering notice from the "Edinburgh Review" as a specimen of the rudest condition of the drama, the work of "a man of the age of Thespis." He made one other dramatic attempt, "Mr. H.," a pleasant farce, which, although unfitted by its trivial plot for the stage, was produced at Drury Lane theatre in 1806 with Mr. Elliston in the principal character. It was damned on the first night, and Lamb, who sat with his sister in the front of the pit, gave way to the common feeling, hissed and hooted as loudly as any one, and henceforth made a jest of the wreck of his dramatic hopes. He had already begun his studies of the old English authors, whom he always preferred to later writers with one or two exceptions, and published in 1808 his "Specimens of English Dramatic Poets who lived about the Time of Shakespeare," with appreciative and suggestive notes, which was more favorably received than his preceding works. To the "Reflector," a quarterly magazine established by Leigh Hunt in 1810, he contributed some of his finest pieces, as the essay "On Garrick and Acting," which contains his character of Lear, the "Essays on Hogarth," and the "Farewell to Tobacco." His celebrity as an author and the circle of his literary friends had greatly increased when the establishment of the "London Magazine" in 1820 occasioned the compositions by which he acquired his most brilliant reputation, the "Essays of Elia," first collected in 1823, to which the "Last Essays of Elia" were added in 1833. In 1825 occurred one of the principal events of his uneventful life, his retirement from his clerkship. His salary had then become £700 per year, and he was allowed a life annuity of £450. Great consideration had uniformly been shown him by his superiors. So highly did he value the independence thus obtained by drudgery, that he advised one of his friends rather to seek five consolatory minutes between the desk and the bed, or even to throw himself "from the steep Tarpeian rock, slapdash, headlong upon iron spikes," than to rely solely upon literary labor for support. His exultation on his release appears in his letters: "I came home forever on Tuesday in last week.

The incomprehensibleness of my condition overwhelmed me. It was like passing from life into eternity." The interesting circle of friends of which he formed the centre, and his social qualities, are quite as important in his biography as his writings. Coleridge, Lloyd, Southey, Godwin, Manning, Wordsworth, George Dyer, Hazlitt, Talfourd, Bernard Barton, Leigh Hunt, Cary, Procter, De Quincey, and Hood were among those who shared his intimacy. Many of these were wont to meet at the Wednesday evening parties of Charles and Mary Lamb in his chambers in Inner Temple lane, which would occupy a large space in a literary history of his epoch, and which his biographer elaborately compares with the evenings of Holland house. Lamb presided over the motley group, stammering out puns, witticisms, and fine remarks, while his countenance is described as presenting a sort of quivering sweetness, "deep thought striving with humor, the lines of suffering wreathed into cordial mirth;" and his whole appearance resembled his own characterization of another person, "a compound of the Jew, the gentleman, and the angel." Though many of his curious sayings have been recorded, it is affirmed that they give no idea of the singular traits, the verbal felicities, and happy thoughts of his conversation. His single frailty was the eagerness with which from an early period of life he would quaff exciting liquors, snatching a fearful pleasure "between the acts of his distressful drama." He made a final abandonment of tobacco, though he had learned to smoke the strongest preparations of the weed, affirming to Dr. Parr that he had toiled after this power as some men toil after virtue. His large intellectual tolerance, cherishing among his intimate associates men of every variety of philosophical, religious, and political opinions, has rarely been equalled. He delighted especially in individual peculiarities and oddities, and in all striking displays of human nature. During the last 6 years of his life he resided with his sister successively at Islington, Enfield, and Edmonton, often visiting his old associates in London, heavily afflicted by the deaths of Coleridge and Hazlitt, and with little disposition to write any thing but verses and essays that were given to his friends. While taking his daily morning walk he accidentally fell, slightly wounding his face, and erysipelas ensued, which terminated fatally. In his last moments, when nearly insensible to things around him, his mind seemed intent on hospitable purposes, and he proposed in broken sentences some meeting of his friends. Beneath all his inconsistencies, his fantastic ideas, subtle perceptions, absurd fancies, and mingling of jest with seriousness, the most constant and prominent feature of his character was amiability. With a giant sorrow ever impending over him, he seems to have been at every moment genial, loving, appreciative, whimsical, thoughtful, and sad. The "Essays of Elia," his best literary bequest, hold a peculiar place in English literature, which contains few things so exquisite.

The style is a model of quaint and graceful elaboration, showing both his original genius and his familiarity with the fine sayings of the Elizabethan age; and they abound as well in profound thoughts as the rarest fancies and felicities of expression. His works were edited, with a biography consisting largely of his letters, which are among the most delightful in the language, by Thomas Noon Talfourd (1 vol. 8vo., London, 1840; 4 vols., 1850; with addition of the "Final Memorials," 1 vol., 1852; 4 vols., 1855). The "Specimens of English Dramatic Poets," and other writings of his, are not included. The "Essays of Elia" have been published separately (Boston, 1860).—MARY ANNE, sister of the preceding, an English authoress, born in London in 1765, died in St. John's Wood, May, 20, 1847. She resided constantly with her brother until his death, except when the occasionally recurring fits of her insanity obliged her removal to the asylum until she recovered. She wrote a few slight poems, and in conjunction with him the "Tales from Shakespeare" (1807), and a collection of tales entitled "Mrs. Leicester's School" (1808). The stories by her are, as Charles delighted to insist, the best of the collection. When well, she was remarkable for the sweetness and pliancy of her disposition, and was said by Hazlitt to be the only thoroughly reasonable woman he had ever met. On Charles Lamb's death the East India company granted to her the pension to which a widow was entitled, and her brother had beside made her comfortable secure by his own savings.

LAMBALLE, MARIE THÉRÈSE LOUISE DE SAVOIR-CARIGNAN, princess of, born in Turin, Sept. 8, 1748, murdered at the prison of La Force in Paris, Sept. 8, 1792. She was early remarked for her intelligence, sweetness of temper, and personal beauty. In 1767 she was married to the prince of Lamballe, son of the duke of Bourbon-Penthièvre. This union was not happy, and the princess was about to seek a separation when her husband died, May 7, 1768. On the death of Marie Leszcynska and Mme. de Pompadour, a marriage was proposed between her and Louis XV.; but the project was defeated by Choiseul and his adherents. When Marie Antoinette came to France, she conceived a strong attachment for the princess, and on her accession to the throne appointed her superintendent of the royal household. The princess in return proved a devoted friend. She saw without jealousy the growing favor of the duchess of Polignac, and silently kept aloof; but when the latter, on the breaking out of the revolution, deserted her mistress, she returned to her post. She was at the queen's side on the dreadful days of June 20 and Aug. 10, 1792, and accompanied her to the legislative assembly and afterward to the Temple. On Aug. 19 she was separated from her mistress and confined in the prison of La Force, where, despite the most energetic measures to save her, she fell a victim to the September massacre. When she appeared before the tribunal which passed sentence upon

the prisoners, she answered with firmness and dignity. She refused to take the oath against the king, the queen, and monarchy; and scarcely had the verdict, "Out with her," been uttered, when she was struck down with a billet by a drummer boy and despatched with the sword. A butcher boy cut off her head; her body was stripped naked and exposed to the crowd; her heart was torn out and placed with her head on a pike, and these bloody trophies were carried first to the Palais Royal, where the duke of Orleans, her brother-in-law, was forced to salute them, and then to the Temple, where they were paraded under the windows of the queen. The *Mémoires relatifs à la famille royale de France* (2 vols. 8vo., Paris, 1826), gathered from her conversations and memoranda, were published by Mrs. C. Hyde, the marchioness Solari; but their authenticity has been questioned.

LAMBERT, DANIEL, an English giant, born in Leicester, March 18, 1770, died in Stamford, June 21, 1809. Neither his parents, brother, nor sisters were of unusual size, but an uncle and an aunt were remarkable for corpulency. In his youth he excelled in strength, was fond of field sports and other athletic exercises, but gave no indications that he should attain excessive bulk till his 19th year. He soon after succeeded his father as keeper of the prison in Leicester, and his rapid increase in size from that time he attributed to his confinement and sedentary life. In 1793, when he weighed 448 lbs., he walked from Woolwich to London with less fatigue than several other men in his party. He was noted as a swimmer, and could float with two men of ordinary size on his back. When his office was abolished in 1805, an annuity of £50 was settled on him in acknowledgment of the universal satisfaction he had given. Being incommoded by the curiosity of numerous visitors from the adjacent country, he decided in 1806 to exhibit himself in London. His apartments in Piccadilly became almost a place of fashionable resort, and his visitors were received with politeness, and treated him in the most respectful manner. Among the foreigners who went to witness the spectacle was the Polish dwarf Count Borowlaski. He remained 5 months in the metropolis, and afterward exhibited himself in the principal towns of England. He was 5 feet 11 inches in height, and at his death he weighed 789 lbs. He measured 9 feet 4 inches round the body, and 3 feet 1 inch round the leg. He never drank any beverage but water, slept regularly less than 8 hours per day, was healthy, active, and vivacious through life, and took part in all the sports of the field till within a few years of his death.

LAMBERT, JOHANN HEINRICH, a German philosopher and mathematician, born in Mülhausen, Aug. 29, 1728, died in Berlin, Sept. 25, 1777. He belonged to a poor Huguenot family driven from France by the revocation of the edict of Nantes, and was chiefly self-educated. His first occupation was that of a copying clerk. At the age of 17 he became secretary to the

editor of a newspaper at Basel, and while acting in this capacity had an opportunity of making himself acquainted with the works of Wolf, Locke, and Malebranche. In 1748 he removed to Coire, in Switzerland, and became private tutor in the family of Count Peter de Salis, then president of the confederation. In 1756-'8 he visited Holland, France, and Italy with his pupils. While in Holland he published his first book, *Sur les propriétés remarquables de la route de la lumière*, &c., which at once gave him a high rank as a mathematician. In 1759 he resigned his tutorship, and removed to Angsburg, but, having been appointed to determine the boundaries between the country of the Grisons and the Milanese, he returned to Coire in 1761, and sojourned there till 1768. In 1764 he went to Berlin, and was made a member of the royal academy of sciences; in 1770 he was appointed superior councillor of the board of works; and in 1774 was intrusted with the superintendence of the "Astronomical Almanac." He was regarded as the most analytical writer on scientific subjects of his day. Among his most important works are: *Insigniores Orbis Cometarum Proprietates*; *Novum Organum*, a metaphysical treatise in the Aristotelian style; and *Beiträge zum Gebrauche der Mathematik und deren Anwendung*, a series of mathematical essays.

LAMBERT, JOHN, an English parliamentary general, born in Kirkby-Malhamdale, in the west riding of Yorkshire, Sept. 7, 1619, died in the island of Guernsey in 1692. He was educated for the bar, but at the outbreak of the civil war entered the parliamentary army as a captain under Fairfax, and participated in the principal engagements in England and Scotland until the final overthrow of the royalists at the battle of Worcester, Sept. 8, 1651, at which time he held the rank of major-general. He was instrumental in procuring the recognition of Cromwell as protector, and took his seat in the first parliament called by him. But upon the assumption by Cromwell in 1657 of sovereign power, and his inauguration with the solemnities applicable to monarchs, he refused to take the required oath of allegiance and retired in displeasure from public life. After the death of Cromwell he associated himself with the general council of officers of the army, and aided in deposing Richard Cromwell, even venturing, on the credit of his military reputation, to aspire to the position of protector. As a leader of the fifth monarchy men and extreme republicans, he was prominent in procuring the return in May, 1659, of the remnant of the long parliament called the "rump;" and upon the rising of the royalists in Chester in August of the same year he promptly marched thither and defeated them. This success however excited the jealousy of parliament, and on a flimsy pretext Lambert with other officers was cashiered; whereupon the former with a body of soldiers dispersed the members, Oct. 13, and a committee of safety appointed by the army, of which Lambert was the controlling spirit, began to exercise the functions

of government. His position at this time was of so much importance that it was considered not unlikely, in the event of his own schemes of sovereignty proving impracticable, he might make terms with Charles II.; and some of the adherents of the latter went so far as to recommend him to secure the services of Lambert by marrying his daughter. Meanwhile Monk commenced his march from Scotland for the purpose of restoring parliament. Lambert at the head of 7,000 men started to oppose him; but his troops deserted in great numbers, and in Jan. 1660, he was seized by order of parliament, which had reassembled during his absence, and committed to the tower. Monk's design to restore the monarchy being now manifest, the hopes of the republicans began again to centre in Lambert, who, escaping from the tower in April, put himself at the head of a body of troops in Warwickshire. His men again deserted him, and he was recaptured by Col. Ingoldsby and conveyed to the tower. Having been excepted from the bill of indemnity after the restoration, he was tried in 1662 in the court of king's bench with Sir Harry Vane, and convicted. Unlike Vane, he was reprieved at the bar and banished to Guernsey, where he devoted the rest of his life to botany and flower painting. He is said to have died a Roman Catholic.

LAMBESSA, or LAMBESSE, a French penal colony in the Algerine province of Constantine, founded in 1848. The number of criminal prisoners amounted in 1856 to nearly 800. Of political offenders there were about 300 who had taken part in the insurrection of June, 1848, and almost 2,000 were transported in 1852. A French commander resides in the place, and is supported by a body of officers and soldiers. Lambessa contains a church, a hospital, a post office, and various other public buildings, the principal of which is the prison, built at a cost of \$350,000. The prisoners are permitted to work at their former trades; half of the proceeds of their labor is given to them at once, and the remainder when they are set free. The neighboring country is well adapted for agriculture and fruit growing, but is not yet much cultivated.—Lambessa occupies the site of the ancient Lambese or Lambassa, which was one of the most important cities in the interior of Numidia, belonging to the Massylii. Under the Romans an entire legion was stationed here, and among its interesting ruins are the remains of an amphitheatre, a temple of Æsculapius, a triumphal arch, and other buildings, enclosed by a wall, in which 40 gates have been traced, 15 of them still in a good state of preservation. The population could not have been much less than 50,000. A synod was held there in A. D. 240, attended by 100 prelates. The site of this ancient city was discovered in 1844 by the French commandant Delamarre.

LAMBETH, a parish and suburb of London, 1½ m. S. W. from St. Paul's cathedral, on the S. side of the Thames, here crossed by the Waterloo, Westminster, and Vauxhall bridges; pop.

in 1851, 189,240. The borough of Lambeth returns 2 members to the house of commons. Lambeth palace, the town residence of the archbishop of Canterbury, is situated between Vauxhall and Westminster bridges, opposite the new houses of parliament. This property was acquired by the see in 1197, and has been improved by successive incumbents. The palace stands on a low site close to the river, surrounded by gardens 12 acres in extent. Its objects of interest are the Lollards' tower, founded some time prior to 1443; the banqueting hall; the chapel, with a fine roof of carved oak; and the library. Among its many literary treasures and curiosities is a superb Arabic Koran, presented by the governor-general of India through Claudius Buchanan in 1805, who calls it "the most valuable Koran of Asia." The library also contains the archiepiscopal registers of the see of Canterbury in regular succession from the year 1278, and the parliamentary surveys of ecclesiastical benefices in the time of the commonwealth, now used as legal evidence.

LAMBRUSCHINI, LUIGI, an Italian prelate, born in Genoa, May 16, 1776, died in Rome, May 12, 1854. He entered in youth the order of Barnabites, and became successively bishop of Sabina, archbishop of Genoa, papal nuncio to France, and in 1831 cardinal. Gregory XVI. appointed him secretary of state for foreign affairs, librarian of the Vatican, grand prior of the order of Malta, and minister of public instruction. On the death of Gregory in 1846, he received on the first ballot for the successor the largest number of votes. Under Pius IX. he became member of the state council, bishop of Porto, and chancellor of the pontifical orders. On the outbreak of the political commotions he fled to Civita Vecchia, subsequently returned to Rome, fled again in Nov. 1848 to Naples, and soon after joined the pope at Gaëta. He returned with him to Rome in 1850, and counselled, it is said, milder measures than those adopted by Cardinal Antonelli. He wrote some devotional works and a polemical dissertation on the immaculate conception.

LAMENNAIS, HUGUES FÉLICITÉ ROBERT DE, a French author, successively an ultramontane Catholic and a revolutionary philosopher, born in St. Malo, June 19, 1782, died in Paris, Feb. 27, 1854. A native of Brittany, the ardent faith and impetuous energy which has always distinguished the Bretons were leading elements in his character. Ohâteaubriand was born in the same street 14 years before. His father, a wealthy ship-owner engaged in commerce, had been ennobled by Louis XVI. He was early abandoned to himself in consequence of the death of his mother, and the ruin with which the forced loan and Spanish captures threatened the fortune of his father. He lived almost in solitude, sometimes obtaining assistance in his studies from his elder brother Jean, till about his 12th year, when he was intrusted to the care of his uncle, who confined him day after day in his library. He was soon able to read

Plutarch and Livy, to admire Rousseau, and to dispute with the parish priest about religion. It is remarkable that the study of heterodox and philosophical works seemed only to increase his predisposition to religious fervor. In his 16th year he retired with his brother to La Chênaie, a residence two leagues from Dinan, where he reduced his studies and various reading to order, mastered Latin, Greek, Hebrew, and several modern languages, and acquainted himself with the church fathers, doctors, historians, and controversialists. He was 22 years of age before he made his first communion, and he adopted the ecclesiastical profession only after long hesitation. He received the tonsure in 1811, but was not ordained priest till 1816, and was then influenced rather by the counsels of his friends and the exaltation of his character than by his tastes. "Lamennais," says Renan, "had no known master; no institution can claim any part of his renown. His profoundly marked character of race and his ecclesiastical education, Brittany and the seminary, it was these alone that formed him and can explain him." He had already made (1807) a translation of an ascetic work by Louis de Blois, marked by the same intimate blending of unction and force which distinguishes his later writings; had published (1808) his *Réflexions sur l'état de l'église*, his first protest against religious indifference, and the reigning philosophical materialism, which was immediately seized and destroyed by the imperial police; and was engaged with his brother on the *Tradition de l'église sur l'institution des évêques* (8 vols., Paris, 1814), in which he confuted the Gallican tenet that the election of bishops is valid without the sanction of the holy see. After having been teacher of mathematics in the seminary of St. Malo, founded by his brother, he went in 1814 to Paris, where he lived modestly and unknown, and saluted the return of the Bourbons by an anathema against Napoleon, declaring that "to study the genius of Bonaparte in the institutions which he formed, was to sound the black depths of crime, and to seek the measure of human perversity." Therefore judging it prudent to leave France during the Hundred Days, he took refuge in the isle of Guernsey, where he passed several months under the name of Patrick Robertson. He went thence to London, and was employed in the French school of the abbé Carron. Returning to Paris in 1816, he entered the seminary of St. Sulpice, which he quickly exchanged for that of the Fenillanines, where, excepting short absences, he remained several years, having the society of priests and of noble Catholic and royalist women. At 34 years of age he received sacerdotal ordination from the bishop of Rennes, and in 1817 he published the first volume of his *Essai sur l'indifférence en matière de religion*. This was the fruit of constant labor during many years of trial and obscurity, and had an immediate effect throughout Europe. "The humble priest," says Lacordaire, "found him-

self invested with the power of Bossuet." Resuming in a more eloquent and commanding tone the work of Catholic restoration begun by De Maistre, De Bonald, and Châteaubriand, he aimed to oppose to Protestantism and philosophy a demonstration of Christianity, to maintain the principle of ecclesiastical authority and the absolutism of faith. This work was received at first only with admiration and enthusiasm, and the author became a principal collaborator in the *Conservateur*, a journal founded by Châteaubriand, Villèle, De Bonald, Frayssinous, and others, which was chiefly directed against the ministry of Decazes. Though thus ranged among the defenders of the monarchy, he was more earnestly a Catholic than a royalist, and sought in the maintenance of the throne to secure guaranties for the stability of the church. The political hopes cherished concerning him were thus disappointed, and in 1820 he separated from his party with a portion of his colleagues, called the "incorruptibles," and vehemently assailed the ministry of Villèle in the *Drapeau blanc*, and afterward in the monthly *Mémorial Catholique*. It is affirmed that no writer displayed greater logical power and precision in the conflicts of that time. The first volume of his *Essai* was already suspected of innovating and dangerous consequences before the appearance of the second (1820), in which he rejected the Cartesian system, which gives authority to the individual reason, and developed a new theory of authority founded on the suffrages of mankind. He maintained that there is a sort of preestablished harmony between the doctrines of the church and the ideas of the race, that truth is attainable not only from revelation but from universal tradition, and thus sought to make the general consent of men the basis of an alliance between reason and faith. In the last two volumes (1824) he traced the transmission of truth through the ages, collected the scattered traditions of various peoples, and sought to demonstrate that Christianity alone possesses the double character of universality and perpetuity. The vast, though often incomplete and uncritical erudition shown in this work, its serious, brilliant, and imposing style, and its attempt to harmonize Catholicism with modern tendencies, make it the surest foundation of his reputation. It was unanimously and strongly opposed by the Sorbonne and the prelates, and was applauded only by a small body of ultramontane thinkers, who may be called his disciples. He wrote a short defence against the numerous attacks which were made upon it, and in 1824 went to Rome to present it to the pope. Though coldly received by the members of the sacred college, he found an admirer in Leo XII., who had his portrait in his oratory, called him the last father of the church, and offered him the dignity of cardinal, which he declined. On his return, after publishing a translation of the "Imitation of Christ," he produced his work entitled *De la religion, considérée dans ses rapports avec l'or-*

*dre civil et Catholique* (2 vols., Paris, 1825-'6), in which he attacked the declaration of 1682 which secured the liberties of the Gallican church, expounded a system of papal theocracy, and strove to establish the absolute spiritual supremacy of the holy see as the solution of the social problem. For this publication he was arraigned before the civil tribunal, and was condemned after an eloquent defence by Berryer. He himself at the close made a short address to the judges, terminating with the famous words: "I will let them see what a priest is." From this time, war was waged between Lamennais and the bishops of France. In the rigorous development of his principles he was obliged to found sovereignty in politics on the law of justice promulgated by the universal conscience of peoples, as he had founded it in philosophy on the universal tradition of the race. In his treatise *Des progrès de la révolution et de la guerre contre l'église* (1829) he first indicated his tendency toward political liberty while laying stress on theocratic absolutism. To combine democracy with the papal supremacy, liberal with Catholic ideas, became his avowed aim immediately after the revolution of 1830. He founded the journal *L'avenir*, having the significant motto: *Dieu et liberté—le pape et le peuple*, and was assisted by a corps of young and ardent disciples, among whom were Gerbet, De Salinis, Lacordaire, Rohrbacher, De Coux, and Montalembert. This remarkable publication went beyond the democratic party of the time in one set of its claims, and confronted the conservative party by another set. It pronounced the Gallican liberties to be a revolt against the church, and wished to subject all crowns to the tiara, as in the age of Gregory VII. It demanded administrative decentralization, extension of the electoral right, freedom of worship, universal and equal freedom of conscience, freedom of instruction, and the liberty of the press. Encouraged by a portion of the people and of the lower clergy, it was violently opposed by most of the prelates and Jesuits, who denounced it at Rome. While the contest was going on, the editors decided (Nov. 15, 1831) to suspend it for a time, and three of them, Lamennais, Lacordaire, and Montalembert, repaired to Rome to seek the papal approbation. No notice was taken of them on their arrival; Lamennais in vain sought a conference with the pope on the subject of his mission, and after waiting several months decided to return to France. He had gone as far as Munich, when he received the encyclical letter, dated Aug. 15, 1832, in which Gregory XVI. formally condemned the doctrines of *L'avenir*. His principal collaborators yielded at once to the decision; he himself announced that the journal would not again appear. A dogmatic submission was demanded from him, which he finally signed, reserving however to himself full liberty in regard to whatever he should believe for the interest of his country and of humanity. He

then retired to his patrimonial villa of La Chénaie, and composed, it is said within a week, his *Paroles d'un croyant*, which was not published till 1884, after a year of meditation. From its appearance dates his final and definite rupture with the Roman Catholic church. It is marked by all the concentrated passion, the tenderness, piety, simplicity, and energy of his character. It has been called the most terrible revolutionary chant of modern times, and in different passages it recalls the "Imitation of Christ" or the ferocious pamphlets of the reign of terror. It was immediately translated into the different European languages, passed through more than 100 editions in a few years, and received the papal condemnation as a book "small in size, but immense in its perversity." Having now become an ultra revolutionist both in church and state, he published in 1886 the *Affaires de Rome*, written in a tone of moderation unusual to him, in which he seems to cast a last melancholy look upon the belief which he had abandoned. In the following year he began a journal, *Le monde*, in the interest of extreme democracy, which survived but a few months. He subsequently produced various political pamphlets, one of which, *Le pays et le gouvernement* (1840), caused his imprisonment for a year in Sainte Pélagie, where he was daily visited by numerous friends. Others of them were *Le livre du peuple*, *L'esclavage moderne*, and *Du passé et de l'avenir du peuple*. His *Esquisse d'une philosophie* (4 vols., 1841-'6) contains a system in many respects akin to Neo-Platonism. The portion devoted to æsthetics is especially interesting, in which he explains how the plan of the Christian temple has given rise in succession to all the arts—architecture, sculpture, painting, music, and poetry. As one of the chiefs and the ablest writer of the republican party, he took part in the revolution of 1848, and, after editing the *Peuple constituant*, a daily newspaper, for 4 months, was elected by an unusually large vote one of the representatives of Paris in the constituent assembly. He projected a constitution in accordance with his own theories, which was rejected by the committee as too radical and impracticable; and though he deemed it useless to present it to the assembly, he would consent to no modification. For 4 years he protested by his silent vote against the course of events. After the *coup d'état* of Dec. 2, 1851, perceiving the temporary failure of his labors for the cause of liberty as before for that of religion, he sought only in study a solace for the sadness which had become habitual to him, and was occupied in his last years with translating Dante. At the news of his dangerous illness, priests, Jesuits, and even ladies of the highest rank exerted themselves to obtain admission to his chamber to induce him to be reconciled to the church; but by his express prohibition no one was received except those connected with his family. His obsequies were performed amid an immense concourse of people, and in accordance with his will his body

was borne directly to the cemetery without being taken to any church; and no cross, nor even stone, marks the grave of a man who perhaps more than any other moved the passions of his contemporaries. He was both one of the ablest defenders and one of the ablest opponents of the papacy in the present century. The constant element in his speculations was an ideal of democracy, which he sought to realize, in the first part of his career, by allying the people and the pope against the civil monarchy, and in the second part, by exalting the people to supremacy in defiance alike of the pope and the civil monarchy. The constant element in his character was an unbounded and lofty impetuosity, which demanded some absolute thesis either to support or assail. Circumstances made him successively the advocate of opposite parties, but the party which he uniformly detested was that of moderation. "He was," says Renan, "neither a politician, nor a philosopher, nor a savant; he was an admirable poet, obeying a severe and always irritated muse." He initiated and gave life to the ultramontane movement, which, after being the object of his most ardent devotion, prevailed in the church of France in spite of his efforts and with his maledictions. That he was a superior literary artist, and that his writings are admirable for elevation and force, is confessed even by those who esteem him a mediocre philosopher and a mad politician.—His complete works have been twice collected (12 vols., 1836-'37; and 11 vols., 1844 *et seq.*). His posthumous works are published under the care of Émile Forques (1856 *et seq.*).

LAMETTRIE, JULIEN OFFRAY DE, a French physician and philosopher, born in St. Malo, Dec. 25, 1709, died in Berlin, Nov. 11, 1751. He was the son of a rich merchant, received a liberal education, and was destined for sacred orders; but he preferred to devote himself to medicine. In 1738 he went to Leyden, where he placed himself under the direction of Boerhaave, several of whose works he translated into French. Returning to Paris, he was appointed physician to the *gardes Françaises*, followed that regiment to Germany, and witnessed the battles of Dettingen and Fontenoy. In 1745 he published his *Histoire naturelle de l'âme*, in which he denied the immateriality of the human soul, and placed man among the animals of the ape genus. In consequence of this he lost his office, and the following year, having issued his *Politique du médecin de Machiavel, ou le chemin de la fortune ouvert aux médecins*, a libellous attack upon his medical colleagues, he was obliged to fly to Holland. There he wrote and printed his noted atheistical work, *L'homme-machine* (12mo., Leyden, 1748), which was publicly burned by order of the authorities. Expelled from Holland, he was invited to Berlin by Frederic the Great, who made him his reader and a member of his academy. He lived on terms of familiarity with the king, and published several works of a similar tendency to his previous writings; among them were *L'homme-*

*plante* (Potsdam, 1748), *Réflexions sur l'origine des animaux* (Berlin, 1750), and *Vénus métaphysique, ou essai sur l'origine de l'âme humaine* (Berlin, 1752). He died of indigestion, caused by high living. Frederic wrote his eulogy.

LAMMAS DAY, in the calendar, the 1st day of August, so called perhaps from the custom which formerly prevailed among the tenants who held lands of the cathedral church in York, England, of bringing a live lamb into the church at high mass on that day. Some antiquaries derive the term from a Saxon word signifying loaf mass or bread mass, which was a feast of thanksgiving to God for the first fruits of the harvest; and Dr. Johnson thinks it is a corruption of "latter math," meaning a second mowing of the grass. Vallancey, in his *Collectanea de Rebus Hibernicis*, mentions that the 1st of August, Laithmas (pronounced La-ee-mas), was celebrated by the druids as the day of the oblation of grain.

LAMMERGEYER (Germ. *Lämmer*, lamba, and *Geier*, vulture), or BEARDED VULTURE (*Gypaëstus barbatus*, Cuv.), the largest of European birds of prey. It is about 4 feet long and 9 or 10 feet in extent of wings; the head and neck are completely clothed with feathers, and the cere is entirely hidden by projecting bristles; the bill is long and strong, straight, laterally compressed, with the tip curved and sharp; a tuft of stiff bristles projects forward like a beard from the base of the lower mandible; the wings are long, the 2d and 8d quills nearly equal and longest; tail lengthened and wedge-shaped; tarsi short and covered with feathers; toes moderate, the anterior ones united at the base by a membrane; claws curved, especially those of the inner and hind toes, and not well adapted for seizing and destroying prey. In the adult, the upper part of the head, the neck, and the under parts are whitish tinged with orange, deepest on the breast; the wings and tail are grayish black, the wing coverts dashed with orange white; the back deep brown; the beard and space including the eye and cere black; bill horn-colored. There is only one well characterized species, which inhabits the mountains of Europe, Asia, and northern Africa, especially the Alps and Pyrénées. Lammergeyers are seen usually in pairs; they feed on lambs, goats, chamois, &c., which they attack in such a manner as to cause them to leap over precipices, when they descend and devour the mangled carcases; they also eat carrion. The nest is made upon inaccessible rocks, rarely upon lofty trees, several feet in diameter and of coarse materials, and the number of eggs is 2 or 3. This bird plays the same part in the old world as the condor does in the new, and is very destructive to the flocks of the Alpine valleys; its strength and boldness are such that it might very well attack man, and stories are numerous, though not well authenticated, of its having carried off children. It is probable that the fabulous *roc* of oriental tales originated in some eastern variety of this large vulture. In its predatory habits and its

attacks on living animals, and its general refusal of carrion, it resembles the eagles; it is not abundant anywhere, and is rarely seen in Europe north of Germany. The African bird (*G. meridionalis*, Brehm.), and the Asiatic (*G. Himalayanus*, Hutt.), are probably only varieties of the bearded vulture.

LAMOILLE, a N. co. of Vt., drained by Lamoille river; area, 420 sq. m.; pop. in 1850, 10,872. The surface is hilly, the Green mountains traversing the county in a N. E. and S. W. direction. There is some excellent soil in the valleys, but the land is chiefly adapted to grazing. The productions in 1850 were 66,017 bushels of Indian corn, 278,252 of potatoes, 26,973 tons of hay, 437,110 lbs. of butter, and 427,918 of maple sugar. There were 5 grist mills, 8 saw mills, 4 woollen factories, 10 starch factories, 6 tanneries, 17 churches, and 4,344 pupils attending public schools. Capital, Hyde Park.

LAMORICIÈRE, CHRISTOPHE LÉON LOUIS JUHAULT DE, a French general, born in Nantes, Feb. 6, 1806. He is descended from an old legitimist family, and was educated at the college of Nantes, at the polytechnic school of Paris, and at the academy for military engineers of Metz, on leaving which he joined the Algerian army and entered the corps of Zouaves at the time of its formation (Nov. 1830). Placed in 1838 at the head of the office (*bureau Arabe*) organized by Gen. Avizard for the purpose of facilitating the relations with the native population, his intercourse with the Arabs became as useful to him as it was agreeable to them. Depending solely upon the influence of kindness and affability, he carried about his person in his exploration of the country no other means of defence than a light cane; hence the name of *Bou Aroua* or father of the cane conferred upon him by the Arabs. He took an active part in the capture of Constantine, the expedition against Mascara, the battle of Isly, and many other engagements. He commanded the Zouaves for several years until June, 1840, when he was succeeded by Cavaignac. The celebrity of the Zouaves was chiefly due to the skill which from the beginning Lamoricière had brought to bear upon their organization. In Nov. 1845, on the departure of Gen. Bugeand, he became provisional governor-general of Algeria, but went to France in 1846, in the hope of being able to exert a favorable influence upon the destiny of the African colony by taking a part in the parliamentary discussions on the subject. At first defeated as candidate for one of the arrondissements of Paris, he was elected to the chamber in Oct. 1846, as member for St. Calais, Sarthe. Returning to Algeria soon after, he crowned his military career by organizing the expedition against Abd el Kader which finished the war. He was reelected to the chamber of deputies in 1847, and when the revolution of Feb. 1848 broke out, he exerted himself in favor of the formation of a new administration under Louis Philippe, and as colonel of the national guard.

went among the people assembled on the Boulevards in order to allay the public excitement. But he was not listened to, and after the abdication of Louis Philippe he was slightly wounded while on his way to the Palais Royal to proclaim the regency of the duchess of Orleans. He soon recovered, however, and on the same evening tendered his allegiance to the provisional government. He took his seat in the constituent assembly as a member for Sarthe, and became prominent in the committee on military affairs. During the bloody days of June, 1848, he fought with so much spirit against the insurgents, that three horses were killed under him. He officiated as Gen. Cavaignac's minister of war until Dec. 1848, and was instrumental in introducing various measures for the benefit of Algeria. He strenuously opposed the election of Louis Napoleon to the presidency, and even questioned his right to citizenship. Being elected to the legislative assembly, he became president of the constitutional committee, and opposed the projects of the ultra radical party. In the course of the Hungarian struggle with Austria, he was intrusted with a diplomatic mission to Russia; but on his arrival there the Hungarians had already been crushed by the armed interference of the czar. On hearing of the overthrow of Odilon Barrot's administration (Oct. 31, 1849), he returned to France and resumed his seat in the legislative assembly. After the *coup d'état* of Dec. 2, 1851, he was arrested and detained in the fortress of Ham until Jan. 9, 1852, when he was permitted to go to Prussia. A letter of his, refusing to recognize the government of Louis Napoleon, was published in May, 1852. He afterward successively resided in Coblenz, Mentz, Wiesbaden and Ems. In April, 1860, having gone to Rome for the purpose, he was appointed by Pope Pius IX. commander-in-chief of the papal troops.

LAMOTTE, JEANNE DE LUZ, DE ST. REMY, DE VALOIS, countess de, a French adventuress notorious for her part in the intrigue known as the "affair of the diamond necklace," born at Fontête, Champagne, July 22, 1756, died in London, Aug. 23, 1791. She traced her origin to the baron de St. Remy, a natural son of Henry II., and in consequence of this received a small allowance from the court. After marrying a count de Lamotte, who was a spendthrift, she repaired to Paris, and succeeded in being introduced to Marie Antoinette, who took some interest in her, and to Cardinal de Rohan, grand almoner to the king. She persuaded Rohan that she could conciliate for him the affection of the queen, whom he professed to love devotedly, but who disliked him; and she even induced a Mlle. d'Oliva, who bore some resemblance to Marie Antoinette, to personate her majesty at a midnight interview with Rohan in the gardens of Versailles. The countess told him that the queen was desirous of getting a magnificent diamond necklace, then in the hands of the court jewellers and that the purchase of this ornament,

which was worth about \$850,000, would do much toward winning the queen's heart. The cardinal confiding in her representations, put himself entirely in her hands. She succeeded in getting possession of the necklace, which she pretended she had delivered to the queen, and for several months kept the robbery concealed by producing forged notes apparently written by the latter. But finally a direct application of the jewellers to her majesty awoke suspicion and brought on a judicial investigation, which resulted in a public trial before the parliament. The countess and her unsuspecting accomplice were incarcerated in the Bastille. All France became deeply interested in this intricate affair, in which the most infamous aspersions were thrown on the character of the queen. The verdict, rendered in 1785, left her entire innocence questionable in the eyes of many. The cardinal was discharged from all accusation, while the countess of Lamotte, who swore to the last that she was but a victim, was sentenced to be whipped, branded on the shoulder, and imprisoned for life. Her corporal punishment, owing to her desperate resistance, was one of the most dreadful scenes on record. After being incarcerated about two years at the Salpêtrière, she escaped, June 5, 1787, and fled to London, where she published libels against the queen. Her husband survived her, and twice wrote a complete history of the whole affair of the necklace; the first manuscript was taken from him by the French police; the second was mutilated in its most important parts. This mutilated manuscript was printed in 1858, under the supervision of L. Lacour, with the title: *Affaire du collier; Mémoires inédits du comte de Lamotte-Valois sur sa vie et son époque*. The best account of the affair and its political bearings is to be found in Louis Blanc's *Histoire de la révolution Française*.

LA MOTTE FOUQUÉ. See FOUQUÉ.

LAMP, a vessel employed for producing light, and sometimes also heat, by the combustion of inflammable fluids, grease, or wax. The simple form of these contrivances adopted by the ancient Hebrews has continued in use down to the present day; and until near the close of the last century this had hardly been improved upon among the most civilized nations. Even on the American continent may still be seen among the Canadian French the same low oval metallic vessel that was used by the ancient orientals and Europeans, furnished with a handle at one end and a beak at the other, through a hole on the upper surface of which projects the wick from the reservoir of oil or grease below. Some are made to be carried in the hand and place upon tables, and others are kept suspended by chains in the middle of rooms. They give a dim smoky light, in consequence of the carbonaceous matter not being sufficiently spread by an open wick to be reached by the oxygen of the air before it is dissipated in sooty vapor. (See COMBUSTION, and FLAME.) The external form of the lamp was

more of a study to the ancients than the principles of combustion. They gave to it the most graceful outlines, and ornamented it with grotesque figures and fanciful designs which were often of great beauty. They suspended their lamps from the ceiling or from the hands of ornamental figures of boys or men, or they were placed upon stands. As at the present day in Aleppo and Egypt, they were kept by the Hebrews burning all night; and to this much importance was attached, the putting out of the light being significant of the extinction of the family and desertion of the house. Hence the frequent use of such phrases in the Scriptures, especially in Job and the Proverbs, as "The lamp of the wicked shall be put out;" and of the prudent wife, "Her candle goeth not out by night."—The first improvement in the construction of lamps was removing the beak by a long neck to a distance from the reservoir of oil, thus reducing the width of the shadow cast by the lamp. Beside this object, it was soon found by those who investigated the matter, that the following were subjects for improvement: 1, the wick, which as used presented a bundle of fibres, the inner portion of which, though saturated with oil, was removed from the reach of the air required for its combustion; 2, the level of the surface of the oil, that from first to last it should bear the same relation to the level of the burning part of the wick, thus securing uniformity in the supply of oil for combustion; and 3, the concentration of the light by reflectors at points where it is wanted. The wick was first improved and much used in the countries bordering on the Rhine by plating its fibres together to make it flat and ribbon-like. A flat socket was provided for it, and it was made to move up and down by a horizontal spindle and toothed wheel, which could be turned by the fingers as required. This was known as the Worms lamp, and it has of late years been introduced into New England. A greater improvement was that of the Argand burner, in which the wick was made in the form of a hollow cylinder, and so arranged that a current of air could pass up within it, as well as come to its external surface. The addition of a chimney of sheet iron, as originally made by Argand, by producing an upward draught increased the supply of air. (See ARGAND LAMP.) The effect of the chimney was afterward much increased by contracting its upper portion and forming a shoulder, against which the ascending current impinges, and is turned inward upon the flame. The so called astral lamps were provided with these wicks, and the reservoir for the oil was arranged in the form of a hollow ring encircling the hollow central stand that supported the burner, and with which it was connected by one of the tubular braces that held it up. Thus the level of the oil in the shallow ring could not undergo much change, and it continued very nearly the same as that of the burning part of the wick until it was almost exhausted. In consequence of the thin and pe-

culiar shape given to the ring the lamp cast no shadow at a little distance off, and a vase of ground glass surrounding the flame served to render the light still more diffusive or scattered. One form of it was hence styled the *sinumbra* lamp (Lat. *sine umbra*, without shade). In this lamp was first introduced the contrivance for moving the wick up or down by causing the hollow metallic cylinder that carries it to travel round another in which is a spiral slot; a fixed pin projecting from the outer cylinder into this slot causes the cylinder to be lifted or depressed according to the direction of the revolution. Many other forms of lamp were also contrived with special reference to reducing the shadow. In some the reservoir was supported on one side of an upright rod, and partially counterbalanced by the burner, chimney, shade, &c., on the other side. The shadow of the lamp would thus fall only in one direction, and this might be against the wall. The reservoir was also placed considerably above the level of the burner, so that the shadow should be directed upward; or considerably below this level, so that it should fall upon the table; and ingenious mechanical devices were introduced, in the one case to regulate the downward flow of the oil, and in the other to raise it to the burner. The more perfect were these devices the more expensive were the lamps; and the simpler astral lamps for many years continued to be generally preferred as the most convenient and easily kept in order. In the year 1800 Carcel devised an ingenious piece of clock-work machinery for pumping the oil from a reservoir at the foot of the lamp up to the burner, and thus supplying this always from the same point, while the excess of oil flowed back into the reservoir. This being at the base of the stand and the flame at the top, there was consequently no shadow. The lamp, afterward slightly improved by other manufacturers, was in many respects the most perfect of these contrivances; but its great cost restricted its use to the wealthy. It was moreover so inconveniently large and heavy, that it could be moved only with difficulty; and the complicated nature of its mechanism required access to skilful workmen, such as can be found only in large cities, to keep it in repair. Vases or globes of ground glass, such as were first applied to the *sinumbra* lamp, were found necessary in all the large lamps with brilliant flames to reduce the dazzling effect of the light, by causing the rays to cross each other in every direction, as they pass through the glass, which appears to the eye as if it were itself their central source. And in order to economize the light, and direct the chief portion of it only where it is required, reflectors of metal were contrived, some approaching a parabolic form, with surface brightly polished, for turning the light back into the room in parallel rays, which would otherwise be wasted upon the wall; and others of conical shape, to be suspended over the flame, their inner surface whitened to prevent absorption of the light, and their sides inclined,

at least in those constructed with reference to the most useful effect, at an angle of  $60^{\circ}$ . The most perfect reflectors are those described in the article *FANZEL*. The attention directed in the early part of the present century to the subject of producing artificial light by convenient and efficient methods caused many more forms of lamps to be introduced than can here be named. Some were designed to burn the crude whale oil, which on account of its viscosity requires to be heated before it can pass along the fibres of the wick. Parker's hot oil or economic lamp was especially adapted for this use. The reservoir was a double cylinder of metal surrounding the upper portion of the chimney, which was also of metal, the lower part being of glass. It was supported by a side arm, which was made hollow to convey the oil to the burner below. A paper shade served to conceal the apparatus above the flame, and also to reflect the light downward. This lamp is very highly commended by Dr. Ure for its illuminating power and economy. The lamps of Benkler, constructed in Wiesbaden in 1840, introduced a peculiar contrivance in the form of the burner, which caused the draught of air to impinge at an angle upon the flame, making the combustion more vivid and the light more brilliant. It rendered practicable the use of poor qualities of oil, such as in other lamps were very imperfectly consumed, and only with the production of much smoke and disagreeable smell. The so called solar lamps, first made by Mr. Smith in Birmingham, depended on this principle; and it was essential to the excellent solar lamps made by Cornelius of Philadelphia, which, by means of a metallic cylinder passing from the burner down into the reservoir, permitted the use of lard instead of oil, sufficient heat being conveyed from the flame to keep it in a melted state. The solar lamps, on account of the cheap materials they consume, have been very extensively used; but they require particular care to keep them clean. The wick must be frequently changed, and always freshly trimmed with every using; and the reservoir also must be freshly filled at the same time. A report of comparative experiments made in 1844 for the U. S. treasury department with the solar lard lamp, an Argand burner for rosin gas, and an Argand oil lamp such as was used in the lighthouses, by Prof. Walter R. Johnson and others, is contained in "Senate Document No. 166," 28th congress, 2d session. The results are also given in the American edition of Knapp's "Chemical Technology" (1848), vol. i. p. 212. This work contains also much information respecting the various sorts of lamps and their comparative advantages. The results of the comparative trials referred to were, that from the same weights of the materials employed, the quantity of light afforded by lard was represented by the figures 1068; by rosin gas, of specific gravity 0.8098, "or 48 per cent. superior in density to coal gas," by 956; and by sperm oil ( $\frac{1}{2}$  summer and  $\frac{1}{4}$  winter strained) by 711. Lard being estimated to cost

5.8 cents per lb., oil 91.6 cents per gallon, and rosin 65.8 cents per barrel of 800 lbs., the relative cost was calculated as follows: lard 81.9, rosin gas 86.8, oil 100.—The forms of lamp so far noticed are not adapted for being carried about in the hand, and their advantageous qualities depend on their being employed for several persons together. Little progress has been made in the production of economical, safe, and convenient small lamps. The vapor lamps, made for burning the vapors arising from a mixture of oil of turpentine and alcohol, which is kept sufficiently heated by a metallic tube passing down into the mixture from the flame, promised to meet this want; but they proved expensive in use, and not altogether free from danger and the offensive smoke and smell of burning turpentine. Similar lamps are in use for burning the volatile hydrocarbons obtained from the products of the distillation of bituminous coals. To these succeeded a variety of so called camphene lamps, some account of which has been given in the article *BURNING FLUID*. For the economy and convenience attending their use they are very generally employed, although for years past some fatal accident has been almost daily chronicled resulting from the explosion of the dangerous fluid. The oils obtained by distillation of bituminous coals are introducing new forms of lamps adapted to their use, and it is believed that these present all the advantages of cheapness, portability, and brilliancy of light that distinguish the camphene lamps, while their entire safety gives to them a preference which must cause the use of the latter to be entirely abandoned. A multitude of burners have been contrived for these lamps, all made with reference to effecting the most thorough combustion of the oil. One of these in very general use has a flat wick  $\frac{1}{2}$  of an inch broad, which is moved up and down by a horizontal spindle. The wick tube is set in a hollow cap of thin brass, which screws tightly upon the top of the lamp, and on each side of the tube is an aperture which extends down through the hollow cap into the lamp, so that any vapor arising from the oil can pass up to the wick. There are also apertures for admitting air into the cap, allowing it to mix with the volatile vapors. Over the cap is fitted tightly a brass ring or cylindrical piece perforated all around with holes to let in air to the wick; and this ring carries a dome-shaped cover of thin brass in the top of which is a slit or elongated opening a little larger than the wick and directly over it, through which the flame passes up. The dome being of smaller diameter than the ring, there is room outside of it for the base of a glass chimney to stand, and this is moreover supported outside by the extension upward of the brass cylinder. Another row of holes perforated at the base of this extension lets in air, which passes under the foot of the glass, and circulates up the outside of the dome, meeting the flame at the top. The dome with its opening is somewhat like the peculiar arrangement

in the solar lamp. The chimney is enlarged immediately above the flame, and is then contracted to the same diameter as below.—Lamps in chemical operations answer the purpose of small furnaces. They are made in a great variety of forms, adapted to special uses and the kinds of fuel employed. Some are oil lamps designed for the use of the blowpipe, and are furnished with a broad flat wick convenient for this purpose. Others are designed to consume alcohol; and these are either plain vessels, commonly of glass, furnished with a metallic tube for holding the wick and a closely fitting bell-shaped cover of glass for protecting the alcohol from evaporation when the lamp is not in use; or they are more elaborately constructed of metal, provided with an Argand burner, and made to slide upon an upright rod. This rod also supports movable rings adapted for holding crucibles and other vessels over the flame of the lamp. The heat is concentrated by the use of a metallic chimney; and in some lamps it can be intensified by propelling a current of air of annular form and concentric with the Argand burner, so directed as to impinge across the flame. Alcohol is preferred to oil for the reason that its flame leaves no sooty deposit upon the surfaces it touches, the effect of which is to cause the radiation of a considerable portion of heat. Illuminating gas, where it is available, is advantageously substituted for both oil and alcohol; and numerous devices are employed for obtaining from this either the greatest intensity of heat by the introduction of a current of air into the jet, or a disseminated heat by its diffusion over large surfaces. (See end of article BLOWPIPE, and GAS, as fuel.)—SAFETY LAMPS. In the article COLLIERIES mention is made of explosions which occasionally occur in coal mines, and of the necessity of guarding against them by the use of safety lamps. Contrivances called steel mills were first used to give light in dangerous parts of the mines, a succession of sparks being constantly elicited by the rapid revolution of little wheels of steel against pieces of flint. In an explosive mixture of gas and air these however were not safe, as the sparks were liable to produce explosion. Their greatly increased brilliancy in this served to indicate danger; and where the gas predominated above the explosive proportion the sparks were of blood-red color or ceased entirely to be emitted. The necessity of more efficient protection led to the invention in 1818, by Dr. W. R. Clanny of Sunderland, Durham, of the first true safety lamp. In this the communication with the external air was intercepted by water, through which the air was made to pass. This apparatus proved too cumbersome for general use. In 1815 Mr. George Stephenson and Sir Humphry Davy both invented safety lamps on other principles. The former, noticing the effect of the gaseous products of combustion to extinguish the burning jets of inflammable gas called blowers, which issue from the crevices of coal mines, contrived a lamp which was protected

by a glass cylinder, and covered at top with a perforated metallic cap to allow the products of combustion to pass out. The air to support combustion was admitted through small openings in the bottom, and it was supposed that the velocity of the current entering the lamp would prevent the explosion passing backward; but the protection the lamp afforded was really owing to the smallness of the apertures, continued through capillary tubes till they discharged all around and close against the circular burner. Davy's lamp, commonly known as the Davy, has already been noticed in the article on that distinguished chemist. The wire gauze cylinder, through which the air was admitted, served also for the passage of the light, and when composed of wire of  $\frac{1}{16}$  to  $\frac{1}{8}$  of an inch in diameter, and with 28 wires or 784 apertures to the inch, proved a perfect obstruction to the flame in the most explosive mixtures, unless these were blown in currents through the gauze, or the lamp was carried rapidly through the gas. The wires might even be heated red hot, as sometimes happens in very foul air by the flame leaving the wick and burning in the upper part of the cylinder, and no explosion take place; but if a glass cover became hot it might be broken by drops of water falling upon it; and so fragile a material under any circumstances could not be regarded as a sure protection. Among the various modifications of the Davy are lamps provided with a cylinder of glass which is protected with an outer one of wire gauze, thus combining the advantages of both. The Clanny lamp has a lower cylinder of stout glass, upon the top of which is a smaller one of wire gauze. The glass in this case is for the sake of its allowing a greater quantity of light to pass than the wire gauze. Others have been made with two glass cylinders, one within the other, with a space between them for the passage of air from the top down, passing through wire gauze at the top and again at the bottom as it entered the lamp. The outer cylinder, being protected from the heat by its separation from the flame and by the cold air passing through, is not liable to be broken by the dropping of water upon it; and if by any accident it should be broken, the inner one, if it escaped injury, would still serve for a temporary protection. The most perfect of the safety lamps are provided with the Argand burner and a glass shade within the wire gauze. The common Davy has the ordinary cotton wick in the round tube, and a wire passing through the bottom of the lamp is so bent within and without, that it can be used to snuff the wick and to push it up or down.

LAMPASAS, a central co. of Texas, formed in 1856, bounded W. by the Colorado river and drained by the Lampasas; area, 910 sq. m.; pop. in 1858, 1,196, of whom 136 were slaves. The surface is much broken and the soil is fertile. Cotton, oats, rye, millet, and the Chinese sugar cane are found to thrive, and much of the land is well adapted to grazing.

LAMPBLACK, a sooty substance deposited

in the combustion of vegetable matters. It forms when the flame is chilled by the introduction within it of a cold body, the effect of which is to check the conversion of the fine particles of carbon into carbonic acid, and cause them to gather in visible masses upon the cold surface; it is also collected upon the walls of flues and chambers arranged for the passage of the volatile products of combustion that arise from fires fed with insufficient air. It consists of finely divided carbon, more or less mixed with the various compounds into which the elements of vegetable substances resolve themselves when submitted to the process of destructive distillation. It is consequently of very variable composition, and possesses different qualities according to the different conditions, as to distance from the fire, amount of air admitted, &c., as well as according to the kind of combustible matters employed. Wood deposits on the walls near the fire a glistening varnish-like substance of blackish brown color, which contains dried tar with a little charcoal. This is called glance-black, and is the portion of the carbonaceous deposit which is used for the preparation of bistre, and for the preservation of meats. The soot collected further from the fire contains much more carbon, and is known as flake-black. The resins, fats, and oils give a product rich in carbon with little tarry matter. That collected far from the fire is a dark pitch-black substance, much used as a pigment in the preparation of dark colors. It is the coloring matter of printers' ink, and is an essential ingredient in shoe blacking and numerous similar preparations. The finest quality of it used formerly to be collected by the combustion of refuse oils in lamps, whence the name lampblack. It may be obtained in its greatest purity by passing oil or alcohol through tubes in a state of ignition. An impalpable powder is deposited, having neither taste nor smell, a conductor of electricity, and more than twice as heavy as water.—Various sorts of apparatus are in use for collecting lampblack. By the German process refuse resinous substances, as pine leaves, branches, chips, &c., are burned in ovens with the least possible quantity of air, and the smoke is conveyed in a low horizontal flue about 15 feet long to a chamber of the capacity of from 2,000 to 3,000 cubic feet. This has a pyramidal or conical shaped roof of some woollen stuff of loose texture or of sheet iron, which can be lowered down into the chamber, scraping its walls as it descends. The smoke passing slowly through the flue and the chamber leaves in the former the cruder product, and in the chamber upon its walls and in the hood the finer quality. This is frequently shaken down, especially from the woollen covering, the pores of which otherwise become filled, obstructing the draught. The freshly deposited lampblack is liable to ignite spontaneously on exposure to the air. By the English method the smoke is passed through a series of bags, arranged vertically side by side, in which the lampblack is already assorted as

to quality in collecting. The impure sorts, which are injured by the empyreumatic resins they contain, are purified by igniting them in close vessels with access of very little air. The whole becomes red hot, and the tarry and ammoniacal matters with a small portion of the lampblack are consumed. Coal tar and bituminous coal are used for the production of inferior qualities of lampblack.

LAMPREY, a cyclostome or marsipobranch fish of the family *petromyzonini* (*hyperoartia*, Müller), and genus *petromyzon* (Linn.). This order, with the myxinoidea, constitutes the class of myxozoa of Agassiz. The blood is red, the heart distinct, the branchial artery without a bulb and furnished at the base with 2 valves; the body smooth, cylindrical, and vermiform, mouth anterior, gills fixed, and eyes distinct; the single olfactory cavity opens above by an external foramen, leading to a blind canal not communicating with the mouth through a perforated palate as in the myxinoidea; thorax cartilaginous, sustaining the branchial apparatus composed of rib-like strips descending on each side beneath the skin, with 7 external spiracles, opening from the fauces into a sub-oesophageal tube, having a posterior caecal extremity. These are the first fishes in which there is a distinct brain enclosed in a cartilaginous cranium; there are 2 dorsal fins, the posterior joined with the caudal, and mere folds of skin with scarcely perceptible rudimentary rays; pectorals and ventrals absent; the cephalic cartilage is undivided; there is a spout hole in the head, and a spiral valve in the intestine; there is no oviduct nor seminal duct. The jaws are absent, but the circular mouth, tongue, and pharynx are armed with conical or crescentic sharp teeth of indurated alumen. The gills are 7 little fixed bags, each having its proper artery, its opening into the sub-oesophageal tube, and its external foramen by which the water passes out.—The old genus *petromyzon* has been subdivided into 6, according to the shape and arrangement of the teeth. The common European lamprey, or lamprey eel as it is often called (*P. marinus*, Linn.), attains a length of more than 8 feet; the color is yellowish marbled with brown. Having no air bladder and being destitute of lateral fins, they are usually found near the bottom, and to avoid being carried away by the currents they attach themselves to stones by means of the tongue, which acts like a sucking piston in the circular mouth, whence the names of *petromyzon* and cyclostomes; in the same manner they attach themselves to larger fishes, which they devour; by means of the apparatus above described respiration may be carried on independently of the mouth, the branchial currents passing from one series of openings to the other across the sub-oesophageal tube. The intestine is small and nearly straight; the eggs are laid late in the spring, the milt and roe escaping by a membranous sheath communicating with the abdominal cavity. They ascend rivers from the sea to spawn. They are very gen-

erally distributed in Europe from the Mediterranean to the arctic waters, ascending the rivers in spring; at this season great numbers are caught, their flesh being considered a delicacy. The food of the lamprey consists of any soft animal matter, especially the flesh of fishes to which they attach themselves. The river lamprey or lampern (*P. fluviatilis*, Linn.) is a smaller fish, and confined to fresh or brackish water; the length is from 12 to 18 inches, and the color bluish olive above and silvery below. Great numbers were formerly caught in the Thames, Severn, &c., and sold to the Dutch for bait in the turbot fishery. This and the preceding species are very tenacious of life, living several days out of water. The fringed-lipped lamprey (*P. Planeri*, Bloch) is about 10 inches long, stout, with the circular lip margined with small cirri, and the 2 dorsals nearly united; it is found in the rivers of Europe. The *P. mordax*, of Australia, has the dorsals widely separated.—The most common of the American species is the *P. Americanus* (Lesueur), growing about 2½ feet long; the color is olive brown above, with blackish brown confluent patches, and beneath uniform dull brown. This is not uncommon in the rivers of New England and New York, especially near their mouths; it likes best shallow rapid streams with pebbly bottoms, in which it builds circular nests 3 or 4 feet in diameter and a foot or two high, bringing stones in the mouth varying from the size of a hen's egg to that of the fist. They ascend high falls by clinging to the rocks, after suddenly darting forward; though uncommon in rivers obstructed by dams, they are abundant at their outlets, especially in the Merrimack near Lowell. Several other species are described in Dr. Storer's "Synopsis of the Fishes of North America."—The genus *ammocetes* (Duméril) should be here mentioned. It has the same cylindrical body, branchial apertures, and fins as the lampreys; the mouth is semi-circular, without teeth, the posterior lip transverse, and ciliated within; the branchial apertures open internally into the oesophagus itself; the incomplete circle of the mouth prevents its adhering to rocks and other bodies; the external branchial openings are placed in a longitudinal furrow. It is often called mud lamprey, from its being found in the mud and sand. The best known species in Europe is *A. branchialis* (Ouv.), 6 or 7 inches long, about as thick as a goose quill, generally of a yellowish brown color above, darker on the head and back, lighter beneath; the eyes are very small; it spawns at the end of April, and feeds upon worms, insects, and dead matter, living in fresh water in many countries of Europe. Another species is the *A. borealis* (Ag.). Dr. Storer describes 3 species as occurring in North America, the *A. bicolor* (Lesueur), *A. concolor* (Kirtland), and *A. unicolor* (De Kay). From its resemblance to the lamprey, *ammocetes* was called *petromyzon* by the early writers. Aug. Müller (Müller's *Archiv*, 1856) maintains that *ammocetes* is the larval form of *petromyzon*, and does not attain the

perfect state until the 4th year from the egg; subsequent observations confirm this view, which, if true, is a remarkable instance of partial metamorphosis in fish, and shows upon what transitory characters genera may be founded. According to Van der Hoeven, the cleavage of the yolk is entire, and in the first stage of development there is much analogy with that of the frog.

LAMPSCAUS, or LAMPSACUM, a Greek city of Mysia in Asia Minor, situated on the Hellespont near where it expands into the Propontis. Its original name had been Pityusa, but being colonized at an early period by Ionians from Phocæa and Miletus, they called it Lampsacus. It had an excellent harbor, and became a place of extensive commerce. Miltiades, the son of Cypselus, who had established himself in the Thracian Chersonesus, made war on the Lampscænes, but was surprised and taken prisoner by them. Cræsus however espousing his cause, they restored him to freedom. After the rise of the Persian power, Lampsacus became subject to it. On the overthrow of the Persians at Mycale Lampsacus joined the Athenian confederacy, but it afterward revolted when intelligence arrived of the destruction of the Athenian armament and army in Sicily. It was however reduced by Strombichides, and remained dependent on Athens till the time of Alexander, when it was absorbed in the Macedonian, and subsequently in the Roman dominions. In the age of Strabo it was still a place of importance. Charon the historian, Anaximenes the rhetorician, and Metrodorus the philosopher, were natives of Lampsacus, which was also a chief seat of the worship of Priapus. Its territory was famous for wine. The name of Lampsacus is still preserved in that of Lamsaki, a small village near the probable site of the ancient city, of which no trace now remains.

LANARK, the county town of Lanarkshire, Scotland, situated on the river Clyde, 656 feet above the sea, 25 m. S. E. from Glasgow, and 81 S. W. from Edinburgh; pop. in 1851, 5,005. Its inhabitants are employed chiefly in hand loom weaving for the Glasgow and Paisley manufacturers. Shoes are also made. There are several breweries and flour mills.—About 1 m. S. is the manufacturing village of New LANARK, on the Clyde; pop. in 1851, 1,642. This village owes its origin to David Dale, who erected a cotton factory there toward the end of the 18th century. He was succeeded in the management by his son-in-law, Robert Owen, who in 1815 attempted an economical experiment among the work people. They numbered about 2,500, and were under his control until 1827, when he retired from the management of the works. A French writer who visited New Lanark thus described it in Owen's day: "The houses of the colony are of a simple but elegant structure; some contain a number of chambers, or small apartments, for one or two workmen or for a family; others in their upper stories have magazines of provisions of every description;

and in the lower parts are shops open at certain hours of the day, where each workman or family may obtain credit till it reaches the amount of the sum due for a month's labor; and in case of the birth of a child, illness, &c., additional advances are made. Beside 2 vast buildings for the workmen, and the large detached house which serves for a magazine, there are 3 others: first a manufactory 6 stories high; then a fine edifice with a spacious court before it for the children, with halls of instruction, exercise, and prayer. A little further on, close to a canal that communicates with the Clyde, there is a common kitchen and refectory for the unmarried workmen. The infirmary, under the care of a physician and a surgeon, has but 38 patients, out of 2,800 persons, including 850 children, of whom the colony consists." After stating other employments of the community, the writer adds: "The employment of time is measured at 7 hours for sleep,  $\frac{1}{2}$  hour for prayers,  $\frac{1}{2}$  hour for the toilet, 10 hours for classes or for labor, and 6 hours for meals and recreation. There is no special mode of religious instruction; and individuals of all persuasions, as Methodists, Anabaptists, Independents, Quakers, and others, may be found, and the Sundays are appropriated to tranquillity and repose." The establishment did not prove successful, and no trace of its peculiar features now remains.

**LANARKSHIRE**, or **CLYDESDALE**, an inland county of Scotland, bounded N. by the counties of Dumbarton and Stirling, E. by Linlithgow, Edinburgh, and Peebles, S. by Dumfries, and W. by Ayr and Renfrew; area, 986 sq. m.; pop. in 1851, 580,169. The river Clyde traverses the whole length of the county, and with its tributaries is noted for beautiful river scenery. The falls of Bonnington, Cora Linn, and Stonebyres are much visited by lovers of the picturesque. The county is nominally divided into 3 wards, the upper, middle, and lower; the upper is mountainous, the middle hilly, and the lower level. The Lowther hills, along the S., are from 2,000 to 3,000 feet high, but afford extensive ranges of pasturage. In these hills are valuable lead mines, consisting of 4 principal veins 4 to 10 feet thick, one of which has been wrought to a depth of 140 fathoms. Coal is also found in seams from 2 to 9 feet in thickness, and ironstone both in seams and masses. Dairy husbandry is carried on with great success. Oats are the principal grain crop, but wheat and barley are extensively grown. Clydesdale is noted for its orchards, as well as for its breed of draught horses. It is the seat of vast manufacturing industry in collieries, iron works, and cotton, flax, silk, and woollen factories. Lanarkshire returns one county member to parliament, with 4 others from its boroughs. In the time of James III. of Scotland gold was found in Lanarkshire, from which coins were struck called unicorns. Capital, Lanark.

**LANCASHIRE**, or the **COUNTY PALATINE OF LANCASTER**, a maritime, manufacturing, and mining county of England, on the Irish sea;

area, 1,905 sq. m.; pop. in 1851, 2,081,386. Liverpool is the great maritime emporium, and the only port of any magnitude. The principal manufacturing towns are Manchester, Bolton, Preston, Blackburn, Oldham, Ashton, Stockport, Bury, Chorley, Wigan, Rochdale, &c. The surface is nearly level, except in the N. and E. The long ridge known as the "backbone of England" separates the county from Yorkshire on the E., and the N. district is broken by Conistone Fells (2,577 feet high) and other considerable eminences. The Duddon, Lune, Wyre, Ribble, Mersey, and Irwell are the principal rivers. The prevailing geological formations are limestone, and carboniferous and new red sandstone. The Lancashire coal field covers 400 square miles of the S. and S. W. of the county thus underlying the whole of the manufacturing districts, and extending into Cheshire and North Wales on the one side, while on the other it is separated by but a brief interval from the coal fields of Yorkshire. Copper, iron, and lead are also found. Peat mosses form a remarkable feature of the surface. The principal of these swamps was formerly Chatmoos, 7 miles long, once considered irreclaimable, but now mostly under cultivation. The climate is humid, but temperate, and the soil moderately fertile. Dairy and hay farms are numerous, and potatoes are more extensively grown than in any other English county. The most important manufactures are cottons, woollens, worsted, flax, and silk goods, hats, paper, and soap. The manufacturing districts are traversed by a large number of canals and railways. Lancashire was made a county palatine by Edward III. in 1359. Riots took place in many parts of Lancashire in 1826 for the destruction of power looms. At present it is the most influential manufacturing district of England, and takes a leading position in all public questions, particularly those connected with commerce and industry. Lancashire returns to parliament 4 county and 22 borough members. The duchy of Lancaster is permanently annexed to the crown, and its net revenue is paid into the sovereign's privy purse. The receipts in 1855 were £86,000, and the expenditures £18,000. The "chancellor of the duchy of Lancaster" is a cabinet officer. Capital, Lancaster.

**LANCASTER**. I. A. S. E. co. of Penn., bounded S. W. by the Susquehanna river and S. E. by Octorara creek; area, 928 sq. m.; pop. in 1850, 98,944. The surface is uneven, South mountain extending along the N. W. frontier, and Mine ridge passing through the S. E. part. The surface between these mountains is undulating and traversed by many small streams. Blue limestone, roofing slate, marble, chrome, and magnesia are found in the county. The soil is a rich calcareous loam. The productions in 1850 were 1,808,312 bushels of Indian corn, 1,865,111 of wheat, 1,578,321 of oats, 215,277 of potatoes, 29,048 lbs. of wool, 1,907,843 of butter, and 96,134 tons of hay. There were 191 grist mills, 68 saw mills, 54 lime kilns, 4

iron mines, 11 furnaces, 5 iron founderies, 28 brick yards, 58 tanneries, 87 distilleries, 2 cotton factories, 17 woollen factories, 10 newspaper offices, 195 churches, and 17,000 pupils attending public schools. Capital, Lancaster. II. An E. co. of Va., on Chesapeake bay and on the N. side of the mouth of Rappahannock river; area, 161 sq. m.; pop. in 1850, 4,708, of whom 2,640 were slaves. The surface is nearly level and the soil is fertile. The productions in 1850 were 120,580 bushels of Indian corn, 24,424 of wheat, 10,857 of sweet potatoes, and 8,343 lbs. of wool. There were 7 grist mills, 1 saw mill, 10 churches, and 282 pupils attending public schools. Value of real estate in 1856, \$953,626, showing an increase of 20 per cent. since 1850. Capital, Lancaster Court House. III. A N. district of S. C., bordering on N. C., and bounded E. by Lynche's creek and W. by Catawba river; area, 690 sq. m.; pop. in 1850, 10,988, of whom 5,014 were slaves; white pop. in 1859, 6,478. The surface is diversified. The productions in 1850 were 352,218 bushels of Indian corn, 21,644 of wheat, 65,100 of oats, 84,683 of sweet potatoes, and 8,661 bales of cotton. There were 7 grist mills, 7 saw mills, 25 churches, and 569 pupils attending schools. Capital, Lancasterville.

LANCASTER, a city and the capital of Lancaster co., Penn., situated on the Pennsylvania central railroad, 68 miles by railroad and 55 in a straight line W. from Philadelphia; pop. in 1860, 16,000. The Conestoga river runs for more than half a mile within the city limits, and approaches the city line within a few hundred feet at the termini of one of the principal streets. From this point to where it enters the Susquehanna, at Safe Harbor, is by the course of the stream 19 miles, which in 1826 was made navigable for small craft by means of dams and locks. By this route, as well as by the railroad to Columbia, 12 miles distant, great quantities of coal and lumber are brought to Lancaster, the trade in these articles forming a considerable portion of the business of the place. The principal part of the town is elevated nearly 100 feet above the Conestoga, from which the city is supplied with water, which is raised by machinery to two large reservoirs. The cost of the works to the present time has been \$190,000. They were begun in 1835. The streets are generally straight and well paved, and cross one another at right angles. Gas has been introduced. Most of the city is substantially built of brick, many of the houses, particularly those erected within the past few years, being elegant and commodious. Among the public buildings, one of the most imposing is the court house, which is 160 feet long, 70 feet wide, 2 stories high, and surmounted by a dome. It contains all the county offices and 2 court rooms, and cost \$170,000. The county prison contains 80 cells, and is kept on the solitary labor system. It is a large castellated building of old red sandstone, erected at a cost of \$116,000. Its tower, 102 feet high, is the first object which strikes the eye of a traveller approaching Lancaster.

The old gaol, famous as the scene of the murder of the Conestoga Indians in 1763 by the Paxton boys, was taken down in 1851, and Fulton hall, a large and elegant building, used for concerts and as a theatre, now occupies its site. There are 20 churches (2 African, 1 Church of God, 2 Episcopal, 2 German Reformed, 3 Lutheran, 2 Methodist, 1 Moravian, 1 New Mennonite, 1 Presbyterian, 2 Roman Catholic, 1 Swedenborgian, and 2 United Brethren). The public schools usually contain 2,000 pupils. The male high school accommodates 130 scholars, and the course requires 4 years. The female high school contains 120 pupils. The amount of tax raised for school purposes in 1859 was \$15,981.55. Franklin and Marshall college stands on a rising ground in the N. W. corner of the city. The number of students in the college and preparatory department is 120. The buildings are yet incomplete. One daily and 6 weekly newspapers are published in the city. One of the principal manufactures of Lancaster is that of rifles, for which the place has long been celebrated; and the government is supplied by it with large numbers of these weapons. There are 3 large cotton factories, erected in 1846-'8, employing over 1,000 operatives. The Lancaster locomotive works have been suspended since the commercial crisis of 1857. Several iron founderies and a furnace are in operation here.—Lancaster was founded about 1718, and for some years was called Hickory Town. On the organization of the county in 1729, and the removal of the seat of justice from Conestoga in 1730, it took its present name. In 1742 it was chartered as a borough, and in 1818 made a city. In 1777 congress sat here for a few days, and the house still stands in which Paine wrote his letter to Lord Howe. From 1799 to 1812 it was the capital of the state, and from 1750 to 1825 was the largest inland town in the country.

LANCASTER, a village of Hocking township and the capital of Fairfield co., Ohio, situated on Hocking river, and on the line of the Cincinnati, Wilmington, and Zanesville railroad, 80 m. S. E. from Columbus, and 125 m. N. E. from Cincinnati; pop. in 1859, 6,000. It has an active trade, and is connected with the Ohio river by the Hocking canal. It is well built, the streets being wide and handsome, and many of the public and other edifices attractive. In 1859 it had 9 churches, 8 newspapers, a branch of the state bank of Ohio, an insurance office, 4 hotels, and several manufacturing establishments.

LANCASTER, a parliamentary and municipal borough, parish, and seaport of England, capital of Lancashire, situated on both sides of the Lune, on the canal from Preston to Kendal, and on the Preston, Lancaster, and Carlisle railway and a branch of the great north-western; pop. in 1851, 16,168. It is built chiefly on the side of a hill, the summit of which is crowned by a church and castle. The older streets are narrow, but many of the houses are handsome, and there are several striking public buildings. The

river is here crossed by a bridge of 5 arches and a magnificent aqueduct for the canal. The town hall, county lunatic asylum, theatre, baths, assembly rooms, custom house, churches, and castle are the most interesting edifices. The last is remarkable for its size and elegance, and embraces the courts, gaol, penitentiary, &c. The principal manufactures are upholstery, furniture, cotton, silk, linen, sail cloth, and cordage. There are several ship building yards, but this branch of industry is less attended to than formerly. The foreign trade of Lancaster is likewise declining, though it still retains a large commerce with Russia and America, and employs numerous coasting vessels. During the year 1856 the commerce of the port was as follows: vessels entered, 1,982, tonnage 189,355; vessels cleared, 1,753, tonnage 189,253; of these, 1,905 vessels of 183,186 tons entered coastwise, and 1,785 vessels of 184,733 tons cleared coastwise; registered shipping, vessels 101, tonnage 10,969. Lancaster returns 2 members to parliament.

LANCASTER, SIR JAMES, an English navigator, born about 1550, died in 1620. After serving in the East and West against the Portuguese, Spaniards, &c., he was appointed to command the first expedition sent out by the English East India company. He sailed from Torbay, Feb. 15, 1601, with 5 vessels, and returned to England in 1603, having not only fulfilled the duties imposed on him by his principals, but established commercial relations between them and the princes of Bantam in Java and Acheen in Sumatra. He entered warmly into the projects for discovering a N. W. passage to India, and strongly urged the government to attempt it. Baffin named after Capt. Lancaster a sound opening into Baffin's bay. Lancaster was knighted by Queen Elizabeth. An account of his voyages and discoveries will be found in Hakluyt and Purchas.

LANCASTER, JOSEPH, an English educational reformer, born in London in 1771, died in New York, Oct. 24, 1838. The system of which he became a principal advocate and promoter had been originally introduced into England from India by Dr. Bell. It involved a course of mutual instruction, and from his boyhood Lancaster seems to have been deeply impressed with its advantages. In 1789 he accordingly opened a school for poor children in Southwark, whom he taught almost gratuitously, and whose number gradually increased to 800. His success attracted public attention to the new system, subscriptions poured in to him from all quarters in support of it, and numerous schools on the same plan were opened by him in different parts of the country. A rival now appeared in the person of Dr. Bell, who, having the patronage of the clergy of the established church, soon cast Lancaster, who was a Quaker, into the shade, and broke up his establishments. The latter, after failing at home, emigrated in 1818 to the United States, where he was well received, but injured his prospects by imprudence.

In 1829 he went to Canada, where the legislature made him some pecuniary grants to enable him to give his system a fair trial. Becoming again embarrassed, some of his friends purchased for him a small annuity, and he removed to New York. He wrote a work on "Improvement in Education" (London, 1805), several elementary school books, and pamphlets in defence of his system, which is now generally known by his name and successfully practised in many parts of Great Britain and other countries.

LANCASTER SOUND, a channel leading from Baffin's bay W. to Barrow strait, in the American arctic regions. Its E. entrance lies between Capes Horsburgh on the N. and Liverpool on the S., in lat.  $73^{\circ} 45'$  to  $74^{\circ} 55' N.$ , long.  $79^{\circ} W.$  On the W. it opens into Prince Regent inlet, Barrow strait, and Wellington channel. It is the entrance to the N. W. passage, and was probably in the course of Sir John Franklin's last voyage. Length about 250 m.; central breadth about 65 m. The great island of North Devon forms its northern coast, and several islands formerly thought to be part of Cockburn island its southern. On the former side Croker bay opens into it; on the latter it receives Navy Board and Admiralty inlets. It was discovered by Baffin in 1616.

LANCE, a weapon. See ARMS.

LANCE, GEORGE, an English painter of still life, born in Little Easton, near Colchester, March 24, 1802. He studied with Haydon, and first exhibited at the academy in 1828, since which time he has been a pretty regular contributor to the annual exhibitions of the academy and the British institution. His favorite subjects are fruit, flowers, game, &c., arranged in picturesque and effective confusion, and which he executes with an elaborateness and a richness of color almost equalling the efforts of the old Dutch masters of still life. Sometimes he introduces figures, as in his "Red Cap," in which a monkey is represented presiding over a table covered with fruits and festal appointments. He has also painted historical and imaginative pieces. He restored a large portion of the celebrated "Boar Hunt" of Velasquez in the British national gallery.

LANCE, WILLIAM, an American author and politician, born in Charleston, S. C., in 1791, died in Texas in 1840. He was educated at the associated academy of Charleston, in which he held the first rank for scholarship. He passed thence to the law offices successively of Thomas Parker and Judge Richardson, and soon attained distinction as a scholar and public speaker. His services were often in request as an orator on public occasions. He was sent to the legislature in 1812 as a member of what was then known as the republican party in contradistinction to the federal. He wrote frequently, chiefly as a political essayist. Though without collegiate advantages, he was a diligent classical student, composed in Latin with ease, and wrote in that language a biography of Washington, published in Charleston, which received the approbation of

competent scholars. A similar work by Francis Glass appeared soon after in New York (1835); but, though both were commended by critics as creditable specimens of Latinity, they were not applied to the use designed by their authors of instruction at once in the Latin language and American history.

LANCE WOOD, a wood imported from the West India islands and South America in long poles from 3 to 6 inches in diameter. The tree is the *Guatteria virgata*, formerly known as the *varia lanceolata*. It resembles boxwood, but is of somewhat paler yellow. It is remarkably stiff and elastic, and is consequently well adapted for the shafts of carriages, bows, and springs. It is largely employed for these, as well as for surveyors' rods, billiard cues, and rules, which ordinarily pass for boxwood.

LANCELOT, DOM CLAUDE, a French grammarian, born in Paris about 1615, died in Quimperlé, April 15, 1695. In early life he attracted the attention of the celebrated abbé St. Cyran, and through his influence he joined the recluses of Port Royal, whom he greatly assisted in the organization and management of the schools connected with their community. He wrote grammars of the Latin, Greek, Italian, and Spanish, and a *Grammaire générale et raisonnée*, still highly valued. On the dispersion of the society of Port Royal by order of the king, Lancelot became preceptor of the duke of Chevreuse's son, and afterward, from 1669 to 1672, was attached in the same capacity to the two young princes of Conti. In 1678 he retired to the abbey of St. Cyran, where he led a life of austerity; and in 1680 was ordered to Quimperlé, where his last years were spent in devotion. His *Grammaire générale*, better known as *Grammaire de Port Royal*, has been frequently reprinted.

LANCISI, GIOVANNI MARIA, an Italian physician, born in Rome, Oct. 26, 1654, died there, Jan. 21, 1720. He was bred for the church, but having abandoned the study of theology for that of the natural sciences, he was graduated doctor in medicine and philosophy at the college of the Sapienza in Rome at the age of 18. In 1676 he was appointed assistant physician to one of the hospitals, and some time later was nominated to the chair of anatomy at the Sapienza, which he filled with great reputation for 13 years. Pope Innocent XI. in 1684 presented him with a canonry. He filled various professional offices, was physician successively to the college of cardinals and to the pope, and enjoyed many titular honors and the friendship of Clement XI. He left a number of valuable works, chiefly relating to his favorite studies of anatomy, natural philosophy, and mathematics. Among them are: *De Subitaneis Mortibus* (4to., Rome, 1707), written in consequence of many sudden deaths which occurred at Rome in 1705-'6; *De Nativis atque Adventitiis Romani Colli Qualitatibus, cui accedit Historia Epidemice Rheumaticæ quæ per Hyemem Anni 1709 vagata est* (1711); *De Noxiis Paludum Effluviis eorum-*

*que Remediis* (1717); *De Motu Cordis et Anæurismatibus* (1728). A collection of his works appeared in his lifetime (2 vols. 4to., Geneva, 1718), and a complete edition in folio was published at Venice in 1739.

LANDAU, a fortified town of Germany, in Rhenish Bavaria, on the Queich, 18 m. N. W. from Carlsruhe, on the railway from Paris to Mentz; pop. about 7,000. It contains an arsenal, and various manufactories. It was formerly an imperial city; was ceded to France in 1680, and after the fall of Napoleon in 1814 was restored to the Germanic confederation.

LANDEN, JOHN, an English mathematician, born in Penkirk, near Peterborough, in Jan. 1719, died Jan. 15, 1790. Little is known of his personal history, except that from 1762 to 1788 he held the position of agent for Earl Fitzwilliam. He was retired in his habits, but disposed to be quarrelsome and dogmatic in society. His earliest mathematical writings appeared in the "Ladies' Diary" for 1744, and most of his subsequent papers were contributed to the "Transactions" of the royal society of London, of which he was admitted a member in 1766. He is best known by his "Residual Analysis" (London, 1764), in which he proposed a new form of fluxionary calculus, and invented a set of symbols. His plan has been thought an improvement on the method of ultimate ratios, but it lacks simplicity, and was never in general use. The principal other works of Landen are: "Mathematical Lucubrations" (4to., London, 1755); "Animadversions on Dr. Stewart's Computation of the Sun's Distance" (4to., 1771); "Observations on Converging Series" (4to., 1781); "Mathematical Memoirs respecting a Variety of Subjects" (2 vols. 4to., 1780-'89).

LANDER, LOUISA, an American sculptress, born in Salem, Mass., about 1835. In early youth she manifested her taste for sculpture by modelling heads for dolls, and carving bas-reliefs on alabaster and other soft substances. As she grew older she modelled excellent likenesses of various members of her family, and executed cameo heads. At about the age of 20 she went to Rome and became the pupil of Crawford, and soon after finished in marble "Today," a youthful figure emblematic of America, and "Galatea." Among her subsequent works are a bust of Gov. Gore of Massachusetts, in Gore hall, Harvard college, executed from 2 oil portraits; a bust of Hawthorne; a spirited statuette of Virginia Dare, the first English child born in America; a life-size statue of Virginia; a reclining statue of Evangeline; "Elizabeth, the Exile of Siberia;" a statuette of Undine, and one of "Ceres Mourning for Proserpine;" and numerous portrait busts. She is now (1860) engaged upon a figure of a "Sylph Alighting."

LANDER, RICHARD, an English traveller, the discoverer of the course of the river Niger in Africa, born in Truro, Cornwall, in 1804, died on the island of Fernando Po, Feb. 7, 1834. He was of humble extraction, and early found employment in a menial capacity. In 1825, im-

pelled by a spirit of adventure, he entered the service of Capt. Clapperton, whom he accompanied upon his second African expedition. After the death of Clapperton at Sackatoo, he returned to England, and in the latter part of 1829 published "Records of Capt. Clapperton's Last Expedition to Africa" (2 vols. 8vo., London), prepared from Clapperton's papers and his own journal. In Jan. 1830, accompanied by his brother John, he sailed for Africa under government auspices to continue the explorations of Clapperton; and departing from Badagry near Cape Coast Castle, March 22, he reached Boossa on the Quorra, or Niger, June 17. Thence the brothers ascended the river 100 miles to Gaoorie, and returning to Boossa early in August, commenced the descent of the stream in canoes, Sept. 20. After numerous hazardous adventures, they reached the mouth of the river through its principal arm, the Nun, in the latter part of November, and were received on board an English brig, in which they sailed to Fernando Po. In June, 1831, they arrived in England, *via* Rio Janeiro; and in the succeeding year a narrative of the expedition, prepared by Lieut. Becher from the account of the Landers, was published in 2 vols. with a map. In addition to the discovery of the course of the Niger, they first ascertained its confluence with the Benoowe or Tchadda, as it was called. In 1832 an expedition, consisting of a brig and two small steamers, was organized by a company of Liverpool merchants for the purpose of opening a trade with the tribes along the Niger, and placed under the command of Richard Lander. It reached the river Nun Oct. 16 in the same year, and proceeded to ascend the Niger to Boossa. The natives, however, showed little disposition to trade with the Europeans, and Lander returned ill to the sea coast in the succeeding spring, with the loss of several of his men by sickness. In the latter part of July he reascended the river in one of the steamers (the other having returned to Europe), as far as Rabba, about 100 miles below Boossa; but the natives proved so indifferent to trade that the expedition, regarded as a commercial venture, was a failure. On this voyage he ascended the Benoowe as far as the country of Domah, 104 miles; but finding the people inhospitable and uncommunicative, he was forced to return through failure of provisions to the Niger. On Nov. 27 the expedition was again in motion up the river under the command of Dr. Oldfield, Richard Lander designing to follow early in 1834 with supplies. On Jan. 20 the latter, while proceeding up the Brass river, an arm of the Niger, was severely wounded in a conflict with the natives of the Eboe country. He escaped down the river in a canoe, and succeeded in reaching Fernando Po, where he died soon after. In 1835 an account of his last voyage was published under the title of "Narrative of the Expedition into the Interior of Africa by the River Niger, in the Steam Vessels Quorra and Alburkah, in 1832, 1833, and 1834, by McGregor Laird and

R. A. K. Oldfield, surviving officers of the expedition."

LANDES, *Les*, a maritime department of France, forming part of the ancient province of Gascony, and bounded N. by Gironde, E. by Lot-et-Garonne and Gers, S. by Basses-Pyrénées, and W. by the bay of Bisçay; area, 3,599 sq. m.; pop. in 1856, 309,832. The name is derived from the sandy and marshy plains which compose the greater part of its surface. These plains prevail generally in the interior, and are in many places covered with thorny shrubs over which the shepherds stalk on stilts. The only crops which the *landes* yield are maize and barley. The coast district is studded with numerous lagoons; but toward the S., where the roots of the Pyrénées interrupt the continuity of the plain, and the tributaries of the Adour irrigate the soil, the country is fertile, and abounds in corn, wine, and various kinds of fruit. The other productions of this department are timber, coal, iron, and marble. The climate is mild, but unhealthy. The principal manufactures are glass, porcelain, earthenware, paper, leather, &c., employing about 6,000 persons. The chief rivers are the Leyre, Adour, and Gave-de-Pau. Capital, Mont de Marsan.

LONDON (MACLEAN), LETITIA ELIZABETH, an English authoress, born in Old Brompton, a suburb of London, in 1802, died at Cape Coast Castle, Africa, Oct. 15, 1888. Much of her youth was passed at a country seat in Hertfordshire, among scenes and associations which could hardly fail to develop a poetic and imaginative nature. At 18 she began to write poetry, and a few years later, while residing with her grandfather at Old Brompton, she made the acquaintance of William Jerdan, who published some of her small pieces in the "Literary Gazette," of which he was then the editor. They were signed "L. E. L.," as were most of her subsequent productions, and attracted considerable attention. Others of a higher strain succeeded, and "L. E. L." soon became one of the most popular metrical writers of the day. Mr. Jerdan next employed her as a general contributor to the "Gazette," not of original poems merely, but of reviews and miscellaneous articles; and in time her labors became so numerous and important as to entitle her to be called rather a co-editor than an occasional contributor, her efforts being, as Mr. Jerdan has stated, scarcely less than his own. Her intimacy with Mr. Jerdan gave rise to many cruel slanders, which caused her the keenest sufferings. Her father dying in somewhat destitute circumstances when she was yet a child, she became the chief support of her family, and for a period of 15 years was a ready and prolific writer in prose and verse for the annuals and for a variety of periodicals. In 1821 she published a small collection entitled "The Fate of Adelaide, and other Poems," which was succeeded by "The Improvisatrice," "The Troubadour," and other long pieces. The rich fancy and the romantic and melancholy sentiment

which pervaded them seemed to accord very happily with the popular taste. The sadness which characterized Miss Landon's poetry, however, and which elicited many expressions of sympathy in her behalf, was purely imaginative, as she was of a cheerful and even joyous disposition, and possessed many attractions of person and manners. The Ettrick Shepherd, who had severely criticized her poems, could not repress his admiration upon meeting her for the first time, but exclaimed with characteristic bluntness: "I did nae think ye had been sae bonny." Miss Landon also published 4 novels, "Ethel Churchill," "Francesca Carrara," "Romance and Reality," and "Duty and Inclination," which however were not so successful as her poems. Another novel commenced by her, entitled "Lady Anne Granard," was published 2 years after her death. In June, 1838, she was married to George Maclean, who held an official station at Cape Coast Castle in West Africa, and soon afterward sailed with him for her new home. She died in a few months after her arrival there from an overdose of prussic acid, which she had been accustomed to take in small quantities for hysteric affections, and was discovered lying dead upon the floor of her chamber. A coroner's jury found no cause for suspicion that her death had been produced intentionally. In 1841 Laman Blanchard published the "Life and Literary Remains of L. E. L.," in 2 vols. 8vo.

LANDOR, WALTER SAVAGE, an English author, born at Ipsley Court, Warwickshire, Jan. 30, 1775. His father, Walter Landor, a gentleman of good birth and property, took for his second wife Elizabeth Savage, a Warwickshire heiress, who added to her husband's fortune a dowry of more than £80,000. Walter Savage Landor was their eldest son, and was educated with great care under private tutors, at Rugby school, and at Trinity college, Oxford. Being rusticated at the university for firing a gun in the quadrangle, he never returned to take his degree. He was at first designed for the army, and then for the legal profession, but his independent and impulsive nature made him ultimately prefer a life of freedom and literary pursuits on an income granted him by his father. Soon after leaving Oxford, in 1795, he published a volume of poems. In 1798 appeared a more important poem, "Gebir," which he had written in Swansea, and which was favorably noticed by Southey in the "Critical Review." This approval was amply satisfactory to Landor, who cared nothing for the opinions of smaller critics, and induced him to republish it in a Latin version (1803). In 1802 he visited Paris, and saw Napoleon made consul for life. On the death of his father he succeeded to the family domains, and purchased other estates in Monmouthshire; he expended £7,000 in improving them, and built a mansion which cost £3,000; but in 1806, in disgust with some of his tenantry, one of whom had absconded several thousand pounds in his debt, he sold off his entire property, a part of which had been in his family for 700 years, and

ordered the mansion which he had built to be demolished. He determined to live abroad free from the trammels and vexations of an English landlord. In 1808, at the outbreak of the insurrection in Spain against Napoleon, Landor was said to be the first Englishman who went to assist the Spanish patriots. He raised a body of troops at his own expense, conducted them from Corunna to Aguilar, the head-quarters of Gen. Blake, viceroy of Galicia, presented 20,000 reals to the cause, received the thanks of the supreme junta for his services, and was appointed a colonel in the Spanish army. He resigned his commission on the restoration of King Ferdinand and the subversion of the constitution framed by the Spaniards during their struggle for independence, declaring "that though he was willing to aid the Spanish people in the assertion of their liberties against the antagonist of Europe, he would have nothing to do with a perjurer and a traitor." In 1811 he married Julia Thuillier de Malaperte, of Bath, a daughter of the baron de Nieuville, descendant and representative of the nobleman of that name who had been first gentleman of the bedchamber to Charles VIII. In 1815 he removed to Italy, where he has since resided, with the exception of occasional tours and a residence of several years in Bath, England. He occupied for 7 years the palace of the Medici at Florence, and then purchased the villa and gardens of Count Gherardesca, at Fiesole, near that city. In 1820 he published at Pisa his Latin *Idyllia Heroica*, with an appendix in Latin prose on the reasons why modern Latin poets are so little read. His literary reputation was greatly increased by his prose work entitled "Imaginary Conversations" (5 vols. 8vo., London, 1824-'9). These supposed dialogues between remarkable personages of past or present times admirably illustrate the peculiarities of the different interlocutors and of the periods in which they lived, and also abound in paradoxical and original opinions. They were followed by a new edition of "Gebir, Count Julian, and Other Poems" (1831); by "Pericles and Aspasia" (1836); a "Satire on Satirists and Admonition to Detractors" (1836); the "Pentameron and Pentalogia" (1837); and the dramas "Andrea of Hungary and Giovanna of Naples" (1839). All these works were written in Italy. During his residence at Bath, he published the "Hellenics" (1847); a new edition of the *Gebirus, Idyllia Heroica*, &c., under the title of *Poemata et Inscriptiones* (1847); "Imaginary Conversation of King Carlo Alberto and the Duchess Belgiososo on the Affairs and Prospects of Italy" (1848); "Popery, British and Foreign" (1851); the "Last Fruit off an Old Tree" (1853); "Letters of an American" (1854), under the pseudonym of Pottinger; "Antony and Octavius" (1856); "Dry Sticks Fagoted" (1857); and frequent contributions to the "Examiner" newspaper. The last named book contained some most objectionable poems, libelling a lady of Bath to whom Landor had conceived an intense

personal dislike, and for which he was prosecuted and subjected to a verdict of £1,000 damages. Occasional pungent letters and epigrams on foreign politics still appear from his pen in the English journals. Southey, in a note to his "Vision of Judgment," writes: "Of the author of 'Gebir' and 'Count Julian' I can only say in this place, that to have obtained his approbation as a poet, and preserved his friendship as a man, will be remembered among the honors of my life when the petty enmities of this generation will be forgotten, and its ephemeral reputations shall have passed away." Emerson, in his "English Traits," says of him: "He is strangely undervalued in England—usually ignored—and sometimes savagely attacked in the reviews. The criticism may be right or wrong, and is quickly forgotten; but year after year the scholar must go back to Landor for a multitude of elegant sentences—for wisdom, wit, and indignation which are unforgettable." All of his writings contain highly intellectual and vigorous passages, but his poems especially display an effort to reproduce the genius and style of Hellenic poetry, and seem foreign to modern habits of thought. An edition of his collected works was published in London in 1846 (2 vols. 8vo.; reprinted in 1853). A selection from his writings was edited by George S. Hillard (Boston, 1856).—His brother, the Rev. R. E. LANDOR, is the author of several works, including two remarkable novels, the "Fawn of Sertorius" (2 vols., 1846), and the "Fountain of Arethusa" (2 vols., 1848).

**LAND'S END** (anc. *Bolerium Promontorium*), a remarkable headland projecting into the Atlantic at the W. extremity of Cornwall, England. It is formed of granite cliffs, whose summits are 60 feet above the level of the sea, and is the most western point of Great Britain. About one mile distant from it are the dangerous rocks called the Longships, on which has been erected a lighthouse with fixed lights 88 feet above high water. On a peninsula near by is one of those natural curiosities called "log-ging" or "logan stones," so poised on a fulcrum that they can be made to rock.

**LANDSEER.** I. JOHN, an English engraver and author, born in Lincoln in 1769, died Feb. 29, 1852. His reputation was founded on the engravings furnished for Bowyer's edition of Hume's "History of England" and Moore's "Views in Scotland" toward the close of the last century, and on a series from the works of Rubens, Snyders, and other artists. In 1806 he delivered a course of lectures on engraving at the royal institution. At the same time he was elected an associate engraver in the royal academy, an honor which he accepted for the purpose of removing the restrictions against the admission of engravers to full membership. Failing in this object, he devoted himself chiefly to literary pursuits, and started at different periods two art journals, both of which speedily failed. He also cultivated archæology, and published a 4to. volume on engraved gems and

hieroglyphics. His "Descriptive, Explanatory, and Critical Catalogue of some of the Earliest Pictures in the National Academy" is full of amusing gossip. His best engraving is the "Dogs of Mount St. Bernard," from one of the earliest pictures of his son, Sir Edwin Landseer. II. THOMAS, eldest son of the preceding, born about the close of the last century. He adopted his father's profession, and has executed many engravings in mezzotint from his brother Edwin's pictures. He is also known as an excellent etcher. One of his latest works is an engraving of Rosa Bonheur's celebrated picture of the "Horse Fair." III. CHARLES, brother of the preceding, a painter of *genre*, born in the early part of the present century. He received his first instructions in painting from Haydon, who manifested great interest in his progress. He first exhibited in the royal academy in 1828, and in a few years gained the reputation of a clever painter of domestic history and *genre*. He succeeded on several occasions in receiving from the art union the highest prizes for his works on exhibition. Among his most popular pictures are "Pamela," "Clarissa Harlowe in Prison," "The Monks of Melrose," &c. He is a member of the royal academy, and in 1851 was appointed keeper. IV. SIR EDWIN, brother of the preceding, a painter of animals, born in London in 1808. While a child he was remarkable for skill in drawing, and for the facility with which he seized the characteristic expression of the object he was imitating. His father encouraged his talent, and personally superintended his education. He took him into the fields, and made him copy the ordinary domestic animals, at rest or in motion, from the life, and in the same way caused him to acquire his first notions of color. By these means Landseer soon became a ready and skilful painter from nature, and at the age of 14 attracted attention by his spirited sketches of terrier dogs, horses, cats, and other animals. Two years later he exhibited his "Dogs Fighting," which was purchased by Sir George Beaumont, and shortly afterward a striking picture of two St. Bernard dogs rescuing a traveller from the snow, which was engraved by his father. About this time he received to a limited extent instructions and advice from Haydon, but never, like his brother, became a regular pupil. He also drew in the schools of the royal academy, and from the Elgin marbles; but animals, and particularly those of the domestic kind, were the chief objects of his study. The praises bestowed upon his youthful performances served as an incentive to fresh exertions, and each year witnessed an improvement in the finish and details of his works. In 1827 he was elected an associate member of the royal academy, having just reached the requisite age, and about the same time made a visit to the highlands of Scotland, the impressions derived from which have been reproduced in a series of characteristic works. Among his best pictures are: "The Return from Deer-Stalking," exhibited in 1827; the "Poach-

ers—Deer-Stalking;" "None but the Brave deserve the Fair;" "Sir Walter Scott and his Dogs;" "The Otter Speared;" "The Stag at Bay;" "The Drive—Shooting Deer on the Pass;" "The Random Shot," a touching picture, representing a fawn endeavoring to draw suck from its dead dam; and "Night and Morning," a stag fight, and the "Children of the Mist," two of his latest and most remarkable works. Of a different class, but quite as effective of their kind, are the "Illicit Whiskey Still;" "Highland Music," now in the Vernon collection; the "Drover's Departure;" "The Old Shepherd's Chief Mourner," a sheep dog watching by his master's coffin; "High Life" and "Low Life;" the "Distinguished Member of the Humane Society," a noble portrait of a Newfoundland dog; "The Shepherd's Prayer," and many others, extending over a period of 80 or 40 years. No English painter of the century has been more universally popular, and none, unless perhaps Sir Thomas Lawrence, has received more lucrative rewards from his pencil. His pictures have for many years been regularly engraved, and for the copyright of some of them he has received as much as £3,000 in addition to the price of the picture. For more than 80 years Landseer has been a royal academician, and in 1850 he was knighted. At the *exposition universelle* of 1855 in Paris, a large gold medal was awarded to him, an honor accorded to no other British artist.

LANE, EDWARD WILLIAM, an English orientalist and author, born about the commencement of the present century. The greater part of his life has been devoted to the study of the oriental languages, particularly Arabic, in which he is deeply learned; and for many years he has been employed in preparing an Arabic lexicon and thesaurus, which is not yet completed. As an author he is widely known by his translation of the "Arabian Nights," published in 8 magnificent volumes, with illustrations by W. Harvey (1840), and by his "Manners and Customs of the Modern Egyptians" (8d ed. with additions, 2 vols. 8vo., London, 1842), one of the most valuable works of the kind ever published, and the materials for which were procured during a lengthened residence in Grand Cairo, where he still remains. He has also published "Arabian Tales and Anecdotes," and "Eastern Tales and Anecdotes."

LANE, JOSEPH, U. S. senator from Oregon, born in North Carolina, Dec. 14, 1801. In 1804 his father removed to Henderson co., Ky. The educational advantages of the son were meagre. From early boyhood until he attained the age of 20 he was alternately employed in the office of the county clerk, and in a dry goods store. In 1821 he married and settled on a farm in Vanderburg co., Ind. The following year he was elected to the legislature. From that time he represented his adopted county in one branch or the other almost continuously for 25 years. When the war broke out with Mexico in 1846, he resigned his seat in the state senate and vol-

unteered as a private soldier. His company with several others having assembled at New Albany, and formed a regiment, Mr. Lane was elected colonel. A few days afterward he received from President Polk a commission as brigadier-general. He immediately set out for the seat of war, in command of 3 regiments of Indiana volunteers, and in two weeks landed at the Brazos, and reported for duty. His brigade was assigned to Gen. Butler's division. At the battle of Buena Vista he commanded the left wing, and commenced the engagement by attacking a division of the Mexican army numbering 5,000, commanded by Gen. Ampudia. In the course of the day he was wounded in the right arm, but remained on the field. In June, 1847, he went to New Orleans, where the Indiana regiments were disbanded. Returning to Gen. Taylor's line, he was ordered to join Gen. Scott. Landing at Vera Cruz Sept. 16, he set out for the city of Mexico in command of 3,000 men. On Oct. 9 he defeated Santa Anna at Huamantla. On the 19th he attacked a strong force of guerrillas at Atlixco, and took the place, losing but one man, while the loss of the enemy in killed and wounded was 500. On the 29th he broke up another guerilla band at Tlascala. On Nov. 22 he took Matamoras, which was strongly fortified, capturing a large amount of ammunition and military stores; and on Dec. 14 he reached Gen. Scott's head-quarters. On Jan. 15, 1848, he left the capital under orders to scour the country between Mexico and Vera Cruz, to rid it of guerilla marauders. After an unsuccessful attempt to capture Santa Anna, who was at Tehuacan with 500 men, he took Orizaba, and was engaged in other successful partisan operations. On Feb. 17 he was sent out by Gen. Scott in pursuit of the robber chief Jarauta. On the 21st he reached Tulancingo, where Gen. Paredes barely escaped capture. On the 24th he came up to Jarauta at Tehuautaplan, and a fierce fight ensued, in which Jarauta was wounded but succeeded in making his escape. This was the last fighting during the war. Gen. Lane for his gallant services in Mexico was breveted a major-general. In Aug. 1848, he was appointed governor of Oregon territory, and reached Oregon City in March, 1849. He continued to discharge the duties of governor until Aug. 1850, when he was removed by President Taylor. In 1851 he was elected territorial delegate to congress. He was successively re-elected as a delegate until Oregon was admitted into the Union as a state in 1859, when he was chosen U. S. senator. In politics he is a democrat, having acted with that party since 1824. He was nominated for the vice-presidency by a democratic convention at Baltimore, in June, 1860.

LANFRANC, archbishop of Canterbury, born in Pavia about 1005, died in England, May 28, 1089. He was instructed in grammar and logic at Pavia, and in civil law in the university of Bologna, and after practising for several years as an advocate in Pavia, established himself at Avranches in Normandy, where he taught juris-

prudence with great reputation. Journeying from this city to Rouen about 1042, he was attacked by robbers, who stripped him and left him for dead. The monks of the neighboring Benedictine abbey of Beo having received him with great kindness, he soon after assumed the habit of the order, and in 1045 was chosen prior of the abbey. Here he opened a school, which became one of the most famous of Europe, embracing in its course all the learning of the age, and to which pupils resorted from England, France, Germany, Flanders, and even Italy. Among the learned men whom his reputation attracted thither was Berengarius, archdeacon of Angers, between whom and Lanfranco a famous controversy was conducted on the subject of the eucharist. At Rome in 1050, and subsequently at the council of Vercelli, Lanfranco combated the arguments of his opponent, who was repeatedly obliged to abjure his opinions. Having in 1059 procured for William duke of Normandy, who had married his cousin, the daughter of the count of Flanders, a dispensation from the pope, he became a favorite with William, and was appointed a councillor of state, and in 1066 abbot of the newly erected monastery in Caen, where he established a new school, which likewise became celebrated. After the conquest of England William summoned him to that country, and caused him to be elected to fill the see of Canterbury, then vacant by the deposition of Stigand. Lanfranco would have declined the honor, as he had previously the office of archbishop of Rouen; but at the command of Alexander II., who had been one of his pupils, he was consecrated in 1070. Having with some difficulty procured his recognition as primate of England, he gave a proof of his attachment to William by placing in vacant bishoprics and over the chief religious houses ecclesiastics of known fidelity to the Norman interest, which was thereby greatly strengthened in all parts of the kingdom. So highly was he esteemed for these and other services, that the chief direction of affairs both in church and state was committed to his hands whenever the king was absent in Normandy, and William Rufus upon his accession intrusted the government to him. In his ecclesiastical capacity he improved the discipline of the monastic bodies, strictly enforced the celibacy of the priesthood, established schools, convents, and hospitals, and built churches and cathedrals. His wisdom, learning, and munificence, according to the testimony of contemporary chroniclers, were alike conspicuous. His works, consisting of commentaries on St. Paul's epistles, letters, sermons, and his treatise on the eucharist against Berengarius, evince a clear, terse, and nervous style. A complete edition appeared in Paris in 1648. The latest is that by Giles (2 vols. 8vo., London, 1844).

LANFRANCO, GIOVANNI, an Italian painter, born in Parma in 1581, died in Rome in 1647. While a boy in the service of Count Orazio Scotti in Piacenza, he attracted the attention

of his master by some designs executed upon a wall with charcoal. He was placed under Agostino Carracci, and subsequently studied at Rome with Annibale Carracci, whom he assisted in decorating the Farnese palace. His chief work is the cupola of S. Andrea della Valle in Rome, in which he has represented the Virgin seated in the clouds surrounded by saints, and contemplating Christ, who is above. This work had been promised to Domenichino, his former fellow pupil, but Lanfranco intrigued successfully to procure the commission to execute it, as well as that of the Tesoro in Naples, which had also been given to Domenichino.

LANG, LOUIS, an American artist, born in Waldsee, Württemberg, March 29, 1814. His father, who was a historical painter, destined him for the musical profession; but his own tastes were for painting, and he finally determined to devote himself entirely to that art, and during the illness of his father aided in the support of his family by painting carriages, designing monuments, and decorating churches. He continued at the same time to perform in the choir of the cathedral. At 16 years of age he executed likenesses in pastel with considerable success, and during a residence of 4 years on the lake of Constance he painted nearly 1,000 portraits in pastel and oil. He went in 1834 to Paris, and subsequently established himself in Stuttgart. About 1838 he came to America and settled temporarily in Philadelphia. In 1841 he went to Italy, and spent 5 years studying in Venice, Bologna, Florence, and Rome. In 1845 he returned to America, taking up his residence in New York, and for two years employed himself in the decoration of interiors and in modelling plaster figures for ornamental purposes. In 1847 he again visited Rome, and remained there two years, returning to New York in 1849, where he has since resided. His pictures embrace a wide range of subjects.

LANGBAINE, GERARD, an English scholar, born in Westmoreland about 1608, died in 1658. The greater part of his life was passed at Oxford, where he was provost of Queen's college, and keeper of the university archives. He was an industrious writer, and succeeded in avoiding the political troubles of the time. His chief work was an edition of Longinus, in addition to which he published a number of minor treatises on church questions and miscellaneous topics.—GERARD, son of the preceding, born in Oxford in 1656, died in the early part of the 18th century. He was educated at University college, Oxford, and, after a career of idleness and extravagance, devoted himself to literary pursuits. He gave particular attention to the history of dramatic literature, and collected, it is said, upward of 1,000 old plays. His principal works are: "A New Catalogue of English Plays," and "Account of the English Dramatic Poets," both of which, though of little critical authority, are valuable to the student of dramatic history from the accuracy with which facts are related and editions described. Of

these works Lowndes says: "Of the several early catalogues of the English stage Langbaine's only is to be implicitly relied on for its fidelity. Commentators and others have borrowed copiously from him, many of them without acknowledgment."

**LANGBEIN, AUGUST FRIEDRICH ERNST**, a German author, born near Dresden, Sept. 6, 1757, died in Berlin, Jan. 2, 1835. He studied law, filled various public offices, and from 1810 till his death was censor of belles-lettres publications for the Prussian government. His complete works were published in 31 vols. (Stuttgart, 1835-'7), and comprise humorous poems, tales, and novels, some of which have been very popular.

**LANGDON, JOHN**, an American statesman, born in Portsmouth, N. H., in 1739, died there, Sept. 18, 1819. At the outbreak of the revolutionary war, although then profitably engaged in business, he embarked in the patriotic cause, and in 1774 participated in the removal of the armament and military stores from Fort William and Mary in Portsmouth harbor, an act which imperilled his life and property. In 1775 he was a delegate to the continental congress, but resigned office in June, 1776, on becoming navy agent. In 1777, while speaker of the New Hampshire assembly, he pledged a large portion of his property for the purpose of equipping the brigade with which Stark defeated the Hessians at Bennington. Subsequently he was a member and speaker of the state legislature, a member of the continental congress, a delegate to the convention which framed the constitution of the United States, and president of New Hampshire. He was one of the first U. S. senators from New Hampshire, which office he held until 1801. In politics he was a republican, and acted with Jefferson, who upon assuming office in 1801 offered him the post of secretary of the navy, which he declined. From 1805 to 1812, with the exception of 2 years, he was governor of New Hampshire; and in 1812 he was offered by the republican congressional caucus the nomination for the office of vice-president of the United States, which, on the score of age and infirmities, he declined. The remainder of his life was passed in retirement.

**LANGELAND**, an island of Denmark, situated between Laaland and Fünen, in the Great Belt; length 32 m., average breadth 4 m.; area, 106 sq. m.; pop. in 1851, 17,368. The E. coast has excellent harbors where the largest vessels may at all times find anchorage. The climate is healthful, and the soil fertile. Langeland forms with Fünen a circle of the kingdom. Capital, Rudkiöbing.

**LANGERON, ANDREAULT**, count, a Russian general of French birth, born in Paris, Jan. 18, 1768, died in St. Petersburg, July 4, 1831. He entered the French army as 2d lieutenant, and sailed in 1782 for the United States, where he served till the peace. He was promoted on his return to France, and held the rank of colonel

when the revolution broke out. He then left France, was admitted into the Russian service, and distinguished himself under Potemkin in Bessarabia, and under Repnin in Moldavia. In 1792, in concert with many *émigrés*, he joined as a volunteer the Prussian army under the duke of Brunswick, and afterward the Austrian troops under the prince of Saxe-Coburg, participating in the battles fought by both against his own countrymen. On the retreat of the Austrians in 1795, he returned to Russia, where he became a lieutenant-general in 1799, and was made a count of the empire. In 1805, at the battle of Austerlitz, he commanded a division which was almost entirely destroyed; this loss caused him to be for a while disgraced. From 1807 to 1812 he was employed in the Russian war against the Turks. Under Teltchagoff he pursued the remnants of the great French army from Russia, and kindly treated such prisoners as fell into his hands. In 1813 he participated in the campaign in Germany, contributed to the victory of Leipsic, and advanced as far as the Rhine. In concert with Blücher, he marched toward Paris, fought in nearly every important battle during the "campaign of France," and was present at the first occupation of the French capital. In 1815 he was appointed governor of Cherson and the Crimea. He caused Odessa to be made a free port, and received in 1822 the title of governor of New Russia. The next year he lost Alexander's good graces, and was recalled to service only on the accession of Nicholas, whom he accompanied to Moscow to be present at his coronation. In 1828 he served in the war against the Turks, was intrusted with the defence of Wallachia, worsted the enemy in several encounters, and received the command of all the Russian troops in the Danubian principalities; but Diebitch having been promoted to the chief command, Langeron, who was his senior in rank, declined serving under him, and retired to St. Petersburg.

**LANGHORNE, JOHN**, an English poet and miscellaneous author, born in Kirkby-Stephen, Westmoreland, in 1735, died in Wells, Somersetshire, in April, 1779. He took orders, and afterward went to Cambridge, where he supported himself by teaching in a gentleman's family. On account of an unfortunate attachment to the daughter of his employer he left his situation and went to London, where he wrote for the periodical press, obtained the curacy of St. John's, Clerkenwell, and was appointed by Dr. Hurd assistant preacher of Lincoln's Inn. In 1765 he published a short poem entitled "Genius and Valor," to defend the Scotch against the aspersions of Churchill; for this he received the degree of D.D. from the university of Edinburgh in 1766, and in the following year he married the lady to whom he had previously paid unsuccessful suit. She belonged to a wealthy family, and the living of Blagden in Somersetshire was purchased for her husband; but she died within a year in child-

bed. Langhorne then removed to Folkestone, where, in conjunction with his brother William, who held a curacy in that town, he wrote his translation of Plutarch's "Lives" (1771), the work by which he is best known. He married again, and lost his second wife also in childbed in 1776, an affliction which is said to have led him into intemperance. In 1777 he obtained a prebend in the cathedral of Wells. He was a voluminous writer of tales, short poems, and sermons, which are little valued. A collection of his poems with a memoir of the author was published by his son in 1802.

LANGLANDE, LANGELANDE, or LONGLAND, ROBERT, the supposed author of the "Vision of Piers Ploughman," born in Okebury Mortimer, Shropshire, in the first half of the 14th century. Nothing is known of him except from traditions current at least as early as the 16th century, according to which he was educated at Oxford, and became a monk of Malvern. The familiarity of the author with the Scriptures and the church fathers indicates that he was an ecclesiastic; several local allusions in the poem, and the fact that its scene is the "Malverne hilles," prove that it was composed on the borders of Wales; and internal evidence fixes its date at about 1362. It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical descriptions the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, it presents the simple ploughman as the embodiment of virtue and truth, and the representative of the Saviour. Its ancient popularity appears from the large number of MS. copies which still exist, most of them belonging to the latter part of the 14th century. It was a favorite of religious and political reformers, and several imitations of it appeared, the most important of which was "Piers Ploughman's Crede," written about 1398 by some Wycliffite, assailing the clergy, and especially the monks. In 1550 the "Vision of Piers Ploughman" was printed by the reformers, and so favorably received that 8 editions were sold within a year, and the name of the ploughman is often introduced in the political tracts of the 16th and 17th centuries. This poem is a remarkable example of a system of verse, derived from the Anglo-Saxons, and marked by a regular alliteration instead of rhyme. There are two classes of manuscripts, which give the text with considerable variations. The best edition both of the "Vision" and the "Crede" is that of Thomas Wright (2 vols., London, 1856), with notes, a glossary, and variations.

LANGLES, LOUIS MATHIEU, a French orientalist, born near St. Didier, Aug. 23, 1763, died Jan. 28, 1824. He studied Arabic and Persian under Silvestre de Sacy, and in 1787 published a French translation from the Persian of Tamerlane's "Political and Military Institutes," sup-

posed to have been written by Tamerlane in the Mongol language. He was intrusted with the publication of the Mantchu-French lexicon by Father Amiot, which he accomplished with accuracy and success. He induced the French republican government to establish the special school of oriental languages, which is still in existence. He was appointed its first administrator, and professor of the Persian, Malay, and Mantchu, but he taught only the first of these languages.

LANGRES, a fortified town of France, in the department of Haute-Marne, built on a steep hill on the left bank of the Marne, on the railway from Paris to Muhlhouse, distant from Paris 185 m.; pop. in 1856, 8,570. Next to Briancon it is the most elevated town in the empire. The most important manufacture is cutlery. Langres has been the see of a bishop since the 8d century.

LANGTOFT, PETER, an English chronicler, so called from the parish of Langtoft in Yorkshire, flourished in the latter half of the 13th century and the commencement of the 14th. Little is known of his life beyond the fact that he was a canon regular of the order of St. Austin, and produced a translation from the Latin into French verse of Bosenham's "Life of Thomas à Becket," and a French metrical "Chronicle of England," from Trojan times to the end of the reign of Edward I. The manuscripts of the latter are preserved in the Cottonian collection in the British museum, and among the Arundel manuscripts in the same repository. The "Chronicle" has been rendered into English verse by Robert de Brunne.

LANGTON, STEPHEN, an English prelate, born probably in the first half of the 12th century, died in Slindon, Sussex, July 9, 1228. He was educated at the university of Paris, and eventually became canon of Notre Dame and chancellor of the university. Visiting Rome in 1206, he was made a cardinal by Innocent III., and in the succeeding year was consecrated by him archbishop of Canterbury, to which see he had been elected at the recommendation of the pope, and in opposition to the claims of John de Gray, whom King John of England had compelled the monks of Canterbury to elect. This circumstance gave rise to the quarrel between John and Innocent, one of the consequences of which was that Langton was kept out of his see until the submission of the king to the pope in 1213, after which he was acknowledged archbishop of Canterbury. In the same year he joined the confederacy of barons opposed to the misgovernment of John, and at a meeting of the heads of the revolt in London urged the restoration of the charter of Henry I. He adhered faithfully to his party throughout the struggle, and for his refusal to excommunicate the barons, at the command of Innocent, was suspended from the exercise of his archiepiscopal functions. Little is known of his subsequent history. He was reputed a man of great learning, and was the author of several theological treatises.

**LANGUAGE** (Lat. *lingua*, anciently *dīngua*, tongue), in general, the manifestation of human thoughts and feelings by articulate sounds. The various names which designate it are derived in most languages from roots signifying the functions and properties of the tongue: thus, Arab. *lisān*, language, *laqlaq*, tongue; Armen. *liseru*, Slavic *iasik* (originally *liae-ik*), from Sans. *liṣ*, to lick, taste; Lat. *loqu-ela*, of the same root as Gr. *λογος*, speech, reason; Sans. *rasat*, speaking, sounding, and *rasana*, sound, tongue, taste, from *rasa*, to sound, taste; Gr. *γλωσσα*, tongue, language, analogous to Slav. *glos*, *hlās*, sound, voice, Welsh *llais*, voice, and Coptic *lus*, language. Wilhelm von Humboldt defines language to be "the breaking forth of the power of speech, according to the mental cast of a people," thus giving a paraphrase of the German *Sprache* (composed of *aus*, out, and *brechen*, to break), analogous to the Anglo-Saxon *spæc*, speak. The Latin *sermo*, discourse, consists of *ser-ere men-tem*, to sow or scatter the mind; thus, also, *di-ser-ere*, to sow or scatter about, to discourse. The German *Rede*, speech, coincides radically with the Greek *ῥέω*, to flow, speak, and *ῥήσσω*, to break forth, proclaim, whence *ῥήτωρ*, speaker; and with the Latin *reor*, to think, and *ratio*, reason. The French *parole*, and Spanish *palabra*, word, come from the Latin *parabola* (Gr. *παράβολη*), a comparison. These and all other words in other languages, derived from the name of the tongue, are symbolic, and serve as examples of the formation of words in general. While synonymous or related in respect of signification, they are heteronymous or heterophonous according to the radical sounds or syllables from which they are derived.—Philology is a term concerning the meaning of which there is little agreement among its votaries. Plato meant by it love of speech, Socrates love of philosophical discussion, Isocrates and Aristotle love of knowledge, and the Alexandrians love of books. The Romans translated it by *eruditio*, *doctrina*, *literarum studium*, and *cognitio*. In the middle ages it was applied to the study of Greek and Latin writers, or to the knowledge of languages and archæology in general. To Fr. A. Wolf, it was all learning pertaining to Greek and Roman antiquity; to Boeckh, the knowledge of the whole life and activity of any people at any definite time; to Matthiæ, the study of the Greek and Latin languages and antiquities; to Müttzell, the science of verbal signification, or of the manifestation of the human mind by language; to K. O. Müller, the history of mankind and the full conception of ancient spiritual life; to Schelling, the construction, history, and contemplation of works of art and science; and to Milhausen, the science and art of education, or of conveying instruction to others. Others define philology as research into the languages of cultivated nations, and into language as such, in order to recognize from its essential characteristics the nature of our intellectual powers. Others restrict it to certain particular languages, as for

instance to the Hebrew, qualifying it by the epithet "sacred." Modern writers especially limit the term to such languages and literatures as have attained a permanent form, and are not subject to further fluctuations. Ancient philosophy comprehended what we now call physiology, psychology, and philology. To avoid ambiguity it would be advisable to call the science of language glossology, under which are included both the nature of language as such, and its various developments by different nations in particular languages, examined with a view to acquiring a knowledge of the laws of the human mind. Philology is thus confined to the study of written monuments.—Grammar, as usually defined, is the art of speaking and writing correctly, and embraces the rules for the proper use of any language. It was one of the 8 branches of the *trivium* of the middle ages, which with the 4 branches of the *quadrivium* constituted the 7 liberal arts of the Alexandrian Greeks. It is commonly divided into 5 parts: orthoëpy (right speaking); orthography (right writing); etymology (derivation of words); syntax (Gr. *συν*, together, and *τάσσω*, to put), which treats of the structure of sentences; and prosody (Gr. *προς*, for, and *ᾠδή*, a song), which treats of the quantity and accent of syllables and the laws of versification. Beside the special and peculiar grammars of each language, the science of comparative, historical, or philosophical grammar has in the present century made great progress. It treats the essential and common characteristics of human expression, the whole art of the communication of thought by signs. In its widest compass, it gives the analysis of every sentence, shows the several classes of words which correspond to the several classes of ideas, and the various modifications which words receive, or the different modes of arrangement of which they are capable, in order to express all the modifications of thought; it considers alike speech, writing, and gesticulation as modes of expression, each of which it aims to decompose into its simplest elements; it follows words through all their transformations and compositions, and penetrates to the simple and fundamental ideas represented by their roots; it develops the various significations of words, one from another, by virtue of the relation of resemblance or contrast between them, which gives rise to figures of speech; it seeks after the mutual relations of speech and thought, traces the natural symbolism in language, and shows that its formulas are not only means for preserving ideas, but also instruments for acquiring new ones; and it goes back to the origin of language, and by a wide comparison illustrates its growth, common qualities, and various groups and classifications from the remotest time. Though all of these questions form parts of the same science, they have rarely been treated together in grammatical works. The first alone has universally been included; the second has usually been added; Condillac and others embraced also the last. Dumasais was the first

who aimed to treat them all, a project which was more successfully carried out by Court de Gébelin. He decomposed words into their last elements, showed the origin and significance of these elements, and then traced them through various languages. The essential elements of language are substantives and attributives. Every thing else is invented only for ease, despatch, or ornament. Substantives or nouns are the names of objects, of things that either exist or are conceived to exist, and they do not of themselves mark either quantity, quality, action, or relation. They are distinguished as proper, designating single individuals, as Cæsar, Henry; or common, applicable to a class, as animal, house. They may admit of modifications by gender, those which denote male beings being of the masculine gender, those which denote females being feminine, and those which denote neither being neuter. In this respect, most languages deviate more frequently than the English from the order of nature, and make many inanimate substances in which sex has no existence either masculine or feminine. They are modified also by number, to distinguish unity and plurality; and by case, to show various relations between the noun and other words in the sentence, usually indicated in English by prepositions, but in the classical and many other languages by terminations. The pronouns are words invented to sometimes supply the place of nouns. They are short words, having no meaning in themselves, but having the full meaning of the substantive which they represent, the constant repetition of which is thus avoided, when they are substituted for it in the immediately subsequent members of a discourse. Like the noun they admit of number, gender, and case; and they are also distinguished as of the first, second, or third person, according as they designate the person speaking, the person spoken to, or the person spoken of. Attributives are in general words which are not expressive of things that exist or are conceived to exist, but of their quantity, quality, action, or relation. They are either verbs, participles, adjectives, or adverbs. A verb affirms an action, done or suffered, or a state of being, and is accordingly active, passive, or neuter. The condition and time under which this action or state occurs is indicated by modes and tenses. Beside the present, past, and future, there are other tenses, varying in number in different languages, made by combining some conditional circumstance with one or all of the divisions of time, as for instance whether the action is conceived as completed or not at the time spoken of. Both the tenses and modes, the latter of which affirms the action of the verb, either directly, or as a matter of possibility or hypothesis, or as a command or request, have been variously classified. In English there are usually reckoned 6 tenses and 4 modes, which are illustrated in the following 10 forms: I write or am writing, wrote or was writing, have written, had written, shall or will write, and shall

have written; I write, may or can write, write thou, and to write. Verbs are also inflected to distinguish number and person. According to Dr. Hunter, every verb is expressive of an attribute, of time, and of an affirmation, and if the affirmation be taken away there will remain the attribute and the time, which together constitute a participle. The English has the present and the past participle, as writing, written, but no future, which is found in the Greek and Latin. An adjective is distinguished from a participle as implying only an attribute. It designates the qualities, and not the acts or motions, of substances. These qualities being the same, whether in male, female, or inanimate objects, the adjective should strictly admit of no variation for gender, though the English is exceptional in making none. The qualities, however, may exist in different degrees in different objects, and hence what are termed the three degrees of comparison, as wise, wiser, wisest. Adverbs are the attributes of verbs, qualifying the action which they express. They indicate quantity, quality or mode, relation, time, space, &c., as moderately, quickly, more, when, upward. Auxiliary parts of speech are the article, conjunction, preposition, and interjection. The article defines and points out objects as distinguished from others of the same class. The indefinite article "a" or "an" separates but a single unspecified object from the class to which it belongs, and cannot be applied to plurals. The definite article "the" is applied specifically to one or more objects, pointing them out as those of which alone in their class something is affirmed or denied, and therefore belongs equally to both numbers. Conjunctions conjoin sentences, prepositions conjoin nouns and pronouns, and interjections are unconnected words, having no relation to the syntax of a sentence, the instinctive and inorganic utterances of sudden sensation or vehement passion. Horne Tooke describes them as the brutish and miserable refuge of the speechless, and says that the whole dominion of language is erected on their downfall. In the Chinese grammatical system, every root is a word, and obtains the character which we denominate a part of speech merely by its position relatively to the other words in the sentence.—Etymology (Gr. *ετυμολογια*, true, from *τυπνω*, to strike, print; hence, imprinted, true to the original) is that branch of glossology which relates to the origin of words. As one of the parts of grammar, it is restricted to the theory of inflections, that is, to the declension of nouns, the declension and comparison of adjectives, and the conjugation of verbs. Etymon is the term used to designate the type of the root, i.e., its essential form; thus: Gr. *μορφη*, an anagram of the Latin *forma*; Ger. *Topf*, inverted in the Eng. *pot*. Many words in all languages are mere dead matter, incapable of analysis, and imported with the things they are used to name, just like labels affixed to articles of merchandise. Such are, from names of places, bayonet, from Bayonne; calico, from Calicut;

milliner, from Milan; pistol, from Pistoja; china, nankin, arras, &c.; from names of men, guillotine, mackintosh, silhouette, raglan, &c. Many are quid-pro-quoas, as horse radish instead of mer radish or sea root (from *radix*, root, preceded by *mare*, sea, mistaken for the English word of the same form); rosemary, from *ros marinus*, sea dew, and not from *rosa Maria*; butterfly for flutterfly; buck-wheat for beech-wheat (Anglo-Sax. *boe*), &c. Many are regarded as Anglo-Saxon without being so in fact, as butter, from *bovs* and *rupor*, cow-cheese; and squirrel from *σκίουρος*, shadow-tail. Many words of the same form come from different etyma; thus, sound, from *sanus*, healthy, *sinus*, gulf, *sonus* (*tonus*), noise, *fundus* (Fr. *sonder*), depth; Ger. *kosten*, from either Lat. *gustare*, to taste, or *constare*, Ital. *costare*, to cost.—Speech is the characteristic of man. According to Jean Jacques Rousseau, culture is indispensable to the contrivance of language; but language is not less necessary to the development of culture. Unable to solve the problem of the origin of language, Plato supposed it to be divinely inspired. The same view has not been uncommon among Christians. But Democritus, Epicurus, and Cicero among the ancients, and Monboddo, Adam Smith, Dugald Stewart, and most modern scholars, favor the natural creation of speech by the innate faculties of man. The records of history give little light on the subject. Plato and the other Greek philosophers were disqualified for obtaining an adequate view of the nature of language by the patriotic narrowness which made them look with contempt on foreign nationalities. Some great principles of glossology are however found in Plato's "Cratylus," a disputation between Socrates, Cratylus, and Hermogenes on the propriety of names. Cratylus asserts that every thing has a name belonging to it by nature, and not by an arbitrary convention. Word-framers, who express the connection between vocables and objects, are regarded as the rarest of artists. Homer distinguished the names given by the gods from such as are used by men: "whom the gods call Xanthus, but men Scamander." Some of the examples of etymology given in the "Cratylus" are superficial, and some profound; thus: *ψυχη*, soul, from *ψυει οχει και εχει*, it conveys and keeps nature; *χρονος*, time, from *κρουει-ος*, stream, equivalent to Ger. *ge-ron-nen*, run; *Πλουτων*, from *πλεος*, full, and *δουναι*, to give. An influence on the formation of words is attributed to gesticulation; sagacious hints are given on the meaning and changes of sounds; and barbarian languages are justly appreciated for the natural significance of their words. Pythagoras, when asked what being he thought to be the wisest, replied: "First, the number, and secondly, that which has given names to things." By the former he meant the word, by the latter the soul. The words for number, word, and god all have the same root, *κν* or *γν*, as in the words *numerus*, *nomen*, and *numen*. The guttural sound, which disappears in these examples, re-

mains in *γνωμη*, *cognoscere*, Ger. *kennen*, and Eng. *know*, which are akin to *gignere* and *generare*.—Manifold opinions have been advanced concerning the original language. Herodotus relates that Paammetichus, wishing to learn which was the first language, ordered two babes to be brought up without ever hearing a human sound. They were nurtured on the milk of goats which were brought to them to suck, and after two years pronounced first the word *bekas*, which in Phrygian meant bread. The Egyptians, therefore, according to Herodotus, admitted that the Phrygians were more ancient than themselves. The preëminent antiquity of the Hebrew has been often maintained; that of the Greek by Peteric, Latin by J. Hugo, Cymbric by Mylius, Scythic by Bodhorn and Saumaise, Ethiopic by Reading, Chinese by J. Webb, Basque by Larramendi, Breizad by Latour d'Anvergne, Flemish by Van Gorop, Swedish by Rudbeck and Strjernihjelm, and Celto-Scythic, the mother of the Slavic, by Kirchmayer. Grotius, De Gëbelin, and others, find traces of the primitive language in all others. It was the opinion of Klopstock that writing and language were invented together and simultaneously by several nations. The roots of languages shed much light on the operations of the human mind. The following are examples taken from the languages most generally known: *Sent-ire*, root *set*, analogous to the compound *ta-n-g-ere*, *tao-tus*, touch; *in-stinct*, stung-in, *in-tu-eri*, &c. *Per-cip-ere*, seize through; Ger. *emp-find-en*, to find-in, *An-schau-ung*, on-see-ing, &c. *Intel-lig-ere* (inter-lig-are), to under-stand, Ger. *Ver-stand*, and *Ver-nun-ft* (*ver-nehm-en*, *per-cip-ere*, though used for reason); *co-git-are* (*cum-agit-are*), *con-tem-pl-ari* (*cum-ten-dere* and *plus*). *Ju-dic-are* (*justum indic-are*); Ger. *Ur-theil* (or-deal); *κρινειν*, dis-cern-ere; *re-præ-sent-are*, Ger. *sich vor-stell-en*; *re-flect-ere*; *con-cip-ere*, Ger. *be-greif-en* (be-gripe); *denk-en* (to think), of the same root with Lat. *doc-eo*, *dic-o*, *doc-eo*, *δωγμα*, Eng. *tok-en*, *sig-num*. *Γινωσκα*, *co-gnosco*, *cen-seo*, Eng. *ken*, *know*; and *διαβαια*. Lat. *sci-o*, whence Eng. *ski-ll*, separate. *Med-itari*, *met-iri*, *men-s-urare*, *med-ius*, *mod-us*, *mod-ius*, &c., the root of all of which signifies middle, and therefore measure; hence *mens*, *mon-eo*, Ger. *mein-en*, *Mann*, *Men-sch*; Eng. *mind*, *mean-ing*, *man*; Lat. *ho-mo(n)*, *hu-man-us*; for man is the measurer with his *men-s* (mind) and *man-us* (hand). Romanic *pens-are*, from Lat. *pend-ere*, *pond-erare*, to weigh, and *in-tend-ere*, to apply (from *tend-ere*, at-tend-ere, to stretch), that is, to stretch the power of the mind. Gr. *Ειδω*, Lat. *vid-eo*, and *iden*, Ger. *wis-sen*, Eng. to *wit* and *wise*; Sans. *vid*, Zend. *veed*, Slav. *vid-eti*, to see, know; hence *veda*, science, and Sans. *budh*, to discern, &c. These words are examples of two important principles in the labyrinth of languages, namely: that all so called metaphysical terms are in reality metaphorical expressions of material acts and properties to which the mind likens its own operations; and that languages do not diverge in the

expression of the single categories of sensible things, but only in the application of these primitive expressions as names to other things. Both primitive and cultivated men are impressed by the same peculiarities of things, but the latter depend mostly, not on what the mind produces by its own exertion, but on what they receive passively as imposed on them by society. Primitive men were more sensitive and perceptive, and almost simultaneously reacted on their experiences. Their language was spontaneous and almost simultaneous with the impressions made by objects. Hence their expressions were true etyma, or imprints on the mind, shown externally by vocal sounds. The uses of these etyma are modified with the progress of culture. As each true word, in its original acceptation, coincides with the feeling or idea that gave it birth, and as men vary in the cast of their sensibility and mind, the uses of the etymic words are various. Language in its totality, as well as every fibre of it, is a symbol of mental activity and a mediator between different minds. Man is a mirror of all objects; he digests and assimilates in his mind the material furnished by his senses, and then communicates it by speech. Language, therefore, is the acme of all human energies, a memento of all times passed by a people and by each man; their monument after both disappear from the theatre of life. The deeds of men are strung on it, like beads on a thread. Our present social, religious, political, scientific, and artistic culture is the complicated result of all that has been lived through by our common ancestry; only mixed, digested, filtered, modified by the assimilating power of time. If even the works attributed to Orpheus, Homer, Manu, Vyasa, Valmiki, Ossian, Shakespeare, and to the author of the *Nibelungen-Lied*, are each suspected to be the effusions of several men, how could we now disentangle the conglomerate mass of all languages into the several contributions by each nation or genius? Speech, as a necessary function of the human faculties, arose instinctively, and single languages were formed by the peculiar choice or caprice of their speakers, as influenced by various agencies. Every people, according to its own genius, amalgamates the phonetic element with its own feelings and conceptions into an organic unity. The forms of language also react on the mind. Our very thoughts are faint without their union with the symbols of speech; the operations of the brain and heart, the articulations of the vocal organs, and the reception of sounds by the ears, being an inseparable synergy. Thought crystallizes the momentum of the mind and utters it as a word; and the atmospheric air is made to vibrate with mental energy. Speech is as much a function of thinking as breathing is of living. It is not a mere means of intercommunication, but also of self-instruction. The peculiar qualities of objects lead us to distinguish, while their common qualities lead us to combine. We ever strive after a clearer and more comprehensive unity. The sound is the

symbolic representative of the object, of its mental picture and of the sympathetic effort of the organs both of speech and of hearing. In no other product of mental activity is there a more complicated quantity of well defined modifications, than in this trinity of object, mind, and voice, one and indivisible. The word itself becomes in its turn a new outward object, linking the world with man and men with each other. Speech is developed only in society, and men can neither understand themselves nor their own ideas fully except by trying the intelligibility of their words on each other. Mutual understanding sharpens the intellectual powers of speakers, so that with the increase of social intercourse the language gains in perfection. The power of thinking needs to be kindled by the homogeneity of general thought, and tested by the heterogeneity of individual thought. By society and by schooling a whole people becomes habituated to the limits of the preëxisting language, whatever that may be. Since every nation exhibits in its language its peculiar intellectual and sensitive characteristics, the acquisition of a foreign language affords us a new point of view, from which we perceive some features of the world more clearly than by means of our vernacular.—Without entering upon the anatomy, physiology, and acoustic theory of the organs of speech, it is sufficient to remark here that they consist of what may be termed three sluices which intercept and modify the column of air breathed from the lungs. The most complicated of the three organs is the *guttur*, vaguely named throat (and even palate by some). The tongue, though the most glib part, is unable of itself alone to interrupt the air, and needs the coöperation of the immovable teeth, with which it forms the second sluice. The lips constitute the outward gate. The *guttur* communicates with the legitimate passage of air through the nose, which, however, is a mere accessory. The voice (Lat. *vox*, a collateral form of *fauz*) is a sound produced in the throat by exhaled air, and further modified into specific sounds by the organs of speech. All the elementary sounds in speech are either vocals (vowels, *στοιχεῖα φωνηέντα*) or articulated, organic (consonants, *συμφωνά*). Owing to the solidarity or mutual influence of the organs, while engaged in their several phonetic functions, the exact number of the sounds found in all languages cannot be absolutely fixed. It may amount to 50, inclusive of all shades; Volney exaggerates it to 60. The following table exhibits the modifications of the organs while the 5 vowels are produced, giving to them what is termed the continental pronunciation:

	I	e	A	o	U
Aperture of mouth	3	4	5	2	1
Width " "	1	2	3	4	5
Fancces .....	highest	midling	lowest—Chladni.		
Tongue .....	raised	easy	low—Krug.		
Lips .....	expnd'd	pointed	backward		
Tongue .....	forw'd	...	...		

Boeckh.

The mutual relations of the vowels are exhibited in the following scheme:

Floerke arranged the vowels on the musical scale thus:

u o a o ē ē ū e i  
O G Ū ē flat F G A Ū

The following analogies may be drawn between the vowels (according to the continental pronunciation) and the categories of things:

I, red, triangle, hot, sharp pain.  
A, yellow, circle, temperate, health.  
U, blue, square, cold, dull pain, shudder.  
e, orange, trapezium.  
o, green, ellipse.

The vowels express instinctive emotions, as in interjections; they are, so to speak, the cellular tissue in the body of language, the potential element in the genesis of consonants; they render the consonants utterable as syllables, making speech organic, being as it were the cement between the consonants. They make a language musical, and embellish it, unless used in profusion. They are also grammatical and phonetic expedients. They do not betoken clear conceptions, although F. Bopp and others assert the contrary. In the more cultivated languages they are mere fragments of words or of decayed consonants; thus: Eng. *I*, for *io*, *ego*; *a*, for *an*, *one*; Ital. *o*, for *od* (Lat. *aut*), and *e* for *ed* (Lat. *et*); Fr. *a*, has, and *y*, there. *J* and *y* are changes from *c* and *g*, as in Fr. *fait*, *royal*, from Lat. *factum*, *regalis*; Eng. *said*, *say*, *flail*, from Ger. *sagte*, *Flegel* (Lat. *flagellum*); Ger. *gebenedeyt*, from Lat. *benedictus*; *u* and *w* also are changes from *c* and *g*, as in Portug. *doutor* from Lat. *doctor*, Ger. *bauen* from Lat. *pacum* (*pango*), and *Frau* from Lat. *Virgo*; they are substituted also for *b*, as in Span. *deuda*, Lat. *debitum*. These examples betray a near affinity of the extreme vowels with gutturals, a phenomenon most remarkable in the Arabic *ain* and *ghain*. The *I* and *U* also become collateral consonants, as *J*, *V*, and *W*. The indifferent sound, which Lepsius calls the father of the other vowels, and which is, as it were, the nebular matter of all the utterances of the human voice, is the French so called mute or feminine *e*. It is represented in Hebrew by the *Sheva mobile*, indicated by two dots placed vertically under the consonant. It is a free, easy breathing, a sigh-like sound. It is the gray color in

speech. The alphabet, as now used by the English, Germans, and some other European nations who have added *J*, *K*, *U*, *W*, *Y*, and *Z* to the Latin of the golden age, may be thus arranged:

ELEMENTS.

Musical.	Logical, articulated.			
Vocals.	Labials.	Gutturals.	Linguals.	Dentals.
A	B	C		D
e	f	G h		
I (y)		j K	L	
	M		N	Liquids s T
o	P	Q	R	
U...	v...	w	X	
(y)				z

The letters in capitals designate the essential sounds. *A*, as the central vowel, leads the alphabet; *I* and *U* are the extreme vowels; *C* (*K*, *Q*), *P*, and *T* are the consonants *tenues*. Next in importance are *G*, *B*, *D*, as *consonantes mediae*. The weakest are *h*, *f* and *v*, *s* and *z*, as *aspiratae*. The liquids are *L*, *M*, *N*, *R*. The recently contrived vocal consonants are *j* and *w*. The *y* is placed after the *I*, to show that the English use it instead of the German *j*, and also as a substitute for the Greek *γ*, as well as for other vowels; thus: *yes*, Ger. *ja*; *say*, mighty, modesty, from Ger. *sag-en*, *mächtig*, Lat. *modestia*; and for the Greek *υ* as well as *εια*, as in *sympathy*. The *X* is cut in twain, since it is a sign of the double sound *ca*. The *N* is on the same line with *X*, without being severed, to show that it belongs to both conterminous columns; for it is akin as a liquid to *L*, *M*, and *R*, while it is the representative of nasality and the genuine sign of negation. It is a sort of electricity among the sounds of language, and as such is represented in 5 ways in the Devanagari (as guttural, palatal, dental, cerebral, and *asthnavāra*). In Portuguese it is often marked by a *tilda*, in Arabic by the doubling of the three vocal sounds, called nunnation; and in Greek it is written *γ* before gutturals, as in *αγγελος*, angel. The horizontal lines also offer analogies. The upper line contains the essential elements of the whole alphabet; the consonants of the second line are often interchanged, and *gh* in many English words is pronounced like *f*; and the liquids have peculiar affinities. The languages of the South sea islanders and of many of the tribes of American aborigines abound in vowels. The consonantless Greek words *aei*, *aiw*, *ew*, *oiw*, &c., originally began with a labial aspirate or a digamma. The most vigorous and significant words are those which grow from a guttural germ. From the original laws of vocal expression, the significance of elementary sounds may be determined, and the character of a language may be evolved from its alphabet. The name alphabet was first introduced by the fathers of the church.—Those nations which have acted the most prominent parts in history speak the languages which

contain most of the organo-genetic elements, or germs of words, in the simplest and least disguised form. These languages are irrefragable proofs of the highest intellectual and æsthetic development under the most favorable circumstances. Preëminent in this respect is the Indo-European family. All genuine roots are monosyllabic. The rabbinical theory of dissyllabic roots rests on a hypothesis, and mistakes root for theme. Roots, stems, themes, etyma, &c., are too commonly confounded. There are no specific roots in specific languages. Germ is a fitter term, as it includes complex so called roots and themes, and answers to what G. Stjernhjelm described as *materia prima, quæ capax omnium formarum, nullique perpetuo pertinet, ipsa in casu immobilis*, &c. H. H. Wilson says: "The *dhatu* or radical of the Sanscrit, although in strictness it fulfils no specific grammatical function, and is equally the theme of a noun as of a verb, may be most conveniently considered as identical with the latter, as the crude verb. . . . As arranged in the glossaries of roots, it is usually interpreted by an active or abstract noun in the locative case; as *gam-gatau*, in going; *chû-satâ yân*, in being, &c.; intimating one general idea to which the different modifications in its derivatives may be referred." All the roots, with a few doubtful exceptions, as *ândol*, swinging, *kumâl*, playing, &c., are monosyllables; many of them are uniliteral, as *î*, going, *ri*, injuring, &c.; the greater number, however, terminate in consonants, as *tark*, discussion, *gadsh*, sounding, &c. The whole number is about 1,900. In the original lists the roots have attached to them supernumerary letters, as signs of the class of conjugation, or of peculiarities of inflection. Fr. Rosen gave 2,354 Sanscrit roots, of which 1,686 are counted once, and 718 twice or several times, with various significations. Roots are deduced from derivatives; some are substantives (as *mud*, joy) from infinitives of verbs. Some Sanscrit roots contain 4 consonants, as *mra-k's*, to anoint. The following will serve as other examples: *ni*, to draw (Lat. *ne-re*, to spin); *tri*, to go over (Lat. *tr-ans*); *gai*, to sing (Lat. *ca-nere*); *ed*, to destroy (Lat. *de*); *ad* (Lat. *ed-ere*); *arîs*, to honor; *pat* (Lat. *pet-ere*), to fall; *evap*, Lat. *evap-or*; *bhaktah*, to eat (Lat. *vesc-i*); *sangrdm*, to fight (Lat. *sim-ul carp-ere*). We need not, however, wander to the Ganges in search of roots, since they may be clearly recognized in the Latin, Celtic, and other European languages of the Indo-European family. Here is one instance: *Cor*, *hear-t*, *cor-a*, *kernel*; *gra-num*, *grain*, *corn*; *gor-men*, and *gor-o*, *car-ry*; *or-eo*, *or-esco*, *gra-ndis*, *gra-dior*, Sans. *kri*, to act, do, make, &c. In short, OR as a root grows from the germs O and R, and is a symbol of the union of the essential element O with the phenomenal R, that is, of creative cause. This is one of many examples which show that we ought to found language on the theory of germs rather than of roots simply. All genuine roots in all languages must be identical. Man has everywhere essentially the same reason, the

same external senses and organs of speech. There is no appeal from an external law. As there are three sluices in our vocal apparatus, so there are three principal vowels, and three groups of articulate sounds. There are also three categories of ideas and of essential phenomena in nature corresponding to the triad of sounds; thus: 1, cause, in, corresponding to gutturality; 2, effect, out, which may be either (1) living, moving, corresponding to labiality, or (2) dead, standing, dormant, corresponding to dentality. The last, however, is alloyed with linguality, in token of there being no absolute death in nature. All geometrical, anatomical, physiological, and other qualities, positions, relations, and functions of the organs of speech, when compared with each other and with the other organs and parts of the human body and with the categories of things external to man, are symbols and prototypes of the significance of the germs of speech. These germs are the canon, all the deviations from which are but degrees of corruption, just as all deviations from a line (superfluously called straight) are degrees of crookedness. The machinery on which languages are racked, and its roots variously modified and combined, consists of the following 11 devices, illustrated by examples: prosthesis (Eng. *g-lad*, from Lat. *lat-us*); aphæresis (Eng. *tin*, Lat. *s-tan-num*); syncope (Eng. *wood*, *weed*, from Ger. *Wald*, *wild*); epenthesis (Lat. *spe-c-u-s*, Gr. *spei-or*); diplasiasmos (Ital. *legge*, *ubbidire*, Eng. *matter*, from Lat. *lege*, *obedire*, *materia*); apocope (Lat. *mol*, Gr. *μολι*; Ger. *bieder*, honest, from ancient *bider-ber*); paragoge (Lat. *decom*, Gr. *deka*; *cant-is*, Welsh *cwn*); synæresis (*Cæsar*, *celestial*, from *Cæsar*, *caelestis*); diæresis (*repeal*, from *re-pel-ere*); metathesis (*corn* for *grain*; *fright*, Ger. *Furcht*); tmesis (*a nag* instead of *an ag*, Lat. *un-us eg-nus*; *an adder*, instead of *a nadder*, Lat. *natrix*). The mind imparts new significance to roots and words by applying them in accordance with their genetic import to new conceptions. Their somatic or literal meaning is transferred into a floating sphere of signification. Thus the words high, top, great, thick, heavy, fat, rich, bright, sweet, sharp, round, and the like, are used in opposition to low, base, little, thin, light, lean, poor, pale, bitter, blunt, flat, to denote every thing in the intellectual and moral realms which the mind conceives to have qualities similar to the qualities of matter designated by those epitheta. Inversely, the application of gross, coarse, though collateral forms of great, may betoken just the opposite of what is venerable. The simple and general idea may be either individualized or assimilated. It is individualized by having its application restricted. The roots or etyma are thus transformed into various distinct words in the same and in different languages. Thus, Lat. *cap-ere* becomes *hab-ere* and Ger. *kauf-en*, &c., which are relatively translated by *wise*, *keep*, *buy*. *Keep* is also translated by *serv-are*, *cap-ere* by *juven*, and *kaufen* by *em-ere* (Anglo-Sax. *big-an*,

whence *buy*, which is *cap-ere* inverted). We thus obtain a series of intermediate meanings and diverse ramifications. The process of assimilation is when one idea is substituted for an analogous one. It is thus that we are all poets without knowing it, and are constantly using figures, tropes, and other stylistic machinery while speaking of trifling objects in the simplest words. Thus, Lat. *ira*, anger, is akin to *urere*, to burn; Lat. *odium*, hatred, *astus*, heat, and Ger. *essen*, eat, are akin to each other (thus we say that fire eats). So also the series *dol-ere*, *tol-erare*, *tol-ere*, and *tul-i*; and *gloria*, *clarus*, *color*, *calor*, Eng. *glare*, *glow*, Ger. *Glanz*, *Gluth*, &c. The genetic symbolism of sounds, things, and thoughts gradually disappeared, as the primordial poetry of the human mind was lost with the progress of fortunes and culture made by single nations and tribes. The generations which followed the first lively movement of the formation of language were bound to and by what their ancestors had accomplished. The tendency which the Greeks designated by *θεσιν* (by position or compact) becomes predominant over the early *φύσει* (by nature). New words, forms, and phrases introduced from foreign languages are assimilated to the vernacular, and adapted to its genius. Instances of this are the languages of western Europe, called modern in consequence of the date of this transformation. Great poets and authors exert a mighty influence upon this change. Could we trace the *papillons* of language from the egg through all their metamorphoses, we should have a historic picture of each respective people. The Chinese and the Sanscrit may be termed the poles in the sphere of language, showing the opposite directions of the one instinct of speech. As nations form various currencies from the same metal by impressing thereon their peculiar figures and devices, so do they frame their languages out of one common material. Leibnitz and others might have saved themselves the trouble of attempting to concoct a universal philosophic language. This universal language is the common basis of all tongues. Were we to lose all speech to-day, together with our acquired false notions concerning it, we should again contrive the same roots to replace it. For language is an organic result under the conditions of wisdom or ignorance, liberty or serfdom, good or bad taste, the glory or the shame of a people. —The number of languages cannot be accurately stated, for several reasons. Some are not known, and of many of the others our knowledge is not minute enough for the purpose of coördinating them; nor are the limits between languages, dialects, idioms, &c., accurately defined. Their number varies also with the different migrations and degrees of culture of races, nations, tribes, empires, &c. Adelung and Vater reckoned 8,064 languages and dialects, and Balbi about 2,000, 860 of which have about 5,000 dialects. Of these 860 there are about 58 in Europe, 158 in Asia, 115 in Africa, 107 in Australia, and 422 in America.

There is no prevalent system of classification either of languages or of races of men. As regards the area or distribution of languages in space, there are very widely extended regions with uniform or kindred languages, as the Slavic and Malay; while some small regions comprise many languages, as the Caucasus, northern California, and the country of the Orinoco. Languages are variously estimated when considered from different standpoints. They are either the parent of others, as Latin and Sanscrit, or derived from others, as French, Spanish, and Hindostanee; vernacular (native), or acquired by instruction or intercourse with strangers; popular (vulgar), as Prakrit, or learned, as Sanscrit; pure, as Chinese, or mixed, as most of the languages of Europe, the *lingua franca*, that of the Moors, and that of the negroes of Demerara (Dutch, French, Spanish, and Portuguese); living or modern, which continue to be spoken, or dead, as the Zend, Median, and Phœnician, or ancient, as Latin and Greek; sacred, as the Sanscrit, Hebrew, Latin, old Slavic, or profane, as the German and French; written or unwritten, as those of savages. A language may also be artificial or factitious, as the *Balaibalam*, contrived by Sheik Mohyi-Eddin in the first half of the 18th century, the grammar and dictionary of the imaginary language of John Wilkins (1668), and others. A strictly scientific classification of languages is yet a problem. F. Schlegel proposed 8 groups: the monosyllabic, disyllabic, and trisyllabic. A. Rémusat endeavored to demonstrate that none were monosyllabic, while W. von Humboldt affirmed that all arose from monosyllabic roots. Most of the names of nations are arbitrarily imposed, some by foreigners from hatred, others by natives from vain-glory; thus, the Samoyedes (self or man-eaters) are so called by the Russians, but they name themselves *Khassoos*, men; the Slavi call themselves so from *slavo*, word, or *tehtloviek*, speaker, man; and they give to the Germans the designation of *Niemty*, mutes. Hayduk means robber; Bedouin, nomad; Frank, freeman, &c. The Osmanli, Usbeks, and Germans (*Deutsche*) so name themselves from their heroes. The Poles are named from *pole*, field; the Croats from *gora* or *karpai*, mountain. H. Steinthal distributes all languages into 18 groups, in 2 sections, viz.: A. Matter confounded with form: 1, no grammatical categories, only juxtaposition, as the Indo-Chinese; 2, no categories, but conjugating, some determining the relations by formation, some by prefixes or by adding vowels to roots, as the Malay and Polynesian; 3, languages of the Caffres and negroes of Congo; 4, category of being separated from that of activity, either by the combination of roots with the substantive verb, or by terminations, as the Mantchu and Mongolic; 5, Turkish dialects; 6, Ural (or Finnic) dialects. B. Matter separated from form: 1, without distinguishing the noun from the verb, mere juxtaposition, as the Chinese; 2, incorporating words, as the Mexican; 3, combining many words, as the languages of

North America; 4, distinguishing noun from verb, as the Basque; 5, accumulating, as the Egyptian; 6, inflecting, with internal conjugation, as the Semitic languages; 7, inflecting completely, as the Aryan (Indo-European). We might make three divisions, according to the internal laws of the formation of speech, characterized respectively by: 1, internal flexion, with grammar and syntax; 2, unaltered words, with a strict syntax; 3, external addition or agglutination, with syntax. Considering, however, the diverse views of the most competent authors, the following classification will most nearly meet the demands on it. An assemblage of kindred languages is called a family or stock, *souche* by the French, and *Stamm* by the Germans, of which we may make 12, although the languages of America and Africa admit of subdivision into families: 1, Chinese, on whose essentially monosyllabic character Bergmann, Rémusat, and others raise some doubts, stating that its original words lost the final consonant in a manner similar to the French *il vient chez eux*, pronounced *i vie ah è zò*; 2, Thibetan, with the Tangutan (of Sifan), containing some Chinese words, and related to the idioms spoken about the sources of the trans-Gangetic rivers; 3, Indo-Chinese (see INDO-CHINESE LANGUAGES); 4, Japanese (see JAPAN, LANGUAGE OF); 5, Dravidan (see INDIAN LANGUAGES, ASIATIC); 6, Tartaric, a very extensive family, which according to some writers includes the Thibetan, and according to others the Tungusic, Mongolic, and Turkish families; 7, Uralic, or Altai-Uralic, Ugric, Finnic, and Tchadic; 8, Indo-European (see INDO-EUROPEAN LANGUAGES), to which may be attached the Caucasian group; 9, Arabic, or Semitic (see SEMITIC LANGUAGES); 10, Malay, to which we attach the Polynesian; 11, American (see INDIANS, LANGUAGES OF THE AMERICAN); 12, African. The terms Iranian, as a name of the Indo-European family, Turanian, as that of the Tartaric, Uralic, Dravidan, and other families, and allophylic (*ἄλλος*, other, and *φύλη*, tribe, nation) employed as a synonyme of the latter, are vague. Every language is allophylic to all others.—The intimate connection of philology with glossology makes it impossible to separate their history, which begins with the edition of the Homeric poems by Pisistratus (about 550 B. C.). The outline which follows may be traced out more minutely by referring to the articles on distinguished scholars, on particular languages, and on associated subjects, as LITERARY HISTORY. The sophists were the first to investigate the laws of grammar and critically study ancient poems. Plato discussed the origin of language and the influence of Homer, especially in his "Cratylus." Aristotle's theory of language was the basis of all kindred inquiries before the opening of the Sanscritic mine. Philology became a specific pursuit about 300 B. C. at Alexandria, and about 160 B. C. at Pergamus, two rival cities in the arts and sciences. Eratosthenes of Cyrene (born 276 B. C.), the great astronomer and historian, is recorded to have been the first philo-

logian. Ezra began to collect the Jewish sacred books about 446 B. C. The Pentateuch was translated into Greek at Alexandria (about 270 B. C.) by the so called *septuaginta*. Other books were added to the canon at Jerusalem, which were also translated. Book-learning, under the name of polyhistory, predominated at that time over real knowledge. Greek literature was domesticated at Rome by Greek grammarians and philosophers. Attæus Philologus wrote an enormous miscellany under the title of *ῥαλῆ*, "Matter." After the spirit of classical culture had departed, grammar, rhetoric, and verbal criticism were still cultivated under the Roman emperors in the schools of Athens, Rhodes, and Marseilles, Julius Pollux (about A. D. 150) compiled an *Onomasticon*. Others, most of them Asiatics, wrote on various subjects connected with language; thus, Origen (born 186) was the founder of biblical hermeneutics; Longinus (executed in 278) wrote on philology, Homer, rhetoric, and composition of words; Porphyrius or Malchus (born 238), author of the *Φιλολογος ἱστορία*, and of other works on similar subjects; and Proclus (412-'85), the last great Neo-Platonist, commented on ancient writers. The closing of the schools of Athens by Justinian (529) was a deathblow to the native culture of Greek literature, and philosophers sought the patronage of the Sassanides. Capella (close of 5th century) embodied the ignorance of his age in a sort of cyclopædia, and ancient philosophy gave its last sigh in the *De Consolatione Philosophiæ* of Boëthius, who wrote in prison. Nine centuries of imperfect studies of philology follow this event, during which letters are fostered at Constantinople. From Photius (about 870), the great promoter of the schism in the church, whose *Myriobiblon* is a review of ancient Greek literature, till the 15th century, but few learned Greeks were known in Europe, and these chiefly in Italy. Hesychius, Suidas, and other etymologists and compilers of Greek vocabularies belong to this period. The Jews, in imitation of the Alexandrians, comment on their ancient writers at Cæsarea, Tiberias, and Babylon (until 1037), contrive the Mishna, the Gemara, and the Masora, introduce the vowel points into their language, and send scholars to Italy, Provence, and Spain. Haroun al Rashid (786-809), Almamoun, and other liberal Abbasside caliphs ordered the translation into Arabic of all esteemed Greek, Syriac, and Persian books, protected learned men of every country and creed, and founded schools at Bagdad, Bassorah, Bokhara, and other places, and provided them with great libraries and museums. In Spain, the 2d and 3d of the Abderrahmans (822-'52, 912-'61) and other enlightened Ommyiades vied with the caliphs of Bagdad in encouraging learning, and established and collected libraries for 14 universities, the chief of which was at Cordova. Versions, paraphrases, and imitations of the works of Aristotle by Ebn-Sina (Avicenna), Ebn-Rashid (Averroes), and Moses Maimonides were made known in western Europe. The

Roman Catholic church, neglecting Greek letters, fostered the Latin studies of the Vulgate and of canonical laws. The Benedictines of Monte Casino (founded in 529) and other monasteries copied the best Latin authors. Theodore, an Asiatic Greek, introduced, while primate (868), both Greek and Latin works into England. The venerable Bede in England (672-735), and his disciple Alcuin of York (735-804), patronized by Charlemagne, residing at Tours, promoted the study of the ancients. The crusades (1096-1270) expanded the mind of Europeans, refined their manners by intercourse with the more cultivated oriental nations, introduced many inventions and improvements, and gave an impulse to commerce and geographical researches, which were still further promoted by the conquests of Genghis Khan (1206-'27) and of Kublai (1259-'94), opening a view as far as Japan. In imitation of the Arabs, medical schools were founded at Salerno (1100) and Montpellier (1150), and universities with the faculty of the 7 liberal arts at Paris and many other cities. Roger Bacon (1214-'94) opened new paths to inquiry by the study of nature and the languages. But while most scholars were exhausting their energies in dialectical quibbles, and civil law was studied at Bologna, Petrarch, Boccaccio, and Dante were reviving the genius of the ancient classics. Manuel Chrysoloras (1395) lectured with great success in many cities of Italy on Greek literature. Aurispa and others imported manuscripts. A galaxy of events, restorations, inventions, discoveries, improvements, and institutions of learning, commonly called the renaissance, dates from the middle of the 15th century. About 80 new universities were founded, and the number of public libraries was greatly increased. Prominent among the liberal patrons of learning were Alfonso V., king of Naples and Sicily (1442), Cosmo (1429-'63) and Lorenzo de' Medici (1469-'92), and Matthias Corvinus, king of Hungary (1458-'90). The fall of Constantinople (May 29, 1453) scattered the treasures of Greek lore over Europe. Greek works were printed in Italy in the original and in Latin versions, and Aldus Manutius published nearly 20 Greek writers before the 15th century closed. Johann Reuchlin (1455-1522), admired by J. Argyropoulos for his Latin translation of Thucydides, pronounced Greek like the modern Greeks, and also studied Hebrew. Erasmus of Rotterdam (1467-1536) was graduated as doctor at Bologna, taught Greek at Cambridge, pronouncing it as it is written, esteemed the English next to the Italians in learning, and wrote various works in admirable Latin. Fox taught Greek at Oxford in 1517, where a Greek professorship was established in 1519. Thomas More (died 1535) was a distinguished classical scholar. Peter Martyr, Martin Bucer, and other foreigners taught successfully in England. Sir T. Smith was professor of Greek at Cambridge in 1538, before being secretary of state under Elizabeth. Sir John Cheke, professor of Greek at Cambridge,

became tutor and secretary of state to Edward VI. Roger Ascham was preceptor to Elizabeth and her Latin secretary. George Buchanan (1506-'82) was a great Latin scholar (*ὁ σκοτεινὸν, ἀλλὰ φάος Σκωτίας*, a light of Scotland). Even English ladies were then familiar with Greek, while the learned men of Europe corresponded in Latin. Budé, who commented on the Greek orators, the great scholars and printers Robert and Henry Stephens, Isaac Casaubon of Geneva, and J. O. Scaliger of Venice were promoters of classical learning in France. M. A. Muret, a French teacher in Italy, wrote almost Ciceronian Latin. J. J. Scaliger (1598-1609) commented on many Latin authors, edited Manetho's and Eratosthenes's lists of Egyptian kings, amended chronology, studied Arabic under great difficulties, and introduced philology and archaeology into the newly founded (1574) university of Leyden. Melancthon (1492-1560), successor of Reuchlin at Wittenberg, improved the system of schools, and Luther exalted the High German above the other dialects by his version of the Bible. Francis I., "the father of letters," founded the royal college at Paris. Lord Bacon (1561-1626) laid a solid foundation for science in all its branches by substituting the method of observation and induction for Aristotelian speculation. Richard Bentley (1662-1742), unrivalled in conjectural emendation and keen perception of the genius of the Greek language, was the founder of historical criticism. Barnes, Dawes, Markland, and Porson (died in 1808) carried etymology to a high degree of accuracy. Holland, distinguished for liberty and commerce, became preëminent in learning, thanks to the labors of Hemsterhuys (1685-1766), Valckenaeer (1715-'85), Oudendorp, Drakenborch, and other natives, and to the German Ruhnken (1728-'98) and the Swiss Wyttenbach. Dutch scholarship may be said to have begun with Gerhard Groot in the 14th century. It was sustained by Gronovius, Penzonius, Erpenius, Golius, Schultens, and Reland. The Elzevirs aided all their labors by their typographical enterprise. Germany soon began to vie with Holland, and has maintained since then the front rank in philological studies. Some of her principal scholars are Fabricius (1668-1736) at Hamburg, Gesner at Göttingen, Ernesti (1707-'81) at Leipsic, who defined philology as *studia humaniora*; Heyne (1729-1812) at Göttingen, who brought general literature to bear on philology; Reiz (1733-'90), who introduced a rational in place of an empirical method of grammar; Hermann (1772-1848), the reformer of Greek grammar; F. A. Wolf, who, developing the views of Vico and Villoison, endeavored to prove that the Homeric poems were the product of several authors; B. G. Niebuhr (1776-1831), who, accepting this view and making a further application of it, reconstructed the history of Rome; Schleiermacher, who continued to show the connection between classical studies and modern literature, and comprehensively interpreted Plato;

Boeckh, whose common sense was not overwhelmed by classical lore; and K. O. Müller, whose genial mind was exerted in multifarious researches. Works on mythology, containing much beside classical erudition, were produced by Lobeck, Creuzer, and others. The Germans, however, are surpassed by the English in finished skill and practical mastery over the resources of Greek and Latin learning. Eminent illustrations of this fact are the discussion of the early history of Rome by Sir G. O. Lewis, and the review and analysis of the Homeric poems by the Right Hon. W. E. Gladstone, both finance ministers. Among the most distinguished promoters of oriental learning are Herbelot (died in 1695), Galland, Du Halde, Meunier, Anquetil-Duperron, De Guignes, Thomas Hyde, Edward Pococke, Simon Ockley, Chappelow, Kennicott, Ludolf, Reiske, Michaelis, Eichhorn, Rosenmüller, Gesenius, the great Sylvestre de Sacy, and Freytag. Though not professional philologists, the following great thinkers should be noticed for their important influence on the progress of good taste and philosophy: Leibnitz (1647-1716); Lessing (1729-81), who gave to German literature a native and original character; Winckelmann (1717-88), the historian of ancient art; and Kant (1724-1804), whose definition of language as the organ of thought raised glossology to the dignity of a science (called in German *Sprachkunde*). The foundations of learned societies and libraries are also worthy of notice, as the English royal society in 1662, the *académie des inscriptions* in 1663 and *des sciences* in 1666, the *bibliothèque du roi* in 1687, the royal academy of Berlin in 1700, the university of Göttingen with a philological seminary in 1787, and with a scientific society in 1751, the academy of sciences at St. Petersburg in 1724, and the scientific society at Upsal in 1728, and at Stockholm in 1789. After that of Göttingen, philological schools were established at Erlangen in 1774, then at Kiel, and successively in most of the universities of Germany, and at Dorpat in Russia. On the occasion of the centennial jubilee of the foundation of the university of Göttingen (1837), it was determined to hold assemblies of philologists annually in the principal cities of Germany, the first of which took place at Munich in 1838. By that which was held at Dresden in 1844 an oriental section was organized. The domain both of classical and sacred philology has been surveyed by F. A. Wolf, *Vorlesungen über die Encyclopädie der Alterthumswissenschaft* (Leipsic, 1831); G. Bernhardt, *Grundlinien zur Encyclopädie der Philologie* (Halle, 1882); A. Matthiæ, *Encyclopädie und Methodologie der Philologie* (Leipsic, 1855); and Hanse, art. *Philologie* in Ersch and Gruber's cyclopædia (1847). Boeckh distributes the functions of philology into two groups, viz: A, formal, verbal, consisting of exegesis and criticism, and comprehending grammar, lexicography, and interpretation of texts; B, material, real, containing political history with chronology and geography,

public and private antiquities, mythology and archæology, and history of literature. All these may be also severally entitled grammar, history, and hermeneutics. The aims attained by philology are knowledge of antiquities, aesthetics, ethica, and history. Its sources are manuscripts, books, coins, inscriptions, and all other monuments.—Glossology or idiomology includes all the linguistic results of philology, and examines whatever is living in the organism of all forms of speech, whether pertaining to ancient or modern, powerful or weak, sacred or profane, civilized or savage nations or tribes. It aims to discover the laws of speech, to pierce into prehistoric darkness, and to trace the origin not only of states but of all human opinions. The establishment of a British empire in India (1755-65) was the foundation also of the science of glossology or comparative philology. By command of Warren Hastings, a translation of Hindoo and Mohammedan laws was edited by N. B. Halhed in 1776. By the exertions of Sir William Jones, who wrote a Persian grammar and translated the *Sakontala*, Manu's ordinances, &c., the Asiatic society was founded at Calcutta in 1784, and Sanscrit was opened to the scrutiny of the European mind. Lipsius, Salmasius, and others, had already written on analogies between various languages. Scaliger and Wilkins made comparisons between the Persian and German, and Junius between the Gothic and the Anglo-Saxon. Leibnitz had suggested sound principles of ethnography, and advised collections of comparative lists of words. G. Hickes had published a *Thesaurus Grammatico-Criticus et Archæologicus Linguarum Veterum Septentrionalium* (1715). Pater Nosters had been collated by Gesner (1655), Wilkins, Chamberlayne (1715), and Hervæus (1784). Sanscrit had been studied by Handleben, Holwell, who wrote on Indian mythology, Dow, and Wesdin (St. Bartolomeo), but without important results, as there was no method in their pursuits. The following is a list of some of the most prominent scholars, with their principal works, who have most successfully advanced comparative philology: H. T. Colebrooke, *Amara Cosha* (an Arabic dictionary); W. Carey, a Sanscrit grammar; C. Wilkins, grammar, and version of the *Hitopadesa* (Bilpay's fables); F. Schlegel, *Sprache und Weisheit der Indier*; A. W. Schlegel, *Indische Bibliothek*; Prichard, inaugural dissertation on the varieties of the human race; H. H. Wilson, Sanscrit dictionary; F. Bopp, comparative grammar; Monier Williams, English-Sanscrit dictionary; Foucher d'Osbonville, *Puranas*; Gorresio, *Ramaya*; Lassen, and Burnouf. Eminent in other branches of glossology are the Slavists Dobrowski, Schaffarik, and Linde, the brothers Grimm, and Rask, a most sagacious inquirer into the old Norse, Finnic, Zend, Sanscrit, and Romanic languages, to whom, earlier than to J. L. Grimm, the law of the transition of consonants was known. Many other names are given in the articles on the several languages.

LANGUEDOC, one of the largest and most beautiful of the old provinces of France, bounded N. by Lyonnaise, Auvergne, and Guienne, E. by the Rhône, S. by the Mediterranean, Roussillon, and the Pyrénées, and W. by Guienne and Gascony; length about 170 m., breadth about 90 m. It was divided into Haut-Languedoc, Bas-Languedoc, and the Cévennes. Out of this province have been formed the departments of Haute-Loire, Lozère, Ardèche, Gard, Hérault, Aude, Tarn, and portions of Haute-Garonne and Tarn-et-Garonne. The canal of Languedoc, which extends from the Garonne to the Mediterranean, is over 150 m. in length.

LANIERE, NICOLÒ, an Italian painter, engraver, and musician, born in 1568, died about the middle of the 17th century. He settled in London and became a favorite with Charles I., who appointed him in 1626 his chapelmaster, with a salary of £200. He composed the music and painted the scenes for a masque of Ben Jonson's performed in 1617, and is said to have written the music to Pierce's funeral hymn for Charles I. He was also a dealer in pictures, and was instrumental in procuring for Charles the gallery of the duke of Mantua, containing some of Mantegna's finest works, at an outlay of £20,000.

LANIGAN, JOHN, D.D., an Irish clergyman and author, born in Coshel in 1758, died in Finglas, near Dublin, July 7, 1828. About the age of 16 he entered the Irish college at Rome, where he took orders and received the degree of D.D. He was soon afterward appointed to the chair of Hebrew, divinity, and the Scriptures at Pavia; and when the university was deserted in 1796 in consequence of the war, he returned to Ireland and was elected to a similar position in the college of Maynooth. His election having been opposed however by the bishop of Cork, who suspected him of Gallicanism, he refused the professorship, and obtained an appointment in the record tower of Dublin castle, to which were added in 1799 the duties of librarian, editor, and translator for the Dublin society. This position he retained until 1821, when his intellect became impaired, and he passed the rest of his life in a private lunatic asylum at Finglas. He left an "Introduction concerning the Nature, Present State, and True Interests of the Church of England, and on the Means of effecting a Reconciliation of the Churches," and an "Ecclesiastical History of Ireland" (4 vols. 8vo., 1822), which has been much praised for learning and critical acumen. He also published an Irish edition of the Roman breviary, and an edition of Alban Butler's "Moral Discourses," with a preface.

LANJUNAIS, JEAN DENIS, count, a French jurist and statesman, born in Rennes, March 12, 1753, died in Paris, Jan. 13, 1827. When scarcely 22 years of age he won by public competition the professorship of ecclesiastical law in his native city. He acquired great reputation both as a lecturer and a barrister, was in 1789 elected a deputy to the states-general,

took an active part in nearly all the great measures of the constituent assembly, framed the bill for the civil constitution of the French clergy, and was the first mover of a plan, afterward adopted and embodied in the civil code, by which the registration of births, marriages, and deaths was to be transferred from ecclesiastics to municipal officers. On the adjournment of the constituent assembly he returned to Rennes, where he lectured upon constitutional law, and was soon made a counsellor in the national high court. In 1792, being sent to the convention, he resisted the extreme measures of the revolutionists, tried to have the accusation against Louis XVI. set aside, protested against the illegality of the proceedings in that prince's trial, and, being obliged to participate in it, voted for his confinement and subsequent banishment. He sided with the Girondists, was arrested on June 2, 1793, escaped to Rennes, was outlawed, and succeeded in secreting himself for 18 months in a closet in his own house. On the fall of Robespierre he claimed his seat as a deputy, but was not reinstated until 1795. He afterward became president of the assembly. On the organization of the directorial government he was elected to the council of the ancients by 73 departments. After the 18th Brumaire he was appointed a member of the senate, opposed the consulate for life and the establishment of the empire, received nevertheless the title of count from Napoleon, and was one of the members who voted for the deposition of the emperor in 1814. He was made a peer by Louis XVIII., submitted to Napoleon when he returned from Elba, presided over the chamber of deputies during the Hundred Days, and on the 2d restoration resumed his seat in the chamber of peers. Here he advocated liberal opinions, opposing the reactionary measures of the Villèle ministry and the growing influence of the clergy. He was acquainted with the oriental languages; he entered the academy of inscriptions in 1808, became afterward a member of the Asiatic society of Paris, and was elected associate of the philosophical society of Philadelphia. His works have been published in 4 vols. 8vo. (Paris, 1832).

LANNER. See FALCON.

LANNES, JEAN, duke of Montebello, a marshal of France, born in Lectoure, in the old province of Guienne, April 11, 1769, died in Vienna, May 31, 1809. He was the child of poor parents, who apprenticed him at 15 years of age to a dyer. He quitted this occupation in 1792, and enlisting in the army, soon attained the rank of *chef de brigade*. In 1795 he was included among the officers whom the report of the committee charged with reorganizing the army recommended to be dropped from the service; but disdaining an inactive life, he followed Bonaparte to Italy in 1796, with the intention of recommencing his career as a volunteer. At the outset of the campaign he attracted the notice of his general, and for his bravery at the battle of Millesimo he was promoted on the field

to the command of a demi-brigade of the line. At the passage of the Po, May 7, he was the first to reach the opposite shore; and at the succeeding engagement at Fombio, his impetuous valor contributed in a great measure to the French victory, as also at the bridge of Lodi and the assault of Pavia, subsequent to which he was made a brigadier-general. At the battle of Arcole, Nov. 14, he was wounded in two places; but learning on the following day that the combat had been renewed before the bridge of Arcole, he mounted his horse, and plunging into the thickest of the fight was struck senseless by a ball while urging on the troops. In two months he was again in the field, and participated in some of the most important achievements of the campaign of 1797 until the peace of Campo Formio. He followed Bonaparte to Egypt in 1798, and fought with distinction at Gaza, Jaffa, Kakoun, St. Jean d'Acre, and Aboukir. At the last named place he was severely wounded while storming a redoubt. Returning to France, he contributed greatly to the success of the 18th Brumaire (Nov. 9, 1799), receiving as a recompense for his services the command of the consular guard; and in the spring of 1800, as general of division, he took command of the advanced guard of the army with which Napoleon entered Italy over the St. Bernard, and he ended a series of brilliant achievements by completely beating the Austrians under Ott at Montebello, with a loss to them of 5,000 men, whence he subsequently received the title of duke of Montebello. For his conduct at Marengo, in which with his corps he sustained for 7 hours the attacks of the Austrian army supported by a powerful train of artillery, he was presented with a sword of honor, and he was selected to present to the French government the standards taken from the Austrians. In 1801 he was sent to Lisbon as minister plenipotentiary, but showed in this capacity so arbitrary and rapacious a disposition and so little of diplomatic finesse, that it was deemed necessary to recall him. In 1804 he was created a marshal of the empire, and in the succeeding year he accompanied Napoleon to the Austrian campaign in command of the left wing of the army. He was present at Wertingen, Ulm, and Braunau, and occupied Linz; and at Austerlitz, where he had two aids killed by his side, he fought with characteristic bravery and obstinacy. He was actively employed in the campaign of 1806 against the Prussians; and at the battle of Jena, where he commanded the centre, he narrowly escaped death from a musket ball which pierced his clothing. He subsequently participated in the campaign against the Russians, terminating at the battle of Friedland, June 14, 1807, where with his single corps he sustained the attack of Bennigsen's troops until the French reserves came up and assumed the offensive. The failure during this campaign of the attempt to storm the intrenched Russian camp at Heilsberg, June 10, gave occasion for a fierce altercation between Napoleon and Lannes, in which the former was boldly accused of man-

ifesting an undue partiality for his brother-in-law, Murat. In 1808 Lannes accompanied the emperor into Spain, and, having defeated Castanos and Palafox at Tudela, conducted the siege of Saragossa, which after a defence of many days, memorable alike for the heroic endurance of the inhabitants and the energy and skill of the French marshal, capitulated Feb. 21, 1809. He was almost immediately summoned to Germany, where the campaign of 1809 had already commenced, and placed in command of the 2d *corps d'armée*, numbering 50,000 men. At Eckmühl, April 22, his services mainly contributed to the successful issue of the battle, and at the assault on Ratisbon on the succeeding day he signalized himself by one of those daring acts for which he was conspicuous even among Napoleon's generals. Seeing that his men hesitated to enter the breach under a heavy fire from the ramparts, he seized a scaling ladder and led them in through a storm of shot, thereby carrying the place in a few minutes. The sanguinary battles of Aspern and Essling, May 21 and 22, witnessed the termination of his career. On the 21st he held the village of Essling against repeated attacks of the Austrians, until both armies, wearied by the labors and toils of the day, slept upon their arms. On the succeeding day he headed an immense column of infantry, artillery, and cavalry, which Napoleon hurled on the Austrian centre, and which, but for the obstinate resistance of the duke of Reuss's reserve grenadiers thrown into squares, would have cut the Austrian army in two. Lannes was forced back toward the bridge connecting the left bank of the Danube with the island of Lobau, whither the French were soon in full retreat; but here, in command of the rear guard, he effectually checked the advance of the fresh troops whom the archduke Charles was constantly bringing up. To animate his men in this desperate struggle with a victorious enemy, he dismounted from his horse, and stationed himself in the front ranks. At that moment he was struck by a cannon ball, which carried away the whole of his right leg, and the foot and ankle of his left. As he was borne from the field by his grenadiers, he encountered the emperor, who, kneeling by his litter, embraced him with tears, and showed an unusual degree of emotion. Amputation was resorted to with no perceptible relief, and Lannes, after lingering for 9 days in great agony, expired in Vienna, whither he had been removed soon after the battle of Essling. "Lannes," said Napoleon at St. Helena, "when I first took him by the hand, was a mere ignoramus. His education had been much neglected, but he made great progress, and would in time doubtless have become a general of the first class. He was a man of extraordinary bravery. Calm in the midst of danger, he possessed a clear and penetrating observation, and was quick to profit by every occasion which presented itself. Violent and ungovernable in his expressions, sometimes even in my presence, he was nevertheless greatly

attached to me. In his paroxysms of anger he would permit no one to speak to him, and it was not always prudent to attempt it while he was in these moods. He had also the habit of coming to me and complaining that we could put no reliance on such and such a person. As a general he was far below Moreau or Soult." On another occasion he said of him: "With Lannes, courage at first predominated over judgment; but the latter quality daily gained strength, and was rapidly establishing an equilibrium. He had already become a great general at the time of his death. I found him a dwarf and I lost him a giant." A statue of him was erected in his native place after the revolution of July, 1830. His son, the present duke of Montebello, was a minister under Louis Philippe, and is a proprietor of vineyards in Champagne.

LANSDOWNE, WILLIAM PETTY, 1st marquis of, better known as the earl of Shelburne, a British statesman, born May 2, 1737, died May 2, 1805. In early life he entered the army, and served with distinction under Prince Ferdinand in the 7 years' war. Upon the death of his father in April, 1761, he took his seat in the house of peers, where he manifested so much ability for the discharge of public duties, that upon the formation of the Grenville ministry in April, 1763, he was appointed president of the board of trade, with a seat in the cabinet, although he was not then 26 years of age. In this capacity he distinguished himself by a conciliatory policy toward America, and by his opposition to the plans proposed for taxing the colonies, thereby incurring the hostility of the king and of his colleagues. Upon the remodeling of the cabinet in September he resigned office, and thenceforth attached himself to the policy and fortunes of Mr. Pitt, who, upon assuming the reins of government in 1766, made him secretary of state for the southern department, which included the colonies. He here renewed his endeavors to remove all causes of complaint between the colonies and the mother country, but was constantly thwarted by Townshend, the duke of Grafton, and others of his colleagues, who during the illness of Pitt, now become earl of Chatham, had acquired a predominating influence in the cabinet. Not choosing to resign until he could advise with Chatham, he was dismissed by the king in Oct. 1768; and thenceforth, during the Grafton and North administrations, he proved himself one of the ablest and most active opponents of the ministry in the upper house. Upon the resignation of Lord North in March, 1782, he took office under the marquis of Rockingham; and upon the death of the latter in July of that year he was intrusted by the king, who had begun to put much confidence in him, with the formation of a new ministry. The new premier had to encounter the opposition of the Fox party, who were disappointed that the duke of Portland had not received office; and the coalition between these and the adherents of Lord North compelled him to resign in Feb. 1783. But

during the 7 months that he held office the defence of Gibraltar and the victories of Hood and Rodney added lustre to the British arms; and the preliminaries for peace with America and for the acknowledgment of the independence of the United States were concluded, notwithstanding he had joined Lord Chatham in expressing the "strongest disapprobation" of the latter measure. From this period he retired almost wholly from public life. In 1784 he was created marquis of Lansdowne. Lord Shelburne was considered one of the most liberal and accomplished statesmen of his time, and probably carried out more fully than any of his contemporaries the principles inculcated by the elder Pitt.—HENRY PETTY FITZMAURICE, 8d marquis of, 2d son of the preceding, born July 2, 1780. He was educated at Westminster school; subsequently spent some years in Edinburgh under the instruction of Dugald Stewart, where he imbibed liberal principles from frequent intercourse with Brougham, Jeffrey, Sydney Smith, and others; and was graduated at Trinity college, Cambridge, in 1801. Upon coming of age he entered parliament for the borough of Calne, succeeded to the representation of Cambridge university on the death of Mr. Pitt, and upon the formation of the "all the talents" ministry under Grenville and Fox in Feb. 1806, was appointed chancellor of the exchequer, being within a few weeks of the age at which his father had first accepted office 48 years previous. Lord Henry Petty, as he was called, identified himself from the outset of his career with the support of the leading measures of the liberal party, but was precluded by the short duration of the ministry in which he held office from fully displaying his financial abilities. He retired with his colleagues in 1807; and succeeding to his title two years later, on the demise of his brother, he became one of the whig leaders in the house of peers, a position which his amenity of manners, grasp of information, and ready powers of debate well qualified him to fill. During the long interval in which the whigs remained out of office he was an earnest and active advocate of Catholic emancipation and the abolition of slavery, and was one of the first to urge the necessity of parliamentary reform and free trade. After 20 years' exclusion from a participation in the administration of public affairs, he was appointed, in Aug. 1827, home secretary in the short-lived cabinet of Viscount Goderich. Upon the formation of Earl Grey's ministry in Nov. 1830, he received the appointment of president of the council, an office which he held uninterruptedly, with the exception of a few months, until Sept. 1841, when he retired with his colleagues of the Melbourne ministry. He accepted the same office again under Lord John Russell's administration in July, 1846, and held it until Feb. 1852. Upon the formation of the Aberdeen cabinet in the succeeding December he was solicited to return to his former post, but declined, whereupon he was offered a seat in the cabinet without office,

which he occupied until March, 1858, when he retired definitively from public life. Since the death of Lord Holland he has been regarded as the Nestor of the upper house, having been a hereditary legislator for more than 50 years, and a minister of the crown for nearly 25.

LANSING, a city of Ingham co., Mich., and capital of the state, situated on Grand river, 110 m. N. W. from Detroit; pop. in 1859 about 5,000. It is surrounded by a fertile country abounding in timber and coal, and will be connected with the Detroit and Milwaukee railroad at Owasso by the Amboy, Lansing, and Traverse bay railroad. The river supplies it with valuable water power, and it has an active and increasing trade. The state house, a large and handsome building, occupies an eminence 50 feet above the river. The city contains a house of correction for juvenile offenders, and is the seat of an agricultural college with a farm of 700 acres, and a female college. In 1859 it had 10 churches (2 Baptist, 1 Episcopal, 1 Lutheran, 2 Methodist, 1 Presbyterian, 1 Roman Catholic, 1 United Brethren, and 1 Universalist), 1 bank, 2 weekly newspaper offices, 2 breweries, 5 carriage factories, 2 grist mills, 2 tanneries, 5 hotels, 2 planing mills, and 8 saw mills. Lansing was made the seat of government in 1847, when its settlement was barely begun, and was incorporated as a city in 1859.

LANSINGBURG, a township of Rensselaer co., N. Y., on the E. bank of the Hudson river, opposite Waterford, with which it is connected by a bridge, and 3 m. above Troy; pop. in 1855, 5,700. It contains a village of the same name (pop. in 1855 about 4,000), which is a station on the Troy and Boston and western Vermont railroad, and is accessible by sloops on the Hudson by means of a lock at Troy. The village has manufactories of brushes, oil cloths, cordage, malt liquors, &c., and contains 6 churches, 2 newspaper offices, an academy, and a female seminary.

LANTERN (Lat. *laterna*, or *lanterna*), a lamp with a transparent covering to protect the flame from the wind, designed either to be carried in the hand or suspended or otherwise fixed in an open place, as for lighting a street or a passage in a building. Lamps of this description are frequently referred to by ancient authors; but it appears that those used by the Greeks and Romans were more commonly of the portable form than designed for stationary purposes. The Egyptians of the present day make great use of cylindrical-shaped lanterns of transparent cloth or paper, which can be drawn out when used and at other times pressed down flat like the circular bellows, and having in the centre of the disk which forms the bottom a socket for holding a candle; the upper end is left open for the escape of the smoke. Wilkinson refers to some ancient sculptures in which there appears to be a representation of such a lantern carried by a guard. In the ruins of Herculaneum and Pompeii two cylindrical bronze lanterns have been discovered, which were skilfully and elaborately

constructed. The bottom of one of them was supported upon metallic balls, and attached to this within was a bronze lamp provided with an extinguisher; two upright pillars supported the frame, and from these and the centre of the hemispherical cover proceeded chains to the ornamental handle by which the instrument was carried; the sides were of translucent horn; the cover could be partially raised for ventilation as well as to serve for a door. According to Plautus, horn lanterns were brought from Carthage. Bladder also was used instead of horn. Dark lanterns covered on three, or if necessary on all sides, were used in military operations for facilitating night marches. From the use of portable lanterns and flambeaux, often referred to by Latin authors, it would appear that the streets of ancient Rome were not lighted, or at best but very imperfectly so, at night. Beckmann, however, finds some authority for believing that lanterns were used in the most frequented parts both of Rome and Antioch. According to the same author, the streets of Paris, being much infested with robbers and incendiaries, were lighted by order of the government in 1558 with *falots*, or vases filled with pitch, rosin, or some such material, which were kept burning at the corners of the streets. Lanterns like those in modern use were soon substituted for these. But the plan being very inefficiently conducted, the abbé Landati in 1662 obtained an exclusive privilege of letting out portable lanterns from booths or posts placed in different parts of Paris and other cities of France. Foot passengers calling for a man with a lantern paid 3 sous for every quarter of an hour, and each coach using a lantern paid 5 sous; each lantern was provided with a regular hour glass to prevent disputes as to the time. This system, however, continued only to 1667. Lanterns were used to some extent in London as early as 1417, as appears from an order of Sir Henry Barton, mayor, recorded in Stow's "Survey of London," that "lanthorns with lights bee hanged out on the winter evenings betwixt Hallowtide and Candlemasse." During the 16th, 17th, and 18th centuries various European cities adopted the practice of lighting the streets by fixed lanterns, but until the introduction of gas the illumination was very feeble.—The Chinese have a festival called the feast of lanterns, in which they make an extraordinary display of the greatest variety of lanterns. Some of them are described as of enormous size, sometimes 25 or 30 feet in diameter, elaborately gilded and ornamented, and costing vast sums of money. Each of these is lighted up with a great number of torches, and they are used as rooms for the exhibition of various diversions. The smaller ones, covered with transparent silk ornamented with brilliantly colored pictures, are said, when lighted up, to produce a most beautiful and striking effect. The ancient Egyptians also celebrated a festival called that of the burning lamps, during which lamps were kept burning in the open air; but it does

not appear that these were of the form of lanterns.—In architecture, a lantern is a sort of drum or cage with glass sides, erected upon a roof or surmounting a dome for admitting light below. The glass in the vertical sides is better protected from injury by hail than in the ordinary sky lights.

**LANTHANUM**, or **LANTANUM** (Gr. *λανθάνω*, to lie hid), a metal discovered in 1841 by Mosander, who then separated it from the metal didymium, with which it was associated together with cerium in the mineral cerite; symbol, La; chemical equivalent, 47. It is a dark lead-gray powder, soft to the touch, and the particles cohering together. Its oxide, LaO, is a white powder, which dissolves readily in acids, and forms salts which are perfectly colorless when free from didymium.

**LANUVIUM** (now *Civita Lavinia*), an ancient city of Italy, in Latium, 18 m. S. S. E. from Rome. It was founded at a very remote period, and probably by a colony from Alba. It took part in the wars of the Latins against the Romans. Subsequently it was celebrated for its temple of Juno Sospita. Here the emperor Antoninus Pius was born. Few remains of the old city now exist.

**LANZI**, **LUIGI**, an Italian writer on art, and archaeologist, born in Monte dell' Almo, near Fermo, in the Papal States, June 14, 1732, died in Florence, March 30, 1810. He was carefully educated at home, particularly in classical literature, and at the age of 18 entered the society of the Jesuits, at whose college in Fermo he completed his studies. He was subsequently employed there as a teacher, and, at the suppression of the order by Clement XIV. in 1773, had acquired a considerable reputation for elegant scholarship. Choosing literature as a profession, he published a description of the Florentine gallery, of one department of which the grand duke Leopold had appointed him keeper. His *Saggio di lingua Etrusca*, a work of profound research, and which placed him at the head of modern Italian archaeologists, was an ingenious attempt to assign a Greek origin to the religion and mythology of Etruria. These works, however, are but little known in comparison with his *Storia pittorica*, which he undertook at the suggestion of his friend Tiraboschi, the historian of Italian literature. No general history of Italian painting had previously appeared, and the histories of particular schools, although numerous and full, were too strongly marked by bias and prejudice to be of any general value. Lanzi's work was the first comprehensive treatise in which the history of each school is given according to its several epochs, and the first written in a philosophical and impartial spirit. The first part was published in 1792, and such was the favor with which the whole work was received that several editions were published in the author's lifetime, each of which received numerous additions and revisions from his hand. It has been translated into various languages, and is familiar to English readers through the

excellent version of Thomas Roscoe, which forms 8 vols. of Bohn's "Standard Library." Lanzi also published a collection of dissertations on Etruscan vases; a book of Latin poems written by himself; a translation of Hesiod's "Works and Days" in *terza rima*; and *Opere sacre*, a series of treatises on spiritual subjects, to which he is said to have attached more importance than to any of his other writings. He died of apoplexy, and was buried in the church of Santa Croce in Florence by the side of Michel Angelo.

**LAOCOÖN**, a Trojan hero, generally represented as the son of Antenor, and a priest of Apollo or Neptune. While the Trojans were assembled round the wooden horse of the Greeks, deliberating whether they would admit it into their city, Laocoön rushed forward, warned them not to receive it, and struck his spear into its side. As a punishment for his impiety toward an object consecrated to Minerva, two monstrous serpents attacked him and his two sons while preparing to sacrifice in the temple of Neptune, and, coiling themselves round the bodies of the three, crushed them to death. This legend was a favorite subject with the poets and artists of ancient Greece. The story is related by Virgil, and a celebrated group of sculpture representing Laocoön and his sons encoiled by the serpents, and suffering the agonies of strangulation, is still extant, and is stated by Pliny, who regards it as "superior to all other works of painting or sculpture," to have been the work of the Rhodian statuary, Agesander, Polydorus, and Athenodorus. It was discovered at Rome in 1506, and purchased by Pope Julius II., who placed it in the Vatican, where it still remains. Winckelmann contends for an early Grecian origin of this masterpiece; but Lessing, in his admirable work on art, to which he gave the title of *Laocoön*, believes the sculptors to have lived in the latter part of the 2d century.

**LAODAMIA**, a mythical Grecian princess, daughter of Acastus and wife of Proteus, a Thessalian hero, who, having led his warriors against Troy, was the first Greek slain on the Asian shore. His disconsolate spouse entreated the gods to permit her to hold converse with her husband for only three hours. The request was granted, and Mercury conducted Proteus back to the upper world; but when he was forced to return, Laodamia, unable to endure separation from him, expired.

**LAODICEA**, in ancient geography, the name of 6 Greek cities in Asia, situated in Phrygia, Syria, Lycania, Colesyria, Media, and Mesopotamia, founded by Seleucus Nicator, the first king of Syria, and some of his successors. Two deserve particular notice. I. **LAODICEA ON THE LYCUS**, a tributary of the Meander, in a S. W. corner of Phrygia, which, however, was claimed by some earlier writers as part of Lydia and Caria. It received its name from Laodice, the queen of Antiochus Theos, its founder, belonged for some time to the kingdom of Pergamus, and under the Romans, though frequently visited

by destructive earthquakes, became one of the most flourishing and opulent cities of Asia Minor. Its luxury in the early times of Christianity is attested by the severe rebuke addressed to its inhabitants in the Apocalypse. The town of Eski-Hissar was built by the Turks on its site.

**II. LAODICEA ON THE SEA COAST**, a maritime city of Syria, near Antioch, as the port of which it may be regarded, founded by Seleucus Nicator, and named after his mother. It was renowned for the fertility of its wine-growing environs, its splendor, and the excellence of its harbor. In the later period of the Syrian empire it became almost independent, and it suffered greatly during the civil war after the death of Cæsar, when it stood a siege against the Cassians. It was rewarded by Antony with exemption from taxes, and adorned by Herod the Great with an aqueduct, the ruins of which, with some other remnants of its ancient greatness, are still to be seen. During the middle ages it suffered greatly from the attacks of the Moslems, whom it withstood down to 1188. Its site is now occupied by the Turkish city of Latakia (Latakeas or Ladakieh), in the pashalic of Tripoli, built on a peninsula which projects some 2 m. into the Mediterranean, opposite the N. E. extremity of Cyprus; pop. estimated at from 5,000 to 10,000. It is surrounded by groves of myrtle, pomegranate, mulberry, and olive trees, and consists of two portions, the upper and lower town. The former occupies an elevated site at a short distance from the sea; the latter, called La Scala, extends along the shore in the vicinity of the harbor. Latakia and Alexandrette are the ports of Aleppo, and a great part of the important trade of that city with the adjoining provinces passes through the former place, the Aleppo imports of manufactured goods amounting to nearly \$6,000,000 annually. The principal articles of export are cotton, gall nuts, sesame seed, wool, wax, camels' hair, and several minor products. Grain can be exported only in times of scarcity in Europe, when the prices compensate for the heavy expenses of transportation, and then chiefly to Marseilles. Within the last few years a portion of the Aleppo wool shipped from Latakia has found its way to the United States. The principal article of trade, however, is tobacco, of which large quantities are raised in the neighborhood, and which is famous all over the world.

**LAON**, a city of France, capital of the department of Aisne, situated on an isolated hill 74 m. N. E. from Paris; pop. in 1856, 8,199. It is surrounded by walls and ramparts which are about 4 m. in circumference. Under the early French kings it was a place of considerable importance, and it is the see of a bishop. It was taken by the duke of Burgundy in 1411, by the English in 1419, by the French again in 1429, and by Henry IV. in 1594. The allies defeated Napoleon here, March 8-10, 1814, in a series of engagements which, though hardly deserving the name of battles, had the most important consequences.

**LAOS**, a country of Asia, in Indo-China or Further India, bounded N. by China, E. and S. E. by Anam, S. W. by Siam, and N. W. by Burmah, extending from about lat. 16° to 24° N., though its limits are not closely defined; pop. estimated at 1,400,000. It is traversed by the Mekong or Cambodia river, and is separated from Burmah by the Saluen, both which are streams of considerable magnitude. The surface appears to be a valley lying between two nearly parallel ranges which run along the N. E. and S. W. frontiers. The soil is fertile, and produces rice, tobacco, the sugar cane, indigo, benzoin, guma, teak, sapan and sandal woods, betel, and numerous fruits. Elephants and draught cattle are the principal animals, and valuable mines of tin and iron are said to exist, while gold is washed from the sands of the rivers, and copper, lead, emeralds, and rubies are also found. The Laonese are an honest but indolent race, much addicted to the study of magic, and resembling in religion, customs, and language the Burmese. They are skilful workers in metal, and make mats, paper (from bark), leather, pottery, silk and woollen fabrics, sugar, and gunpowder. They have a trade with the British settlements in Indo-China, and with Tonquin. A large part of their territory is in the possession of the Siamese.

**LA PAZ**, a department of Bolivia, bounded N. and E. by that of Beni, S. by Cochabamba and Oruro, and W. by Peru; area, 86,418 sq. m.; pop. in 1855, 846,000. It extends over the N. half of the Bolivian portions of the valley of the Desaguadero, and comprises those valleys of the Cordilleras through which the head streams of the Beni (a principal affluent of the Amazon) flow. It is not much cultivated, although the lower parts of the valleys are very fertile.—**LA PAZ DE AYACUCHO**, capital of this department, is about 200 m. from Ohuquisaca, in lat. 17° 30' N., long. 68° 25' W., and situated on the E. declivity of the Andes at an elevation of 12,000 feet above the sea, on both sides of the deep ravine of Quebrada de Choquehapu, crossed here by 9 bridges; pop. in 1855, 42,850. It contains a handsome public square, but the streets are generally irregular and steep. The cathedral is a noble edifice, and there are some 15 other churches. It is the seat of a bishop and a university. It is the principal commercial emporium of Bolivia, the exports consisting of gold, bark, and other products of the country, and the imports of manufactured goods, the bulk of which comes through Peru. It was founded in 1548. Its original name of Nuestra Señora de la Paz was changed in 1825 to its present name in honor of the national victory of Ayacucho.

**LA PAZ**, a town and mission on a bay of the same name, on the E. shore of Lower California; pop. about 500. Some of the houses are of large dimensions, and possess much architectural beauty, showing that there was formerly luxury and wealth, which are no longer seen. Its wealth was chiefly derived from its pearl-oyster fisheries.

**LAPEER**, a S. E. co. of Mich., drained by the sources of Flint and Belle rivers; area, 828 sq. m.; pop. in 1850, 7,029. It has a rolling surface and a rich soil, and is well wooded. The productions in 1850 were 66,967 bushels of Indian corn, 84,521 of wheat, 52,956 of oats, 88,798 lbs. of wool, and 6,875 tons of hay. There were 7 grist mills, 11 saw mills, 1 newspaper office, 7 churches, and 2,815 pupils attending public schools. The Port Huron and Milwaukee railroad when completed will pass through Lapeer, the capital.

**LA PÉROUSE**, JEAN FRANÇOIS DE GALLAUP, count of, a French navigator, born at Guo, near Albi, Languedoc, Aug. 22, 1741, perished probably by shipwreck at Vanikoro, an island in the South Pacific, in 1788 or 1789. He entered the navy at the age of 15, and in 1759 was present under Conflans in the engagement with Sir Edward Hawke off Belle Isle, in which he was severely wounded and taken prisoner. Subsequently he served with credit in the American war of independence, and in 1782 entered Hudson's bay with a small fleet and destroyed the British trading establishments there. Upon the conclusion of the war Louis XVI., with a view of securing for the French people a share in the glory which the English were reaping from the discoveries of navigators like Cook, caused the frigates *Astrolabe* and *Boussole* to be fitted out under the command of La Pérouse for maritime explorations in the Pacific, and along the coasts of America, China, Japan, and Tartary. La Pérouse, sailing from Brest, Aug. 1, 1785, arrived in Concepcion, Chili, in the succeeding February. Thence, by way of Easter island and the Sandwich islands, he proceeded to the N. W. coast of America, making no discovery of importance on the voyage. From Mount St. Elias he explored the coast as far as Monterey, California, whence he crossed over to Asia. During the summer of 1787 he followed the coast from Manila to Petropavlovsk, at which place he arrived in September, having in the interval carefully examined the waters which separate the coast of Tartary from the Japanese group of islands, and discovered the straits between the islands of Saghalien and Yesso which bear his name. From Petropavlovsk he sent to France copies of his journals and charts and other data, from which an account of his voyage was subsequently prepared. Sailing S. in the latter part of September, he touched at Maouna, one of the Navigator's islands, where De Langle, the commander of the *Astrolabe*, and a number of men were treacherously killed by the natives, and thence proceeded to Botany Bay. A letter from La Pérouse to the French minister of marine, dated Botany Bay, Feb. 7, 1788, announcing his intention of proceeding to the isle of France by the way of Van Diemen's Land, the Friendly isles, and New Guinea, was the last intelligence ever received from the expedition. In 1791, at the recommendation of the society of natural history, a squadron was despatched under Admiral Entrecasteaux in search of La Pérouse,

but failed of finding any trace of him. Having learned while at Hobarton in 1828 that fragments of a shipwrecked vessel and her equipments had been discovered in Vanikoro in the New Hebrides group, Dumont d'Urville sailed thither with his vessel the *Astrolabe*, and ascertained that many years previous two ships had foundered on a reef off the W. coast of the island, and that such of the crew as had not been drowned or murdered by the savages had sailed from the island in a small vessel built by themselves, and never afterward been heard of. Deeming the evidence satisfactory that these were the ships of La Pérouse, he caused a cenotaph to be erected near the locality of the shipwreck.

**LAPHAM**, INCREASE A., an American naturalist, born in Palmyra, Ontario (now Wayne) co., N. Y., March 7, 1811. He began life as a civil engineer, and from 1825 until 1827 was engaged a part of the time on the Welland canal in Canada, and a part on the Miami canal in Ohio. In Dec. 1827, he went to Louisville, Ky., and attended school, but at the same time continued to act as an engineer, being employed for nearly two years on the canal around the falls of Ohio at Louisville. Here he had opportunities to pursue his studies and to make observations on the climate, geology, botany, &c., of the country; and in 1827 he wrote his first scientific essay, being a "Notice of the Louisville Canal, and of the Geology of the Vicinity, with Plans, a Map, and Geological Section," which was published in Silliman's "American Journal of Science" of that year. From 1830 to 1832 he was employed on the Ohio canal, and in 1833-'5 acted as secretary of the Ohio board of canal commissioners at Columbus. This office afforded him considerable leisure, which was devoted to scientific pursuits. He began here the collection of his herbarium, now numbering about 8,000 species, and was one of a committee of scientific men appointed by the legislature of Ohio to report on the subject of a geological survey of that state. His duties under that appointment were terminated by his removal in 1836 to the newly founded city of Milwaukee, where he has since resided, and has held several municipal and other offices. In 1844 he published "Wisconsin: its Geography and Topography, History, Geology, and Mineralogy," and in 1855 a geological map of Wisconsin, compiled in great measure from personal observations. In the same year appeared his "Antiquities of Wisconsin," in the 7th volume of the Smithsonian "Contributions to Knowledge," the result of investigations undertaken in behalf of the American antiquarian society. He has contributed numerous papers to the scientific periodicals of the United States, and was the first to ascertain from careful observations that there is a slight lunar tide on Lake Michigan.

**LAPIDARY** (Lat. *lapidarius*, a stone cutter, from *lapis*, a stone), a workman whose trade is the cutting and polishing of small ornamental stones. As already noticed in the article **GEMS**,

there were lapidaries in very ancient times skilled in fashioning hard stones into seals, and engraving them with devices. To that article and to DIAMOND reference may be made for an account of some of the operations of this class. The apparatus employed by the lapidary consists almost exclusively of wheels or disks for grinding down, slitting, and polishing the faces of minerals. These are of a few inches diameter, made of lead, pewter, brass, or iron, and of various soft alloys, and some used for smoothing the softest minerals are of willow or mahogany. The metal wheels are called laps. The term mill is applied to them all, and some are distinguished as slitting mills, others as roughing, smoothing, or polishing mills, of all which there are varieties adapted to the different degrees of hardness of the minerals. The polishing mill for the softest stones is formed of a coil of list, wound with the edges outward; it is also sometimes made of bristles like a brush, and again of wood covered with buff leather. For slitting purposes an iron disk is employed of 8 or 9 inches diameter and  $\frac{3}{4}$  of an inch in thickness. The various disks used by the lapidary are adjusted to a vertical spindle, and one of them is set in the table or lapidary's bench, so as to revolve horizontally just above the surface. Its axis extends beneath the table, and is there connected with a driving wheel attached to another vertical axis, which also passes through the table and terminates above in a winch or crank. This is turned with the left hand while the stone is guided upon the mill with the right. The mills are fed with moistened diamond powder or emery and water; and as the hard powder imbeds itself in the soft metal, this becomes merely the medium for holding the abrading material, and the softer substance apparently grinds and cuts the harder objects that are applied to it. A raised edge around the table prevents the dispersion of the diamond powder or emery. Close to the mill is a crank of round iron set in the table, which can be turned nearer to or further from the disk. This is for supporting the arm of the workman in holding the stone to the wheel; or, when its upright extremity is capped with a wooden socket, which is perforated with a number of holes, it serves to retain at any desired angle a stick upon the end of which is cemented the stone to be ground in facets. By this contrivance the exact inclination required is given to the faces of ornamental stones. Diamond powder is prepared for the mills by grinding the waste particles in steel-mortars till they lose their sparkling appearance. It is applied mixed with olive oil, or better with the oil of brick, a thin limpid oil not liable to thicken by exposure to the air. The slitting mill is charged with it around the extreme edge, and it is carefully renewed as required. It is more economical for this use, and applied to the surfaces of other mills for grinding the facets of hard stones, than emery; but the latter powder with water is employed for the more common class of stones. It is used of

various degrees of fineness, and in such quantity that there shall always be a loose portion of it between the stone and the metallic surface of the lap. Polishing is effected by successively using finer and finer powders. The hardest small stones are finished on laps of copper or of pewter, and others on lead, and the powder used is rotten stone, which is plentifully applied with water. To make it adhere, the face of the metal is hacked in lines with the edge of a knife. For very soft stones, as alabaster, after these are smoothed upon a lead or wood mill with flour emery, the list mill is employed with pumice stone and water, and after this the buff leather disk with fine putty powder and water. The last polish is sometimes given with the hand and putty powder. An apparatus for amateurs is described by Mr. Mawe, which may be used in private houses, and is sufficient for slicing and polishing the several varieties of small stones, shells, &c. It consists of a lead mill for grinding to be used with emery and water; a pewter mill with rotten stone moistened with water; a tin plate for a slitting mill to be used with diamond powder; and wood mills covered with leather for polishing bits of marble and soft minerals and shells.—In the East Indies, wheels and rubbers are made of corundum or emery imbedded in lac resin. For the former about  $\frac{1}{4}$  of the bulk is lac resin and  $\frac{3}{4}$  is the powder. This is carefully stirred, a little at a time, into the melted resin; the mass is then kneaded and rolled upon a stone slab upon which fine corundum powder is sprinkled, and finally it is flattened into a disk with an iron rolling pin. The wheels are made of different degrees of fineness, and when used are set upon a horizontal axis, which the workman, sitting on the ground, causes to revolve with a spring bow, holding the stone in his left hand against the wheel, which is occasionally moistened and sprinkled with corundum powder. The rubbers contain a much smaller proportion of corundum; and the finest have intermixed the grindings of agates, carnelians, &c. Grindstones are used for giving shape to gems only in the works at Oberstein on the Nahe in Germany, where agates are fashioned into the form of various articles, as buttons, clasps, stamps, paper weights, mortars for chemical purposes, &c. Stones of large size are run by water power, and the workmen lie down in front of them when at work, the body being supported by a sort of stool. They acquire wonderful dexterity in giving the shape they desire to the hard stones, and produce with extraordinary rapidity playing marbles of perfectly globular form.—For full details of the processes of the lapidary, the 3d vol. of Holtzapffel's "Mechanical Manipulations" may be consulted; and information on the subject may also be obtained from the recent work of Dr. Feuchtwanger of New York, entitled "A Popular Treatise on Gems."

LAPIS LAZULI, LAZULITE, ULTRAMARINE, or BLUE SPAR, a mineral distinguished for its beautiful azure-blue color, highly esteemed as an

der Napoleon he was made vice-president and chancellor of the senate, a count of the empire, an officer of the legion of honor, and was the recipient of many other distinctions. He nevertheless turned against his benefactor when misfortunes overtook the latter, voted for his deposition in 1814, and was rewarded by Louis XVIII. with the title of marquis. He also suppressed in the 2d edition of his *Théorie des probabilités* (Paris, 1814) the dedication to "Napoleon the Great," contained in the edition of 1812, in which, as in the dedication to the 8d vol. of the *Mécanique céleste*, of which he did not live to publish a 3d edition, he had expressed himself under lasting obligations to Napoleon for numerous benefits. During the Hundred Days he refrained from presenting himself at the Tuilleries, and after the second restoration of the Bourbons his employments were chiefly of a scientific character, the most important being the presidency of the commission for reorganizing the polytechnic school, and that of the academy of sciences.—As a physicist Laplace occupies a position second to that of no mathematical philosopher since Newton, and to his labors the science of astronomy owes the discovery of the invariability of the major axes of the planetary orbits, and of the great inequality of the motions of Jupiter and Saturn, the settlement of the problem of the acceleration of the mean motion of the moon, the theory of Jupiter's satellites, and other important laws. In his knowledge of physical principles he was probably superior to any contemporary analyst; and his invention, in conjunction with Lavoisier, of the calorimeter for measuring the capacities of bodies for heat, his discovery of the cause of the discrepancy between the theoretical and observed velocity of sound, his rules for barometrical measurement, and his theories regarding capillary attraction, tides, and atmospheric refraction, show that in some of the most important branches of general physics his mind was not less actively and profitably employed than in mathematical analysis. The crowning glory of his scientific career was his *Mécanique céleste*, a book which has been truly said to have had no predecessor, and which must wait for a second Laplace to arise ere it finds a rival. In it he sought to digest on a uniform scientific basis the abundant materials relating to the application of analysis to physical astronomy, which had been accumulating during nearly a century, and which, written in various languages, with differing notations and in various stages of scientific progress, presented a mass of matter not only difficult of access, but almost incomprehensible to any but the most recondite student. The result of his labors appeared in 16 books, published in 5 vols. 4to., with 4 supplements, between 1799 and 1825, and arranged as follows:—vol. i.: book i., "On the General Laws of the Equilibrium of Motion;" book ii., "On the Law of Universal Gravitation and the Motion of the Centres of Gravity of the Heavenly Bodies;"—vol. ii.: book iii., "On the

Figure of the Heavenly Bodies;" book iv., "On the Oscillations of the Sea and the Atmosphere;" book v., "On the Motions of the Heavenly Bodies around their Proper Centres of Gravity" (Paris, 1799; republished in 1829-'30);—vol. iii.: book vi., "On the Theory of the Planetary Motions;" book vii., "On the Theory of the Moon," and supplement i., "On the two great Inequalities of Jupiter and Saturn" (Paris, 1804);—vol. iv.: book viii., "On the Theory of the Satellites of Jupiter, Saturn, and Uranus;" book ix., "On the Theory of Comets;" book x., "On Different Points relative to the System of the World," and supplements ii. and iii., comprising the "Theory of Capillary Action" (Paris, 1805);—vol. v.: book xi., "On the Figure and Rotation of the Earth;" book xii., "On the Attraction and Repulsion of Spheres, and the Laws of the Equilibrium and Motion of Elastic Fluids;" book xiii., "On the Oscillation of the Fluids which cover the Planets;" book xiv., "On the Motions of the Heavenly Bodies around their Centres of Gravity;" book xv., "On the Motions of the Planets and Comets;" book xvi., "On the Motions of the Satellites," and supplement iv., "On the Development in Series of the Radical which expresses the Mutual Distance of two Planets" (Paris, 1822-'5). "Within this immense programme," says Professor Nicol, "placed as if parenthetically, one finds the most striking notices on almost every important problem of mechanical physics, any one of which would have made the fortune of an ordinary mathematician." In consequence, however, of his almost total neglect to refer to the labors of his predecessors or contemporaries in this, and indeed in all his works, it is difficult for the student to know how much of it belongs to Laplace and how much to others; and he has therefore, not without apparent reason, been sometimes considered more of a compiler than a discoverer. The name of Lagrange, his great contemporary and friend, is rarely mentioned, and one of the latter's finest analytic discoveries is on one occasion cursorily referred to as "the formula No. 21 of the 2d book of the *Mécanique céleste*." In like manner the claims of Taylor and Maclaurin to the theorems passing under their names are ignored, while his references to himself are innumerable. With all needful restorations and acknowledgments, however, almost any one of the original researches of Laplace contained in the *Mécanique céleste* is sufficient to stamp him as one of the greatest of mathematicians. The only translation of this work is that by Dr. Bowditch of Boston, with full commentaries. (See BOWDITCH, NATHANIEL.) Mrs. Somerville's "Mechanism of the Heavens" is a summary of a portion of the work. Laplace's remaining works consist of his *Théorie analytique des probabilités*, the most mathematically profound treatise on the subject which has yet appeared, and containing his celebrated method for the approximation to the values of definite integrals (Paris, 1812; 8d ed. 1820, with 4 supplements);

his *Exposition du système du monde* (2 vols. 8vo., Paris, 1796; 6th ed., containing a eulogium on the author by Baroche Fourier, 4to., 1835), "a résumé of all modern astronomy, unsurpassed for perspicuity and elegance in any scientific literature," translated by Prof. Pond; and over 40 important memoirs, principally on astronomical subjects, published between 1772 and 1828. Of the 8 works above named, an edition in 7 vols. 4to. (Paris, 1843-'7) was published under government auspices. He died after a short illness, saying to a friend in his last moments: "What we know is of small amount; what we do not know is enormous." He has been accused of holding materialistic views; but his writings give no evidence of a tendency in that direction, and the subject is one which he is known to have avoided. As a scientific writer he was singularly perspicuous and elegant, and his *Système du monde*, as a specimen of style, is called by Arago "one of the most perfect monuments of the French language."

**LAPLAND** (Lap. *Sameanda*; Swed. *Lappmark*; Rus. *Lapländiya*), a territory forming the northernmost portion of Europe, bounded N. by the Arctic ocean, E. by the White sea, S. by parts of Finland, Sweden, and Norway, and W. by the Atlantic; lying between lat. 64° and 72° N., and long. 14° and 42° E.; area, about 150,000 sq. m.,  $\frac{2}{3}$  of which belongs to Russia and the rest to Sweden and Norway; pop. estimated at 160,000, including Finmark. The N. and W. coasts are exceedingly irregular, indented with numerous bays, and faced with small islands. The shores of the White sea are more even, but the gulf of Kandalaska runs from it far into the S. E. part of the Laplandish territory. There are many lakes, of which the Enareä and Imandra, both in Russian Lapland, are the most notable. The lakes are connected with the sea by streams which, inconsiderable in autumn and winter, become large rivers in the spring. The most important water courses are the Tornea, Kemi, Kalix, Lulea, Pitea, Umea, Tana, and Alten. The Alten is navigable about 4 m. from its mouth at the Alten fiord on the Norwegian coast, and its valley is the richest and most extensive in Lapland, differing greatly from all the rest of the territory. The face of the country, from the northern shore of the gulf of Bothnia extending inland for about 80 m., is a plain, covered chiefly with forests of spruce and fir. The ground then rises gradually, terminating in lofty peaks of rock, which in lat. 67° and 69° exceed in certain places 6,000 feet in height. The descent from these ridges to the Arctic ocean is more abrupt than that toward the S. The limit of perpetual frost is 3,500 feet, so that there are many summits half a mile above the snow line. The rest of the surface is generally rocky, and, except in a few favored spots like the valley of the Alten, displays little vegetation beside sturdy forests and a few stunted bushes and perennial moss. The climate is much milder on the sea coast than in the interior. Owing to the influence of the Gulf stream, many of the

fiords on the Atlantic coast never freeze; and as the shores of Russian Lapland are much less indented with harbors or inlets than those of Norway, the Russian government have been making exertions of late years to obtain footing for naval stations within the limits of Norway. The bay of Varanger never freezes; and all the coasts of Lapland are usually free from ice early in May, while the Siberian coasts are ice-bound until the end of July. The temperature of the coast is much more uniform also than in the interior. The mean annual temperature at Cape North is about 80° F. The mercury at this point (lat. 71° 11' 30") seldom reaches 50° in midsummer; in the interior, 3° further S., it rises to 65°. At this latter point also the degree of cold is considerably greater than at Cape North. Summer begins in May and ends in September; and in the valleys, such as that of Alten and one or two others, seed time and harvest are completed within 3 months. Swarms of insects infest the valleys at this season, and the sun being so many hours above the horizon, the heat becomes oppressive. In winter, the sun for many weeks is below the horizon, as in midsummer there are weeks of continuous day. In winter the darkness is relieved by unusual brilliancy of the moon and stars, and by the aurora borealis. The mountains, chiefly of primitive and transition rocks, abound in copper, iron, and other metallic ores, and an English company has profitable copper works near the Alten fiord. Lead, zinc, and arsenic are also found. The vegetable productions embrace the birch, fir, willow, mountain ash, various berry-bearing plants, roses, carnations, and other garden flowers, fruit trees, potatoes, turnips, rye, and wheat. Some of these, however, can only be raised in favorable seasons and the most sheltered situations; in many districts stunted birch trees are almost the only growth, and in others neither plant nor animal can survive. The reindeer is much the most valuable animal of the country. It is the beast of burden; it supplies the dairy, its flesh is the principal food of the people, and its skin affords them garments; its horns are made into useful implements, and its sinews are twisted into cord. Horses, oxen, goats, and sheep are seen among the Swedish and Norwegian immigrants; and in the forests are bears, wolves, gluttons, elk, hares, martens, squirrels, and the Lemming rat. Vast flocks of birds of passage are seen in summer. Aquatic fowl abound; eagles and lammergeyers are found in the mountains, and grouse, partridges, and capercaillies in the valleys. Salmon in the rivers, with herring and other fish, go to make up an apparent abundance. Yet the people are often victims of famine.—Of the 160,000 inhabitants of Lapland, 54,000 are in Finmark, about 60,000 in Swedish Lapland, and about 46,000 in the Russian territory lying west of the White sea. The Lapps proper, numbering about 11,000, from whom the country has its name, are an isolated race, whose origin has been a subject of much dispute. They are generally considered identical in origin

with the Finns, and once occupied the whole territory now called Lapland; but the progress of Gothic, Swedish, and Norwegian conquest pressed them gradually to the borders of the arctic circle. About the end of the 18th century the Laplanders around the gulf of Bothnia were subdued by an association of Swedish fur traders, who threw off their allegiance to their own country, but were reduced by Gustavus Vasa. His son Charles IX. took the title of king of the Lapps. At the present day the vernacular appellation of the Lapps is *Sabme*, "marsh," corresponding with that of the Finns, *Suomilainen*, "inhabitants of the marshes." The Finns refuse to acknowledge relationship, and the Lapps claim it as an honor. There are great moral and physical differences between the two peoples, but a striking affinity of language is a strong argument for their identity of race. The Lapps are of low stature, seldom exceeding 4 feet 9 inches in height, but of great muscular strength, hardy, and active. They have large heads, wide mouths, prominent cheek bones, long pointed chins, small, obliquely placed eyes without eyelids, a swarthy complexion, long, dark, glossy hair, and thin beards. They are subject to many diseases, and rarely live beyond the age of 50. Though not destitute of high moral and intellectual qualities, and noted for simplicity and hospitality, they are dishonest and intemperate. They are much addicted to the use of tobacco. The dress of the men consists of a leather coat, usually sheep skin, tight leather or woollen trousers, reindeer boots without stockings, and a woollen cap. The women wear a dark woollen robe, sometimes ornamented with silver trimmings. All their woven vestments are obtained from the Swedes and Russians. They are divided, according to occupation, into "mountain Lapps" and "sea Lapps." The former wander with their reindeer from pasture to pasture, and pitch their tents in the moss-grown tracts of the elevated country, where the lichens serve as food for the herds and are sometimes ground into flour by the people. The right of the nomadic Lapps to drive their herds promiscuously from one province to another has lately been a subject of dispute between Russia and Sweden, the former government demanding as an equivalent for the use of her territory by Swedish Lapps permission to form fishing stations on the Norwegian coast. The sea or fishing Lapps confine themselves to the shores, and carry on a small trade in fish, skins, beavers, and venison, in exchange for Swedish and Russian brandy, meal, salt, and tobacco. The religion of the people is Lutheran in Sweden and Norway, and Greek in Russia. They are visited by missionaries, schools are established among them, and a knowledge of reading and writing is generally diffused.

**LA PLATA.** See ARGENTINE CONFEDERATION.

**LA PLATA, RIO DE.** See PLATA, RIO DE LA.

**LA POINTE,** a N. W. co. of Wis., bordering on Lake Superior and touching Michigan; area,

about 2,808 sq. m.; pop. in 1855, 447. The surface is low in the N. and undulating in the S. and centre; the W. is occupied mainly by prairies. A large part of the land is occupied by pine forests, and the soil is rich. The productions in 1850 were 250 bushels of Indian corn, 238 of oats, 1,950 of potatoes, and 45 tons of hay. There were 1 saw mill, 2 churches, and 80 pupils attending public schools. Capital, La Pointe.

**LA PORTE,** a N. W. co. of Ind., bordering on Michigan and Lake Michigan, and drained by Kankakee, Little Kankakee, and Gallien rivers; area, 450 sq. m.; pop. in 1850, 12,145; in 1859, about 33,000. The surface consists partly of rolling prairies interspersed with groves of timber; the soil is generally fertile. The productions in 1850 were 668,949 bushels of Indian corn, 206,016 of wheat, 176,148 of oats, 21,322 tons of hay, and 57,891 lbs. of wool. There were 18 grist mills, 26 saw mills, 2 newspaper offices, 21 churches, and 5,700 pupils attending public schools.—**LA PORTE,** a city and the capital of the preceding county, situated in the N. part of Door prairie, at the junction of the Cincinnati, Peru, and Chicago with the Michigan southern and northern Indiana railroad, 12 m. from Lake Michigan, and 145 m. N. W. from Indianapolis; pop. in 1859, about 7,500. It is a place of active trade, and has a branch of the bank of the state of Indiana, and 1 semi-monthly and 8 weekly periodicals. In 1859 it contained 11 churches (1 Baptist, 1 Christian, 1 Episcopal, 1 Lutheran, 2 Methodist, 2 Presbyterian, 2 Roman Catholic, and 1 Swedenborgian), a steam flouring mill, a saw mill, a planing mill, a tannery, 4 manufactories of agricultural implements, machine shops of the above railroads, and an iron foundry.

**LAPPENBERG, JOHANN MARTIN,** a German historian, born in Hamburg, July 30, 1794. The son of a physician, he was sent by his father to study medicine at Edinburgh, but applied himself rather to historical and political researches. After visiting the highlands and the Hebrides, he went from Scotland to London, where he made a longer residence, studying the English government and constitution. He continued his legal studies at Berlin and Göttingen, and received the degree of doctor in 1816. He was sent by the senate of his native town during the congress of Troppan as minister resident to the Prussian court, and resided in Berlin till in 1828 he was appointed to the charge of the archives of Hamburg. In this office he discovered many valuable historical memoirs that were supposed to be lost, among which were the records of the old cathedral of Hamburg. He also made an important collection of diplomatic notes in a journey through the north of Europe. After the change in the constitution of Hamburg in 1848, he became a member of the new senate. In 1850 he took part as plenipotentiary in the negotiations at Frankfort, which ended with the pacification of Germany by the convention of Olmütz. Many of his his-

torical works, which are marked by a critical and elaborate investigation, relate to the antiquities of the Hanse towns, especially Hamburg, and of northern Germany. Among them are: *Urkundliche Geschichte des Ursprungs der Deutschen Hansa* (2 vols., Hamburg, 1830), a continuation of the work of Sartorius; *Die Geschichte Helgolands* (1831); *Hamburgisches Urkundenbuch* (1842); *Die Elbkarte des Melchior Lorichs* (1847); and *Hamburger Chroniken* (1852). His most remarkable work, both in respect of style and erudition, is the *Geschichte von England* (2 vols., Hamburg, 1834-'7; continued by Pauli, 2 vols., 1853-'5; translated into English by Benjamin Thorpe, under the title of "History of England under the Normans," with additions and comments by the translator, London, 1845-'57). He has made valuable contributions to the *Monumenta* of Pertz, and to the *Encyklopädie* of Ersch and Gruber, and has published editions of several old authors.

LAPWING, a plover of the genus *vanellus* (Linn.). The bill is shorter than the head, slender, and straight, vaulted and curved at the end of both mandibles; wings very long and pointed, with the 2d and 3d quills equal and longest; tail moderate, broad, and even; tarsi longer than the middle toe, rather slender; anterior toes united at the base, hind toe not reaching the ground; claws short and slightly curved. About half a dozen species are described in Europe, South America, and northern Africa. They live in pairs in marshy moors and in dry or open districts, collecting in winter into flocks on the downs and sea shore; their flight is rapid, and accompanied by a fanning noise, which has given them their name, and is performed with numerous singular evolutions and often repeated notes; they run with great speed on the ground. The food consists of worms, slugs, and insects; the nest is made of dried grass, and is placed in a slight hollow in the ground, generally containing 4 eggs; they adopt various stratagems to divert attention from the nest and young. The European lapwing (*V. cristatus*, Meyer) is a very handsome bird, of about the size of a pigeon; the upper parts are deep glossy green; the top of the head, crest, fore part of the neck, and breast black; sides of the neck, abdomen, and base of the tail white; a long delicate crest falls gracefully over the back; the tail feathers, except the outer, terminate in a large black space. The females and young have less metallic lustre, and their tints are less black. It is rather shy, but the males are very pugnacious in the love season; the eggs are greenish, spotted with black; incubation lasts 24 days. The flesh, though generally lean and dry, is esteemed as food, and the eggs are said to be delicious. It is widely distributed throughout Europe, northern Asia, and northern Africa. Some of the foreign species, as the *V. Cayanensis* (Gmel.), have a spur at the fold of the wing, but in other respects resemble the European lapwing; they are very noisy, like most of the plovers. Other lap-

wings of allied genera have fleshy appendages and caruncles at the base of the bill, as well as spurs on the wings, and defend themselves bravely against birds of prey.—For characters of the family, see PLOVER.

LARBOARD, the left hand side of a vessel to a person standing at the stern and looking toward the bow; opposed to starboard.

LARCENY (Fr. *larcin*, Lat. *latrocinium*, theft), the taking and removing, by trespass, of personal property, which the trespasser knows to belong either generally or specially to another, with the intent of depriving him of his general or special ownership therein. To this definition some authorities, but not all, add the further element that the act must be done for the sake of some advantage to the wrong doer. It cannot indeed be doubted that the crime of theft may be fully committed although the act be done without any thought of one's own advantage, and exclusively for the benefit of another; as if he should steal bread or clothing for a hungry or a naked man. Circumstances like these might affect the moral character of the action, and might mitigate the punishment inflicted by the court; but they could not change the legal character of the case. Statute provisions have somewhat modified the common law conception of larceny, and particularly in defining the property which may be the subject of this offence. At common law this was personal property alone; of lands there can plainly be no larceny. But inasmuch as the law conceives that every thing attached to the land or realty partakes of its character, it would not be larceny, independently of statutes, to sever and carry away with felonious intent standing grain, or growing grass, or fruits from trees, or lead or copper fixtures from a building. But if these things were severed at one time and carried away at another, by two persons, or by the same person after an interval of time sufficient to render the two transactions distinctly separate, a larceny would be committed; for the property would become by the severance the personal property of the owner of the realty, and rest as such in his possession before the asportation. The too narrow and technical construction of the common law in this respect has been remedied by legislative enactments. The spirit of the prevailing law in the United States is well expressed in the language of a state statute which provides that "things which savor of the realty, and are at the time they are taken part of the freehold, whether they be of the substance or produce thereof, or affixed thereto, may be the subjects of larceny." It is also essential to the offence that the thing stolen be of some value, though the smallest value, less even than that of the smallest coin, is sufficient. The common law recognizes no value in choses in action, so called, that is, in notes and other personal securities. It esteems them mere evidences of valuable rights; and on the principle that their merely material worth is merged in their representative value, there can be no lar-

oeny of such instruments, nor could a suit be maintained even for the value of the paper upon which they were written, unless they had been, by payment or otherwise, rendered void. This defect of the common law has also been remedied, and, by statutes, bank notes, books of account, notes and other valuable securities, are rendered subjects of larceny. The principle of value is also applied in the case of animals known to the law as *fera natura*. It is the rule of the law that animals wild by nature are not subjects of larceny until they are reclaimed, and then only when they are fit for food. By the criminal law therefore there can be no larceny of dogs and cats and many other animals, however the civil jurisprudence may recognize a right of property in them.—A taking and a carrying away are also essential to constitute larceny, and an indictment for this crime must charge both these acts. If the party accused have for only an instant of time perfect control over the property, any, even the slightest, removal of the whole of it is sufficient. Thus one was held guilty of larceny who had snatched a watch, the guard of which, though for an instant free from the person of the owner, was while being withdrawn by the thief caught and arrested by a button. But where a purse became entangled by its strings with keys in the owner's pocket, though it had been raised from its place and out of the pocket, yet there was not a perfect control of the purse, and consequently no such carrying away as is essential to complete the offence.—The required ownership may be either general or special. Stolen goods restolen from a thief may be alleged in an indictment to be either his property, or that of the true owner. And it is said that one may commit larceny of his own property, if he take it from the possession of his bailee, with the intent to charge him for its loss.—It is further requisite to the constitution of the crime of larceny that there be a coincidence in point of time of two distinct intents, viz., an intent to trespass on another's personal property, and an intent to deprive him of his ownership therein. Therefore, if one too drunken to conceive an intent to steal take property, but surrender it before any such intent is entertained, there can be no conviction for larceny. Nor was this crime held to have been committed in a case where, though there was a trespass, the property was taken with the intention of converting only its use to the service of the trespasser. The rule is that the trespass must concur in time with the intent to steal. This rule may seem to be and perhaps is rather technical than reasonable; but it is firmly fixed in criminal jurisprudence, and a clear apprehension of it is necessary to the right conception of the crime of larceny.—Trespass is a wrongful act of force done to the possession of another. Therefore, in respect to larceny, there can be no trespass against an owner who has not the possession of the property taken. On this principle rests the familiar rule of law, that common carriers and other

bailees cannot commit larceny of the goods intrusted to them, so long as this relation exists; for under their contract of bailment they, and not the owners, have the legal possession of the property, and the essential trespass is therefore impossible. For example, the master of a ship, who steals one of several packages delivered to him to carry, does not commit larceny; but if he first break the package and then steal part of its contents, the offence of larceny is complete. The distinction between the two cases is clear. It is evident that the bailee must be first divested of his legal possession before the trespass is possible. In the former of the cases proposed, although by stealing the package without breaking its bulk he destroys the privity of contract between himself and his bailor, still the act is committed in respect of goods which at the time are in his legal possession; the termination of the contract and the act of conversion are simultaneous. But where the package is first broken, the act of breaking determines the contract of bailment and the right of the bailee to hold the property, for that is on the instant re-vested in the owner. Any act of conversion of the goods to the bailee's own use, after a trespass upon the owner's legal right has destroyed the trespasser's right of possession, completes the offence of larceny. A distinction is to be observed between this legal possession and a mere custody. Thus servants who have a thing in their custody to keep, or clean, or carry, have no right of possession; their possession is their master's possession, and he may at his own pleasure take the thing from their hands; therefore they may commit larceny of any goods in their custody which came to them by delivery from the master, or were otherwise in his legal possession.—In all cases in which the legal possession is rightfully acquired, it is plain that trespass and therefore larceny cannot be possible. This principle may be practically illustrated by the example of lost goods. The finder may lawfully take such goods into his possession. He acquires a special property in them, defeasible only by the owner, and in virtue of this has the legal possession, so that, though he afterward ascertain who the owner is, and with felonious intent convert the goods to his own use, he is not guilty of larceny. To constitute the crime in such cases, the finder must at the time of the finding either know the owner, or have means of knowing him, or have reason to believe that he may be found, and must at that time have the felonious intent of appropriating the goods to his own use. In those states where statutes provide that the finder of lost goods shall advertise them, a neglect to do so and an appropriation of the property would probably be held to constitute larceny.—The essential element and criterion of a trespass is the wrongful force. This force need not be exerted physically. It may consist in the unjust use of legal process. So it is a sufficient trespass to entice away an animal by the

voice, or by offering food. A thief commits a trespass when he has gotten the control of an article by inspiring fear in the owner. In these cases the law refers the surrender of the ownership to the thief's act of force. Not so, however, when one is induced by a fraud to part with his property. Whatever remedy the defrauded owner may have in such a case in civil jurisprudence, in the criminal law there is no larceny; and though the intent of the taker were ever so felonious, yet the owner's consent renders unnecessary the act of trespass without which, as we have seen, the offence is not complete. But if this consent extended only to a surrender of the possession, while the party who received the article intended at the time to steal it, that is, to divest the owner of his ownership, here the taking goes beyond the right conferred by the consent, and invades the property; the trespass is complete, and larceny is committed. For example, if one obtains goods by falsely personating the party who had ordered them, he is not guilty of larceny, whatever be his intent, for the owner means to pass the property in the goods by the delivery. But, on the other hand, if he gets the loan of an article, his concurrent intent being to steal it, the owner's consent avails him nothing, and he commits the crime. The same principle applies to those cases in which an owner delivers goods with the understanding that the property in them is to pass when the price is paid, but the taker's object is to get possession of them without any intention of performing this condition.—The second intent essential to constitute the crime is the intent to deprive the owner of his ownership, or of his whole right of property, in distinction from any mere particular interest in it. So that he is no thief who takes a horse, however wrongfully, with the intention of using and then returning him. Whether it be essential to the offence that it be committed *lucri causa*, as the phrase is, that is, for the sake of some advantage to the aggressor, is not quite certain; but it seems to be the better opinion, as we have already intimated, that it is not.—The common law distinction between grand and petit larceny, which was determined by the value of the thing stolen, is in the United States very generally abolished. Compound larceny is larceny aggravated by taking the thing stolen from the house or person of the party against whom the theft is committed.

LARCH. See FIR.

LARCHER, PIERRE HENRI, a French scholar and author, born in Dijon, Oct. 12, 1726, died in Paris, Dec. 22, 1812. He early distinguished himself by his proficiency in Greek and English literature. In 1767 he engaged in a controversy with Voltaire in which he was thought to have the best of the argument. In 1778 he was admitted a member of the academy of belles-lettres, and on the establishment of the imperial university he was appointed professor of Greek in that institution; but he was then over 80 years old, and had to discharge his du-

ties by deputy. His death was the result of a fall. His reputation chiefly rests on the translation of Herodotus (Paris, 1786), which is valuable for its geographical and chronological notes.

LARD, the oily portion of hogs' fat, separated from the animal tissues by the process called rendering, which is melting it out at the temperature of boiling water, and commonly with the mixture of a small quantity of water. The best and firmest lard is obtained exclusively from the fat which surrounds the kidneys; but the common qualities of commerce are derived from the entire fat of the animal. To render this harder various adulterating substances are added, as mutton suet, starch, potato flour, and even caustic lime. Alum also is often added with the view of increasing its whiteness; and in England common salt and the carbonates of soda and potash have been detected in samples of it. The presence of water and its quantity may be determined by submitting a weighed portion to moderate heat; it escapes in bubbles, and when these cease to appear the loss of weight indicates the proportion. If starch is present, it will cause a solution of iodine with which a particle of the lard is mixed to turn blue or even black. The proportion of the adulterating ingredients sometimes amounts to more than 25 per cent., of which the chief article is some farinaceous substance. Water has been found to the extent of 12 per cent.; alum of 2 to 8 per cent.; and quicklime of 1 per cent. Lard as prepared is run into kegs, but the best qualities are collected in England in bladders, and are distinguished by the name of bladder lard. When pure, the article should be firm and white, and entirely free from taste or smell; it should melt at 212° F. without bubbling, and without depositing any sediment; the melted fluid should be nearly as clear and transparent as water. Its melting point varies from 78.5° to 87.5° F. Its composition in 100 parts, as given by Braconnet, is: stearine and margarine 88, oleine 62.—Lard is extensively used in culinary operations as an article of food; it enters into the composition of pastry, and is the material in which fish and other articles are commonly fried. In this operation the presence of flour is sometimes indicated by the substances fried adhering to the pan. In pharmacy lard is the material which forms the bulk of most of the ointments and cerates. A good article for this use, that contains no noxious ingredients, and is not liable to melt in warm climates, is difficult to be procured. The substance is also employed for lubricating machinery, for which use it is particularly important that it should be free from glutinous adulterants.—By the separation of the stearine and margarine from lard the oily product called lard oil is obtained. The manufacture of this is carried on to an immense extent in Cincinnati, where, as seen in the article CINCINNATI, its value is estimated at \$1,817,480 per annum, and that of lard at \$1,282,453. Of the stearine are made candles valued at \$1,834,972, and

other portions of lard enter into the production of soap, the value of which is rated at \$208,940. In 1850 it was estimated that 11,000,000 lbs. of lard would be made into stearine and lard oil, the stearine amounting to  $\frac{1}{4}$  of the whole, and the oil to 24,000 barrels of 42 gallons each. A large portion of this oil is sent to France, where by the skill of the chemist it is incorporated with olive oil, to the amount of 60 or 70 per cent., the mixture then coming back to be sold as pure olive oil. Some interesting properties of lard when combined with rosin, in the proportion of 3 parts by weight of lard to 1 of rosin, were communicated by Prof. Olmsted to the American association at their meeting in New Haven in 1850. When melted together, the mixture is semi-fluid in cold weather. When applied to leather, it renders it very soft and impermeable to air and moisture, and it is particularly well adapted for lubricating the pistons of air pumps, as it is found to protect the brass from corrosion, which the ordinary lubricants induce. The rosin appears to prevent the formation of an acid in the lard, and thus the compound is well adapted to protect the surface of any metal from rust. When used for iron, a little powdered graphite may be added. When the mixture is used instead of other oily substances for making soap, the tendency of this to become rancid when wet and remaining damp is checked. Other uses readily suggest themselves. As an illuminating agent in solar lamps, Prof. Olmsted found lard oil combined with rosin superior for a time to lard oil alone, but the wick after a time became clogged, lessening the brilliancy of the light.—Over 28,000,000 lbs. of lard were exported from the United States in the year ending June 30, 1859, valued at nearly \$3,300,000.

LARDNER, DIONYSIUS, LL.D., a British writer on physical science, born in Dublin, April 3, 1798, died in Paris, April 29, 1859. After 4 years' experience in the office of his father, a solicitor, he entered Trinity college, Dublin, in 1812, and was graduated in 1817. He continued a resident member of the university until 1827. During his college career he evinced an extraordinary aptitude for mathematical studies, and gained between 15 and 20 prizes in metaphysics, pure mathematics, natural philosophy, astronomy, and moral philosophy. He took orders, and was for some time chaplain at his college; but he subsequently laid aside the title of reverend and desisted from all clerical functions. During his residence at the university he published various mathematical works, including an edition of the first 6 books of Euclid, with a commentary, and contributed a number of articles on mathematical subjects to the "Edinburgh Encyclopædia" and the "Encyclopædia Metropolitana," and a series on various branches of natural philosophy to the "Library of Useful Knowledge." In 1828 appeared his "Popular Lectures on the Steam Engine," for which he received a gold medal from the royal Dublin society. Upon the establishment of the London

university he accepted the professorship of natural philosophy and astronomy; and fixing his residence in London in 1828, he published in the same year a "Discourse on the Advantages of Natural Philosophy," and an "Analytical Treatise on Plane and Spherical Trigonometry." This was followed by the "Cabinet Cyclopædia," commenced in 1830 and continued till 1844, embracing 182 vols. 12mo. In this work Dr. Lardner secured the coöperation of the most eminent authors of the day in every branch of literature, and many of the treatises, historical, scientific, or economic, are still regarded as standard works. His own contributions comprised treatises on arithmetic, geometry, heat, hydrostatics and pneumatics, and mechanics, the last in conjunction with Captain Kater, each in 1 vol., and "Lardner and Walker's Treatise on Electricity and Magnetism" (2 vols.). While engaged on this work he wrote occasional articles on physical science and its application to the useful arts for the periodicals, and was frequently before parliamentary committees as a witness in behalf of railway companies. In 1840 he eloped with the wife of a Captain Heavyside, and came to the United States. He was sued for damages, and a verdict for £8,000 was entered against him. He married this lady after her husband's death. During 5 years' residence in America he delivered in the chief cities a series of lectures, which were published and have passed through 15 editions. On his return to Europe in 1845 he settled in Paris, where he resided until his death. His remaining works are: "Railway Economy" (8vo., 1850), valuable for its statistics; "Handbook of Natural Philosophy and Astronomy" (2 vols. 12mo., 1851-'2); "The Great Exhibition Reviewed" (12mo., 1852); the "Museum of Science and Art," a series of excellent popular treatises on the physical sciences and their application to the industrial arts, commenced in 1854 and completed in 12 vols. 12mo.; and handbooks of "Natural Philosophy and Hydrostatics," of "Pneumatics and Heat," of "Natural Philosophy and Mechanics," of "Natural Philosophy, Electricity, Magnetism, and Acoustics," and of "Natural Philosophy and Optics" (8vo., 1854-'6). His life was one of incessant labor, and few men have done more to diffuse scientific knowledge among the people.

LARDNER, NATHANIEL, an English Unitarian divine, born in Hawkshurst, Kent, in 1684, died there in 1768. He was educated at London, Utrecht, and Leyden, and was the author of many valuable theological works. That on which his fame chiefly rests is his "Credibility of the Gospel History" (5 vols. 8vo., 1757). There are two complete editions of Dr. Lardner's works, the last in 10 vols. 8vo. (London, 1828), and the other in 5 vols. 4to. (London, 1815).

LARES, a class of inferior divinities or protecting spirits in ancient Rome, domestic and public. Their worship was closely connected with that of the Manes, but only the spirits of the good were honored as Lares. The household Lares were headed by the *Lar familiaris*,

who was revered as the founder of the family. When the latter changed abode, he followed them. The worship of the public Lares is said to have been introduced by Servius Tullius; it was renewed by Augustus. They were considered as the protecting spirits of the city, and had a temple in the Via Sacra. There were others who were regarded as presiding over the several divisions of the city, over the rural districts, high roads, &c. In great houses the images of the household Lares had their separate apartment, called *adricula* or *lararium*. Their worship was simple; they received offerings in *patella*, especially on the calenda, nones, and ides of every month. On joyful occasions they were adorned with wreaths. (See *PENATES*.)

LARISSA (Turk. *Yenitöher*), a town of European Turkey, in the district of Trikala, forming part of the province or eyalet of Salonica, in lat. 39° 52' N., long. 22° 40' 15" E.; pop. about 25,000, including 15,000 Turks, and the rest Greeks, Jews, &c. It is situated on a gently rising ground on the river Selembria (anc. *Pe-neus*), crossed here by a bridge of 10 arches. Larissa is the seat of a Greek archbishop and of a Turkish pasha, possesses some manufacturing establishments, and trades in the products of the country.—Larissa was an important town in the ancient Grecian province of Thessalia, and celebrated for its bull fights. It is said to have been founded by Acrisius, king of Argos. In process of time its inhabitants attained considerable power, and became lords of the surrounding plain, and the town the capital of Pelasgiotis. In the Peloponnesian war they supported Athens against Sparta. They were afterward reduced to subjection, in common with the other Thes-salians, by the Macedonians under Philip, the father of Alexander. On the overthrow of the Macedonian kingdom their city was taken by the Romans, with whose destinies those of Larissa were bound up till the capture of Constantinople by the Turks.

LARISTAN, a S. province of Persia, bordering on the Persian gulf, and bounded landward by Kerman and Fars; area about 16,000 sq. m. It is one of the poorest divisions of the empire, consisting mainly of an arid sandy waste, with salt steppes and several mountainous elevations, the highest of which are Mounts Tcharek, Kor, Khalatu, and Nabent. There is a scarcity of water, the principal river being the Div-rood, and there is little or no agriculture beyond the raising of small quantities of wheat, barley, and dates. The coast is occupied by Arabs, who live under their own sheik, and pay an insignificant sum for tribute. Capital, Lar.

LARK, a conirostral bird of the family *alaudida*, coming in many respects near the finches. The family characters are: a short and conical bill with the frontal feathers extending along the sides; the first primary very short or wanting; the tarsi scutellate before and behind; the hind claw very long and nearly straight; the tertials greatly elongated beyond the secondaries and nearly as long as the primaries. The genus

*alauda* (Linn.) belongs to the old world, and is found on plains and cultivated lands, migrating to the south in winter; many species sing while rising into the air in large circles or in a perpendicularly spiral manner to a very great height; the flight is undulating; they walk and run with ease. The food consists of grains, small seeds, grasshoppers, gnats, and small worms; the nest is usually placed in the grass on the ground. The sky lark or field lark (*A. arvensis*, Linn.), so celebrated in poetry for its song, is very generally distributed over Europe, Asia, and northern Africa. It is about 7½ inches long and 15 in extent of wings; the general color of the upper parts in both sexes is light reddish brown with darker streaks, the fore neck the same with brownish black spots, the sides streaked with dusky, the lower parts dull white, an obscure brownish white band over the eye, the quills and the outer tail feathers edged with white, and the iris hazel. Though the plumage is dull, the form is elegant; its song is not finely modulated nor mellow, but it is exceedingly cheerful and prolonged, making the welkin ring in the sunny days of spring, and in early morning sounding from on high when the sprightly songster is entirely out of sight; this, combined with its extraordinary power of flight, has associated the lark with the most delightful recollections of rural life. It would be very difficult to imitate its song musically; it is occasionally uttered when the bird is on the ground, but usually as it commences its flight; the character of its different strains is such that it is said that one accustomed to the song can tell whether the bird be ascending, stationary, or descending. When on the ground larks are in the habit of crouching, so as to be perceived with difficulty; they rarely if ever alight on trees. They begin to pair in early spring, at which time their song begins, continuing until the middle of autumn; the 4 or 5 eggs are greenish gray, irregularly freckled with darker. The lark rests on the ground at night; its principal enemies are weasels and the smaller hawks. Its flesh is eaten, though inferior to that of the thrushes. It is often kept as a cage bird, even in America, as it sings nearly as well in confinement as when at liberty; to prevent injury from its soaring propensities, it is usual to pad the top of the cage.—The wood lark (*A. arborea*, Linn.) resembles the preceding in plumage, but is a smaller bird, being 6½ inches long, with an extent of wings of 12 inches; the habits are like those of the sky lark, except that it inhabits woody places and frequently perches on trees; the song, though less diversified, is more melodious, and has been considered inferior only to that of the nightingale; the eggs are pale yellowish brown, with darker lines and freckles. The crested lark (*A. cristata*, Linn.) has the head surmounted with an erectile tuft of feathers; it is stouter, with longer bill and shorter wings and tail, than the sky lark; it is common in southern Europe. The calandra lark (*melanocorypha calandra*, Boie) is the largest European

species; the color is brown above and whitish beneath, with a large blackish spot on the breast of the male. The habits are nearly the same as in the other species; the song is loud and pleasing; they are usually seen in pairs, and in autumn are very fat and esteemed as food; they are found in southern Europe. Other genera of the foreign larks are *pyrrhulauda* (A. Smith), found in flocks in Africa and India; *megalophonus* (Gray), from the dry plains of southern Africa; *mirafra* (Horaf.), from India and northern Africa; and *corthis* (Swains.), from Africa and Europe.—The only genus of the family found in North America is *eremophila* (Boie), differing from *melanocorypha* chiefly in having no spurious first primary; it has a pectoral crescent and cheek patches of black. The American sky lark or shore lark (*E. cornuta*, Boie; genus *otocoris*, Bonap.) is about 7½ inches long, with an extent of wings of 14 inches; the color above is pinkish brown, streaked with dusky on the back; a broad band across the crown, patch from bill below the eye, crescent on throat, and tail feathers black; frontal band over eye, under parts, outer edge of wings, and tail white, and chin and throat yellow; the colors are lighter in some specimens than in others, especially in winter. The principal peculiarity in the plumage consists in two erectile pointed tufts of feathers on the sides of the head, somewhat resembling the ears of the owls. It is distributed from Labrador over the prairies and desert plains of North America, visiting the Atlantic states especially in winter, when it is very fat and much esteemed as food. Audubon found this lark breeding on the desolate shores of Labrador, making its nest in the mosses and lichens in the beginning of July; the eggs, 4 or 5, are grayish, with numerous pale blue and brown spots; it returns to the south in the early part of September. The song of the males on the wing is very sweet, though comparatively short; the food consists of seeds, insects, and larvae, and minute crustaceans on the sea shore. The horned lark of Europe and northern Asia (*E. alpestris*, Boie) is considered a distinct species; the habits are the same.—Birds of the family *sytiolidae*, of the genus *anthus* (Licht.), generally called larks, will be described under TITLARK; the red-breasted and meadow larks are starlings, of the family *icteridae*, and will be noticed under STARLING and MEADOW LARK respectively.

LARKSPUR. See DELPHINIUM.

LARNED, SYLVESTER, an American Presbyterian clergyman, born in Pittsfield, Mass., Aug. 31, 1796, died in New Orleans, Aug. 31, 1820. He was the son of Col. Simon Larned, an officer in the war of the revolution, and afterward representative in congress. He received his collegiate education at Middlebury, Vt., studied theology at Princeton, N. J., and was ordained in July, 1817. His earliest efforts showed such rare gifts of eloquence as had scarcely been witnessed since the days of Whitefield. In the autumn and winter following his ordination, he

proceeded to New Orleans by the way of Detroit, Louisville, and the Mississippi river, preaching whenever opportunity offered during the three months occupied in the journey. At New Orleans his eloquence made a profound impression on the public mind; an impression to which his personal character, his earnest devotion to his work, and a magnetic influence over men which characterized him alike in and out of the pulpit, added strength. A church was soon organized, and a congregation collected, over which he was settled as pastor, and a large church edifice erected. In the summer of 1820 the yellow fever broke out in New Orleans with unusual violence, and he was urgently entreated to seek safety in flight; but he refused to desert the post of duty, and fell a sacrifice to his fidelity. It is seldom that the death of one so young has caused a sensation of sorrow so universal and so profound as that which followed the announcement of his departure. A memoir of his life, with a collection of his sermons, was published in 1844 by the Rev. R. R. Gurley.

LA ROCHEFOUCAULD, FRANÇOIS VI., duke, prince of Marsillac, a French author and moralist, born Dec. 15, 1618, died March 17, 1680. He was in boyhood withdrawn from school to enter the military service, and at the age of 16 was engaged as an officer at the siege of Casale. Of a naturally timid, irresolute, and melancholy character, as he himself has recorded, and unfitted to be a political partisan, he was immediately involved in the intrigues which distracted the court. His father was banished to Blois in 1632 for some connection with the revolt of Gaston of Orleans, and he himself shared his exile, being suspected of hostility to Cardinal Richelieu on account of his intimacy with the friends of Queen Anne of Austria. At Tours he met in 1637 the duchess of Chevreuse, then in correspondence with the queen and the Spanish court. He entered with zeal into the intrigues of women against the cardinal; obtained permission to return to Paris at the moment when the queen, accused of communications with Spain, was subjected to a sort of judicial examination; and, in his devotion to her, accepted her proposal to guide her and Mlle. d'Hautefort in flight to Brussels. He had made preparations for this purpose, when he was discovered to have favored the flight of the duchess of Chevreuse into Spain, and was thrown into the Bastille. Released after 8 days, he went into retirement at Vertemil, preferring to adhere to the queen rather than to accept favors offered by the cardinal. There he lived as a country gentleman, an amateur of dogs, horses, and wines, at the same time corresponding with the enemies of Richelieu and participating in the projects of Cinq-Mars and De Thou. He returned to the court after the death of the cardinal (1642), was received with kindness but was unrewarded by the queen and Mazarin, and showed his resentment by attaching himself to the duke d'Enghien and forming a *liaison* with his sister, the duchess de Longueville, his devo-

tion to whom for several years was merely a matter of interest and calculation. In the wars and intrigues of the Fronde he served the party of the parliament, proved his valor in the defence of Bordeaux (1650), received a wound in the face, which for a time deprived him of sight, in the fight in the faubourg St. Antoine of Paris, and on the conclusion of peace abandoned the pursuits of ambition for a life of repose and reflection. He described his occupations thus far as a "business for fools and wretches, with which honorable and well-to-do persons should not mingle." To his brilliant and troubled relations with Mme. de Longueville succeeded the friendship of Mme. de Sablé, Mme. de Sévigné, and Mme. de Lafayette; his house became a resort of those most distinguished for wit and culture, of Boileau, Racine, and Molière; and the charms of conversation and the labor of composition displaced the agitations of public life. The subtlety of reflection and habits of meditation, which made him irresolute and unskilful in action, appear in his writings; and some of his severe judgments may be regarded as his retaliation for having been surpassed in practical skill by those whom he excelled in understanding. The first fruit of his leisure was his *Mémoires* (Cologne, 1662; 3d ed., 1664), which are among the most interesting memoirs of the intrigues against Richelieu and of the period of the Fronde. Three years later he published his *Réflexions, ou sentences et maximes morales*, a volume of 150 pages containing 860 detached thoughts; the first book, according to Voltaire, written in Europe after the revival of letters in a lively, precise, and delicate style, and which contributed more than any other to form the taste of the French nation. The fundamental and pervading thought, that self-love is the motive of all human actions, is presented under so various aspects and with so much acuteness of observation, that every maxim is piquant and suggestive, though few of them may be true. Though his philosophy is not metaphysical, but founded on the ways of the world, and though his statements are rarely absolute, but affirmed to apply only to the usual conduct of the greater number of persons, yet his rigid and persistent reduction of virtues into disguised vices justifies Rousseau in pronouncing it a "sad book." The only thing, he says, that is really injurious and justly condemned by men, is not vice, but crime. A few of the maxims are of a character to refute all the others, as: "Hypocrisy is a homage which vice renders to virtue;" "It is a greater shame to distrust one's friends than to be deceived by them;" "The greatest misfortunes of men are those into which they fall by their crimes." The *Maximes* passed through 5 editions in the lifetime of the author, and have been frequently republished. An excellent edition, prepared by Gratel-Duplessis, and edited by Sainte-Beuve, appeared in Paris in 1858.

LA ROCHEFOUCAULD-LIANCOURT, FRANÇOIS ALEXANDRE FRÉDÉRIC, duc de, a French statesman and philanthropist, born Jan.

17, 1747, died in Paris, March 27, 1829. Having fallen under the displeasure of Mme. du Barry, he found little inducement to attend the court of Louis XV., but passed his time chiefly on his estate of Liancourt, where, under the influence of a visit to England in 1769, he established a model farm. He also established there a school of arts and trades, which became the parent of the institution bearing the same name at Châlons. After the destruction of the Bastille in July, 1789, he was appointed president of the national assembly. His efforts to befriend the king, after the life of the latter had been menaced, having brought him into danger, he took refuge in England, where he was well received by Arthur Young, the well known improver of British agriculture, and subsequently travelled in the United States and Canada. Unable to endure his exile, he returned to France in 1799, and for some years lived in obscurity in Paris. Still busy with philanthropic plans, he aided in introducing vaccination into France, and inaugurated the system of dispensaries in Paris. The emperor Napoleon subsequently bestowed upon him the cross of the legion of honor, and admitted him to the chamber of peers, under his hereditary title. The duke resumed the charge of his estates at Liancourt, and after the restoration became a member of the general council of hospitals, and president of the society of Christian morals, in which capacity he labored to abolish the slave trade, and to suppress lotteries and gaming houses. He was for 23 years inspector-general of the school of arts and trades at Châlons, and a member of various public bodies of an industrial and philanthropic character, from most of which he was removed by the ministry in 1823 in consequence of his liberal political views. As a recompense for this persecution he was admitted a member of the academy of sciences, and the academy of medicine appointed him on the commission destined to replace the committee of vaccination, of which he had been president, and which had been suppressed by government. He subsequently inaugurated the system of schools for mutual instruction, and established the first savings bank in France. He was a voluminous writer on the subjects which interested him, and among his publications are works on pauperism, on public instruction, on savings banks, on prison discipline, &c. Among the fruits of his visit to America were an account of the prisons of Philadelphia (8vo., Philadelphia and Paris, 1796), and "Travels in the United States in 1796-'8" (8 vols., Paris, 1800).

LA ROCHEJACQUELIN, HENRI DU VERGER, comte de, a French royalist, born in the château of La Durbelière, near Châtillon-sur-Sèvres, Poitou, Aug. 30, 1772, killed at Nouaillé, March 4, 1794. His father, the marquis de La Rochejaquelein, having destined him for the career of arms, he was educated at the military school of Sorèze. At the outbreak of the French revolution, with a view of aiding in the defence

of the throne, he entered the constitutional guard of Louis XVI.; but after the massacre of the Swiss guards, Aug. 10, 1792, he retired to his native province, and, disdaining to follow his father into exile, joined his friend and neighbor, the marquis de Lesoures, in the movement organized among the people of La Vendée for the reestablishment of the monarchy. The peasantry having determined to select their leaders from the provincial nobility, the parishes around Châtillon made choice of La Rochejaquelein, who joined his followers at St. Aubin in March, 1793, and addressed them in a brief speech, ending with these words: "I am young and without experience; but I burn to show myself worthy to be your commander. Let us meet the enemy. If I advance, follow me; if I retreat, kill me; if I fall, avenge me!" The peasants, animated by his example, on the succeeding day attacked the republicans at Aubiers with irresistible force; and having effected a junction with the royalists of Anjou, they defeated the enemy in several encounters. At the attack upon Thouars, May 4, La Rochejaquelein, mounted upon the shoulders of Texier de Courlai, helped to detach with his own hands some of the stones from the wall, and was the first to mount it. At the battle of Fontenay, May 16, and the siege of Saumur, June 9, he showed equal intrepidity; and in 5 days the royalist troops took 80 pieces of cannon and 12,000 prisoners, with the loss of fewer than 500 killed and wounded. In the less fortunate engagements at Luçon and Cholet, at which the chief Vendean leaders were killed or disabled, La Rochejaquelein performed prodigies of valor; and upon the assembling of a new army at Varades, on the northern bank of the Loire, whither the Vendéans had fled after their defeat at Cholet, he was chosen generalissimo, as the only one capable of reviving the spirits of the troops. Accepting with reluctance this responsible trust, which seemed incompatible with his extreme youth, he marched toward the coast of Brittany in the expectation of meeting there promised succors from England. On Oct. 28 he occupied Laval, driving out a large body of national guards, and on the 25th sustained an attack from the republicans under Lechelle, which resulted in one of the most glorious victories for the Vendéans during the war. The enemy were driven in scattered parties as far as Nantes and Rennes, losing 12,000 men and 19 pieces of cannon. Elated by their success, the royalists, 30,000 strong, attacked Granville, Nov. 14; but having no artillery with which to breach the ramparts, they received an unexpected check and were obliged to fall back with the loss of 1,800 men. This disaster disconcerted the plans of La Rochejaquelein, who was about to advance to Caen; and to add to his embarrassment a revolt broke out among his hastily assembled levies, whom it required all their commander's powers of persuasion to prevent from returning at once to their homes. As it was, a retrograde march toward the Loire had to be conceded to them. On their way they defeat-

ed a large body of republicans at Pontorson; but the latter, having rallied at Dol, Nov. 21, where they were largely reinforced, opposed the royalists with 85,000 men and a numerous park of artillery. The first attack of La Rochejaquelein's troops was irresistible, and the republicans were driven several leagues beyond the town. But here the left wing of the royalists, disordered in pursuit, was assailed in turn by the republican right and driven back in confusion into the town. A panic seized the whole royalist army, and their leader, after vain endeavors to stay their flight, threw himself in despair in front of a hostile battery in the hope of finding an honorable death. Fortunately a Vendean priest holding a crucifix in his hand was enabled by an appeal to their religious enthusiasm to rally 2,000 of the fugitives, and at length the combat was renewed with a fury unparalleled in the history of the war. For a long time the result was doubtful, but finally the republicans were routed in all quarters and fled toward Rennes, leaving 6,000 killed and wounded on the field. They, however, almost immediately concentrated at a strongly fortified position before Antrain, where another battle ensued, resulting in a complete victory for the Vendéans. On this occasion La Rochejaquelein with difficulty interfered to prevent his troops from retaliating upon their prisoners the dreadful acts of cruelty perpetrated by the republicans. Again the Vendean leaders projected an advance toward the coast for the purpose of opening communications with the English, and again they were compelled by open mutiny among their followers to continue their march toward the Loire. Arriving at Angers Dec. 3, they made a desperate but unsuccessful attack upon the place; and, wearied, disheartened, and encumbered by an immense and fast increasing train of sick and wounded, they retreated toward La Flèche, which La Rochejaquelein entered by a *coup de main*, and thence proceeded to Mans. Here they were attacked, Dec. 12, by 40,000 republicans under Marceau, Westerman, and Kléber, and, although reduced to about 12,000 men fit for duty, they confronted their enemies with unflinching resolution. Owing to the skillful dispositions of La Rochejaquelein the republicans were for a long time held in check outside the walls, but gradually they forced their way into the town, and for hours a terrible night conflict was maintained within the streets. Finally the royalists were overpowered by numbers and forced out of the town in a confused mass. Their leader, who had two horses killed under him and was wounded and overturned in the tumult, endeavored in vain to bring them to a final stand, and was borne off with his followers, who dispersed in various directions, leaving their baggage and almost all their artillery in the hands of the victors. La Rochejaquelein assembled the small remnant of his troops at Laval, Dec. 14, whence they moved to Ancenis to attempt the passage of the Loire. Here he embarked in a small boat

with a few of his men for the purpose of seizing some large vessels on the opposite side of the river; but being attacked by a numerous party of republicans, his men were killed or dispersed, and he was obliged to gain refuge in a neighboring forest. Thenceforth he led the life of a partisan chief, gathering around him a band of followers, with whom he frequently sallied forth from his lurking places upon the republican posts. On one of these occasions, his men being about to fall upon two republican grenadiers, he ran forward exclaiming: "Surrender! I give you quarter," and was immediately shot dead by one of them. His comrades buried him upon the spot, but his body was afterward interred in the cemetery of St. Aubin.—With many of the qualities of a great general, La Rochejaquelein possessed a daring courage, and at the same time a sweetness and humanity of disposition, which identified him with the *preux chevalier* of the age of chivalry. His personal exploits in battle were innumerable, and such was his martial enthusiasm that sometimes before making a prisoner he is said to have offered him the chance of escape by single combat. Although not 22 years of age at the time of his death, he was recognized as the main support of the royalist cause in western France, and his followers exclaimed over his grave: "Now the convention may indeed say that La Vendée no longer exists."—LOUIS DU VERGER, brother of the preceding, and commander of the last Vendean army, born Oct. 30, 1777, killed at Pontdes-Mathis, June 4, 1815. He emigrated with his father at the commencement of the revolution, and, after being employed in the military service of Austria and England, returned in 1801 to France and married the widow of the marquis de Lescure, one of the bravest of the Vendean leaders. He aided in the restoration of the Bourbons in 1814, and after protecting the flight of Louis XVIII. to Ghent in March, 1815, landed at St. Gilles on the Vendean coast, and aroused the ancient enthusiasm of the inhabitants in behalf of the royal cause. With a few thousand men he encountered an imperial division under Gen. Travot near the village of Mathis, and was killed at the commencement of the action.—MARIE LOUISE VICTOIRE DE DONNISSAN, wife of the preceding, born at Versailles, Oct. 8, 1772, died in Orleans in 1857. She shared in the horrors attending the war in La Vendée, and, after the final rout of the royalists at Savenay, escaped almost by a miracle into England. After the death of the marquis de La Rochejaquelein she resided in Orleans. Her *Mémoires* (8vo., Bordeaux, 1815) presents a vivid picture of the revolution in the west of France, derived from her personal experiences.

LA ROMANA, MARQUIS. See ROMANA.

LAROMIGUIÈRE, PIERRE, a French philosopher, born in Livignac-le-Haut, Aveyron, Nov. 8, 1756, died in Paris, Aug. 12, 1837. He was educated in the college of Villefranche-sur-Aveyron under the *doctrinaires*, of which learned

congregation he became a member. From 1774 to 1783 he taught the classics and philosophy in various colleges in the south of France. He held the chair of philosophy in the college of Toulouse from 1784 till the suppression of the religious communities in 1790. Removing to Paris, he became associated with Sieyès and other leaders of the national assembly, and attended the metaphysical lectures of Garat in the normal school. In 1795 he was appointed professor of philosophy in the Prytaneum (lyceum of Louis XIV.), and in the following year was elected a member of the academy of moral and political sciences. On the creation of the tribunate (1799), he became through the influence of Sieyès one of the magistrates designed to guard the interests of the people, but soon abandoned politics for his favorite philosophical studies. In 1811 he was called to the chair of philosophy in the faculty of letters at Paris, and his lectures, which continued for two years, attracted an audience of the most distinguished literary and scientific men of the capital. His professorship was filled by a deputy from 1813, but he continued to be librarian of the university. The academy of moral and political sciences was suppressed at the restoration, but on its reestablishment under the ministry of Guizot in 1832 Laromiguière resumed his place in it. Amid the vicissitudes of his time he passed a quiet life, devoted to science and to friendship, according to his chosen motto: *Bene qui latuit, bene vivit*. His philosophical system is a modification of that of Condillac, and prepared the way for the more decided reaction of Royer-Collard against the reigning ideology. Few writers have treated metaphysical subjects with so attractive a precision and elegance of style. His principal work is the *Leçons de philosophie* (2 vols., 1815-'18; 7th ed. 1858), which embraces the lectures delivered by him in 1811 and 1812, and has been from its first appearance adopted for public instruction in France. In the last two editions his other most important writings have been included with it.

LARREY, DOMINIQUE JEAN, baron, a French military surgeon, born in Baudéan, near Bagnères de Bigorre, in July, 1766, died in Lyons, July 25, 1842. He studied medicine and surgery at Toulouse, and in 1787 went to Paris, where he was appointed surgeon to a frigate in which he visited America. After returning to France he became an army surgeon (1792), and served during the wars of the revolution. It was at this time that he invented the *ambulances volantes*, for which he was rewarded with promotion to the rank of surgeon-in-chief. In 1798 he accompanied the French army to Egypt, where at Aboukir and Alexandria he displayed remarkable bravery. At Austerlitz he attended to the wounded under the heaviest fire; at Eylau he saved a great number of wounded by his daring; at Essling he killed his own horses to make soup for the wounded when other food was wanting; on the battle field of Wagram he received the title of baron; while

in Spain and in Russia he extended the same care to the enemy's wounded as to those of the French. At the battle of Waterloo he was wounded, carried as a prisoner from post to post, and was about to be shot when he was recognized by a Prussian soldier and led to Blücher, the life of whose son he had formerly saved, and by whom he was sent under escort to Louvain. On the restoration, he was summoned by the emperor Alexander to Paris. He was, however, deprived of his pension, though he was made surgeon-in-chief of the royal guard. His pension was restored to him in 1818 by special resolution of the chamber. Napoleon in his will left Larrey 100,000 francs. "If the army ever erect a monument of gratitude," said the emperor, "it should be to Larrey." Two statues were in fact afterward raised to him, one in 1850 in the court of the Val de Grâce hospital, another in the hall of the academy of medicine. After the revolution of July, he travelled in Belgium, southern France, and Italy, for the purpose of studying epidemics. In 1842 he was engaged in inspecting the hospitals in Algeria, where he was attacked by pneumonia; he hastened to return to Paris, but died on the road. His discoveries relative to gun-shot wounds, the cholera, ophthalmia, tetanus, and extraction of foreign bodies from the brain and amputations, were all of the highest importance. There were few branches of surgery on which he did not advance new and valuable views. He was the author of a great number of medical works and memoirs, many of which have been translated into foreign languages.—His son, FÉLIX HIPPOLYTE, born about 1810, studied the medical profession, was with the French army at the siege of Antwerp, and is now surgeon in ordinary to Napoleon III. and medical inspector of the army. He has written several works on medicine and surgery.

**LA RUE**, a central co. of Ky., drained by Rolling fork of Salt river; area, 182 sq. m.; pop. in 1850, 5,859, of whom 672 were slaves. It has a rolling surface and a good soil. The productions in 1850 were 385,275 bushels of Indian corn, 17,578 of wheat, 73,465 of oats, 131,950 lbs. of tobacco, 18,348 of wool, and 17,682 of flax. There were 11 churches, and 500 pupils attending public schools. The Louisville and Nashville railroad passes through the county. Capital, Hodgenville.

**LARYNX.** See VOICE.

**LA SALLE**, a N. co. of Ill., traversed by the Illinois river and its affluents, the Fox and Vermilion; area, 1,050 sq. m.; pop. in 1855, 85,568. It has an undulating surface occupied chiefly by prairies, but in some places well timbered. The soil is of excellent quality. The county abounds in coal mines which yield an enormous revenue. The agricultural productions in 1850 were 637,483 bushels of Indian corn, 253,598 of wheat, 199,875 of oats, 25,179 tons of hay, and 88,063 lbs. of wool. There were 6 grist mills, 11 saw mills, 4 newspaper offices, 11 churches, and 1,405 pupils attending public schools. Capital,

Ottawa.—**LA SALLE**, a city of the preceding co., is situated at the head of navigation on the Illinois river, 16 m. W. from Ottawa and 98 m. W. S. W. from Chicago, at the junction of the Illinois central and Rock Island railroads and at the terminus of the Illinois and Michigan canal; pop. in 1858, 4,400. It is built on a bluff rising from the river, and enjoys a pleasant and healthful situation and great facilities for trade. Eight coal mines are in operation in the vicinity, employing about 1,000 men, and yielding coal of excellent quality. In 1858 the city contained 5 churches (Baptist, Congregational, Episcopal, Methodist, and Roman Catholic), several academies and schools, 2 weekly newspaper offices, a steam flour mill, a distillery, 2 breweries, 5 brick yards, 4 lime kilns, a planing mill, a foundry and machine shop, and manufactories of saleratus, soap and candles, and flint glass. Adjoining La Salle on the W., and separated from it only by an imaginary line, is the city of Peru, with a nearly equal population. The Illinois river is here 900 feet wide, and is crossed by a railroad bridge of 20 arches.

**LA SALLE**, ROBERT CAVELIER, sieur de, a French navigator, born in Rouen about 1635, died in Texas, March 20, 1687. He renounced his inheritance by entering a seminary of the Jesuits, but after diligent studies obtained his discharge, and about 1667 embarked for Canada to seek wealth by commerce or fame by new discoveries. As a fur trader at La Chine (which he so named from a cherished project of seeking by way of Canada a passage to China), he explored Lake Ontario, visited the neighboring Indians, established posts on the upper waters of the St. Lawrence, and was intrusted by Governor Frontenac with the care of the fort where the city of Kingston now stands. On returning to France in 1675 he obtained the rank of nobility, and the grant of a large domain around Fort Frontenac and of the exclusive traffic with the Five Nations. He was thus proprietary of a promising region, when the arrival of Jolliet at Quebec with the news of the discoveries by him and Marquette on the Mississippi induced him to undertake to extend their explorations, to seek the mouth of the Mississippi, and to form plans of colonization in the south-west. He again repaired to France. His projects were favored by Seignelay, minister of marine; and with Tonty, an Italian veteran, as lieutenant, and 80 mechanics and mariners, he returned from La Rochelle, July 14, 1678, to Fort Frontenac. He increased the works there in order to make it the emporium of commerce with the regions which he purposed to explore, established a trading house at Niagara, and spent a year in visiting the Indian tribes and collecting furs. The Griffin, a bark of 60 tons, was launched on the Niagara river in 1679, and he embarked in it with his colony (Aug. 7) for the valley of the Mississippi. He crossed Lake Erie and Lake St. Clair, and reached Green bay, Sept. 2. Meantime his creditors, thinking him lost, were selling at Montreal all his posses-

sions. To prevent this, he loaded his bark with a rich cargo of furs and sent it back, with orders to return immediately. He proceeded with his company in scattered groups in bark canoes nearly to the head of Lake Michigan, where he constructed a trading house and fort and waited in vain for the return of his vessel. With Hennepin and two other Franciscans, and Tonty and about 30 followers, he ascended the St. Joseph's, and traversed a bog to reach the Kankakee, which he descended till he came to an Indian village on the Illinois, probably near Ottawa. On the banks of Lake Peoria he formed an alliance with the Illinois Indians, whose first hostile disposition he skilfully changed to friendship. There, suffering anxiety for the Griffin, while discontent pervaded his company, 1,500 miles from the nearest French settlement, he built a fort which he named *Créve-cœur* (heart-break). Having put Tonty in command in Illinois, and despatched Hennepin to explore the upper Mississippi, he returned (March, 1680) on foot with 8 companions to Fort Frontenac, and learned the ruin of his fortunes by the shipwreck of the Griffin and of another ship which had been despatched with resources for him from France. On his return he found that Tonty had been abandoned by his men, attacked by hostile Indians, and obliged to take refuge among the Potawatamies. Another year was lost in collecting his scattered followers, and on Feb. 6, 1682, he had descended the Illinois to its junction with the Mississippi. As he advanced, he noted the mouth of the Missouri, built a fort near that of the Ohio, and a cabin on the first Chickasaw bluff, raised the cross by the Arkansas, planted the arms of France near the gulf of Mexico, took possession in the name of France of the whole valley, and, on April 9, entered the gulf of Mexico, founded the fort of St. Louis, and gave to the adjacent lands the name of Louisiana. He retraced his steps, delayed a year among the lakes, and reached Quebec in Nov. 1683. He embarked for France, was welcomed by Seignelay as "the delight of the new world," and received a commission according to which all the French and natives of the country from Fort St. Louis to New Biscay were placed under his authority. An expedition for the colonization of Louisiana, with 4 vessels and 280 persons, departed from Rochefort, Aug. 1, 1684, but dissensions immediately arose between La Salle and the naval commander Beaujeu. They passed the coasts of Florida, and must have been near the mouth of the Mississippi on Jan. 10, 1685; but La Salle mistook their position, and the fleet passed on. A few days later he discovered his error and wished to return, but Beaujeu persisted in advancing W. even to the bay of Matagorda. There he determined to end the dissension by abandoning his associate. He disembarked with 280 colonists, most of his munitions were lost in a gale, and the fleet returned, leaving them almost without resources. Thinking himself near the Mississippi, he fortified the post of St. Louis, and made attempts in

agriculture, which were defeated by the ravages of beasts or of the neighboring tribes. Excursions over land and by canoes were alike ineffectual in bringing him to "the fatal river" which he sought, and he traversed a wilderness toward New Mexico, in a vain search for gold mines. The misery of the colonists increased, and Beaujeu's example of revolt began to be followed. La Salle, whose courage and energy had never failed, sought no longer to govern or to animate his followers by gentleness, but made himself a terror to them. Their number was reduced by manifold losses to 37, when, in despair of subduing their opposition or of carrying out any plan with such auxiliaries, he determined, Jan. 12, 1687, to seek by land the country of the Illinois, and thence to pass to Canada. He set out with 16 men, following the track of the buffalo, passed the basin of the Colorado, and reached a branch of Trinity river. They went in groups, and the malignity of two men, Duhaute and L'Arohevèque, who had embarked their capital in the enterprise, found an opportunity for gratification. They quarrelled with and murdered a nephew of La Salle. He suspected and asked one of them about the fate of his relative, when the other fired upon him from an ambush, and he fell dead. "Such was the end," says Bancroft, "of this daring adventurer. For force of will and vast conceptions; for various knowledge and quick adaptation of his genius to untried circumstances; for a sublime magnanimity, that resigned itself to the will of Heaven, and yet triumphed over affliction by energy of purpose and unfaltering hope, he had no superior among his countrymen." His life is included in Sparks's "American Biography."

LASCARIS, ANDREAS JOANNES, surnamed RHYNDACENUS, a Greek philologist, and a descendant of the imperial family of Lascaris, born on the banks of the Rhyndacus in Phrygia in 1445, died in Rome in 1535. He went to Italy on the final overthrow of the Greek empire, and found a refuge at the court of Lorenzo de' Medici, who sent him twice to Greece to collect valuable MSS. Before his return thence the second time Lorenzo died, and Lascaris, at the invitation of Charles VIII. of France, removed to Paris in 1495, and began to teach Greek publicly. In 1503 Louis XII. appointed him ambassador to Venice. In 1513 he went to Rome on the invitation of Leo X. to take charge of the Greek college and press lately founded there, and published editions of many of the Greek classics. In 1518 he returned to Paris, and assisted Budæus in forming the royal library at Fontainebleau. He was subsequently commissioned by Francis I. to proceed to Venice for the purpose of procuring Grecian youths to officiate in the Greek college of which that monarch then contemplated the foundation in the French metropolis; but being importuned by Paul III. to return to Rome, he did so, and died a few months after his arrival there. He edited the works of several of the Greek poets, and translated into Latin some military trea-

tises of Polybius.—See Villemain, *Lascaris* (Paris, 1825).—CONSTANTINE, a Greek grammarian, of the same family as the preceding, born in Constantinople, died in 1493. On the capture of his native city by the Turks he repaired to the court of Francesco Sforza, duke of Milan, who intrusted him with the education of his daughter. He subsequently visited Rome and Naples, in both of which cities he taught Greek and rhetoric. A few years later he removed to Messina in Sicily, where he established a school which enjoyed great celebrity while he lived. He bequeathed his library and MSS. to the senate of Messina. These were afterward carried to Spain, and are still preserved in the Escorial. His *Grammatica Græca* (Milan, 1476) was the first Greek book printed.
